FLY WITHIN THE BOOK ONLY TEXT
PREFACE

WITH this volume of the Britannica Book of the Year the story of the '40s is brought to its close. For the second decade in the lifetimes of many men and women the world, and Europe more than the other continents, is climbing back to peacetime economy after a holocaust. In this one respect the record for 1949 is almost an encouraging one. Many articles in the Book of the Year speak of industrial and business effort made and rewarded: indeed, if more and more production were the complete answer to 20th century difficulties man, in spite of some shortage of food, would have little to fear. But other articles in the Book of the Year tell of the less successful struggle to promote peace. Ideologically the world is divided into factions, clear cut as never before, and as yet there is no sign that the two sides are approaching a new and lasting understanding. Fortunately it is not the job of the Book of the Year to prophesy. Its only endeavour is to record happenings and, as faithfully as possible, the statements of those whose opinions and actions shape contemporary history.

The Britannica Book of the Year 1950 contains a number of new entries. Included among them are COUNCIL OF EUROPE, NORTH ATLANTIC TREATY and MACEDONIAN PROBLEM. This year attention is especially drawn to these, as it is to the presentation of the long statistical sections at the close of the articles on France, Germany, Great Britain, the United States and the U.S.S.R. All national articles end with statistical summaries but these, for their outstanding importance, are exceptionally full.

To the other new titles it is impossible to draw particular attention, unless exception is made for the charmingly written entry on COUNTRY LIFE. But all the 752 titles have the same purpose, accurately to report and interestingly to describe the events of 1949: it is the earnest hope of their 492 British, American and European authors that they in fact do so.

JOHN ARMITAGE
London Editor.
EDITORS AND CONTRIBUTORS

WALTER YUST, Editor-in-chief of Encyclopaedia Britannica

JOHN ARMITAGE, London Editor

(Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.)

A.A.P. ALEXANDER ALEXANDROU PALLIS, B.A. Minister Plenipotentiary attached to the Greek Embassy; Director, Greek Office of Information, London. Author of Greece's Anatomical Venture—and After; etc.

A.B.C. ALBERT B. CHANDLER. U.S. Baseball Commissioner.

A.Bl. ALAN LEIGH BLAIR. Translator and writer on Scandinavian literature.

A.C. ARTHUR C. CHRISTIE; M.D. Chief, Department of Radiology, Doctors Hospital Medical Centre, Washington, D.C.

A.Ck. ARTHUR CROOK. Literary critic, London.

A.Ch. ALLISON DANZIG. Member of sports staff, The New York Times, New York. Author of The Racket Game; etc.

A.D. Anthony David Lees, M.A., Ph.D. Senior Scientific Officer, Agricultural Research Council, Unit of Insect Physiology, Great Britain.

Wilson School of Public and International Affairs, Princeton
University, Princeton, New Jersey.

X. ANONYMOUS
DIARY OF EVENTS, 1949

JANUARY

1: Great Britain. The British Nationality act, 1948, came into operation.

2: Indonesia. General Spoor, commander of the Netherlands forces, declared that action in Java had ended on Dec. 31.

3: South Africa. Dr. Mears, secretary for native affairs, announced that the government intended to abolish the Natives' Representative council.

5: Germany. Otto Grotewohl, joint chairman of the Socialist Unity party, announced that the Communist party of Western Germany had decided to separate from the Socialist Unity party.

6: British. The prime ministers of the United Kingdom and Northern Ireland met in London. It was re-affirmed that "no change shall be made in the status of Northern Ireland without Northern Ireland's free agreement."

7: India. The plebiscite arrangements for Kashmir, proposed by the United Nations, were accepted by the Indian and Pakistani governments and published in Kashmir.

9: Scandanavia. It was announced that ministers of Sweden, Norway and Denmark had met at Karlstad, where defence matters were discussed.

10: China. General Chen Cheng, governor of Formosa, declared that the island would be used as a stronghold against Communism.

11: Argentina. The draft of a new constitution was published. It contained a provision by which the president or vice-president could serve two consecutive terms of office.

12: France. The Council of Ministers agreed on the immediate reduction in the prices of certain basic commodities.

13: Pakistan-India. A conference between the two dominions at Karachi ended with agreement on several matters concerning evacuee property.

14: Great Britain. At the conclusion of discussions in London between Ernest Bevin and Robert Schuman it was announced that views had been exchanged on current international problems.

15: China. Mao Tse-tung broadcast the terms on which he would insist for peace with the Nationalists.

16: Poland-Great Britain. A five-year trade and finance agreement was signed in Warsaw, providing for an exchange of goods worth £130 million.

17: Rumania. A law was passed introducing the death penalty for offences against the state.

18: South Africa. Serious riots broke out between Indians and Afrikaners in Durban.

19: Turkey. The government led by Hasan Saka resigned.

20: Western Union. The defence ministers of the five member countries met in Brussels.

21: China. General Chiang Kai-shek retired from the presidency and General Li Tsung-jen became acting president.

22: Greece. A government decree abolished the police and replaced it by a militia.

23: India. The conference in Delhi on Indonesia ended, having adopted three resolutions, the first of which was forwarded to the Security council.

24: Japan. Elections were held for the House of Representatives. The Democratic-Liberal party obtained 264 seats out of a total of 466.

25: France. The government granted de facto recognition to Israel.

26: Scandinavia. Ministers of Sweden, Denmark and Norway concluded a three-day meeting in Copenhagen, on economic and defence matters.

18: Great Britain. Sir Basil Brooke, prime minister of Northern Ireland, was received in London by Mr. Attlee. The government recognized the republic of Korea.

19: Great Britain. The government declined the Chinese government's invitation to assist in mediation in China.

20: Greece. M. Sophoulis formed a government of 10 Liberals, 12 Populists and 6 other members.

22: India. A conference on Indonesia summoned by Pandit Nehru, opened in Delhi, 19 countries were represented.

23: United States. Harry S. Truman was inaugurated as president.

24: France. The government published details of the issue of a 5% loan to raise 100,000 million francs for reconstruction.

26: China. Peking surrendered to the Communists.

27: Rumania. A government decree abolished the police and replaced it by a militia.

28: India. The conference in Delhi on Indonesia ended, having adopted three resolutions, the first of which was forwarded to the Security council.

29: Japan. Elections were held for the House of Representatives. The Democratic-Liberal party obtained 264 seats out of a total of 466.

30: France. The government granted de facto recognition to Israel.

31: Scandinavia. Ministers of Sweden, Denmark and Norway concluded a three-day meeting in Copenhagen, on economic and defence matters.

2: Great Britain. The report of the Lysksey tribunal was issued.

3: Eastern Europe. The formation of a Council for Mutual Economic Assistance between the U.S.S.R., Bulgaria, Czechoslovakia, Hungary, Poland and Rumania was announced.
DIARY OF EVENTS, 1949

Israel. The first parliamentary elections were held. Mapai (Labour party) emerged as the largest party with 46 seats out of 120.

26: Great Britain. Mr. Bevin defended his Palestine policy in the House of Commons. The House supported him by 283 votes to 193.

Australia. The Nationality Citizenship act came into operation.

China. The government announced that its offices would be moved from Nanking to Canton by Feb. 5.

Rumania-Poland. A treaty of military assistance and friendship was signed in Bucharest.

United States. An international wheat conference opened in Washington. Fifty-five countries were represented.

27: Argentina. Miguel Miranda, chairman of the National Economic council, resigned and was succeeded by Ramón Cerezo.

Eire. The leaders of the main political parties met in Dublin to consider means of assisting partition candidates in the Northern Ireland general election.

Greece. Terms were published in Belgrade under which the "free government" would be prepared to co-operate with the government in Athens.

Turkey. Athmigoras I was enthroned as Oecumenical Patriarch.

West Germany. The foreign ministers of the Brussels treaty powers met in London.

28: Czechoslovakia. General H. Pila, former deputy chief of the general staff, was sentenced to death for espionage.

United Nations. Dr. van Royen (Netherlands) opposed the four-power resolution on Indonesia before the Security council. It was subsequently adopted.

29: Israel. De facto recognition was granted by Great Britain, Belgium, the Netherlands, Luxembourg, Norway and New Zealand. Israel had now been recognized by 33 states.

Iran. A note was received from the Soviet Union requesting information about the North Atlantic treaty.

United Nations. The commission for Indonesia held its first meeting in Batavia.

30: Germany: Western Zones. The Centre party rejected a proposal from the Christian Democrat party that the two parties should amalgamate.

Paraguay. President Juan Natalicio Gonzalez was deposed in a revolution led by Dr. Felipe Molas Lopez. General Raimundo Rolon was elected provisional president.

Scandinavia. Talks in Oslo on a common defence pact failed to reach an agreement.

Soviet Union. Marshal Stalin's replies to questions put by a U.S. press agency were published. Stalin stated he had no objection to a meeting with President Truman to consider a "pact of peace."

United Nations. Invitations were sent to Iraq, the Lebanon, Saudi Arabia, Syria, Transjordan and the Yemen to attend the Rhodes peace talks.

Vietnam. At a ceremony at Saigon, Bao Dai and Leong Pignon signed a series of conventions implementing the agreement of March 1949.

31: Indonesia. The United States of Indonesia had been recognized by 18 countries.
BOOK OF THE YEAR

ABDULILAH IBN ALI, Regent of Iraq (b. Ta'if), Hejaz, 1914), son of Sharif Ali ibn Hussein who for a short time was king of Hejaz after the abdication in 1925 of his father King Hussein, Sharif of Mecca and head of the Hashimite family. King Ali also abdicated when driven out by the victorious Ibn Saud in Dec. 1925. He went to live in Baghdad, where he died in 1934. Prince Abdulilah was educated at Victoria college, Alexandria. On the death of his cousin King Ghazi I in a motor accident, he was appointed Regent of Iraq on April 4, 1939, until in 1953 his nephew King Faysal II should attain his majority (at the age of 18). On the outbreak of World War II he sent a telegram to King George VI assuring him of the “unshakable attachment of the government and people of Iraq to the letter and spirit of the treaty of alliance with Great Britain.” After the Rashid Ali coup d’état in April 1941, he had to flee the country; but returned to Baghdad with the British liberating force on June 1, 1941. He paid official visits to Great Britain (Nov. 1943), to the U.S. (April 1945) and to Turkey (Aug. 1945). In Arab politics he had supported the British alliance which had often been attacked by the Iraqi opposition; nevertheless he was forced by the pressure of public opinion to repudiate the treaty of alliance at Portsmouth on Jan. 15, 1948. Prince Abdulilah married in 1948 Faiza al-Tarabuls, 22 year-old daughter of a retired Egyptian chief of police. He visited Great Britain with the Princess in July 1949 and was entertained by the King and Queen at Balmoral. (C. Ho.)

ABDULILAH IBN HUSSEIN, King of Jordan (b. Mecca, 1882), second son of King Hussein of Hejaz, was crowned on May 25, 1946. Of his marriage in 1904 to Emire Musbah, daughter of Emir Nazir ibn Ali, there were five children, including Emir Talal, the crown prince (b. Mecca, 1911). (For his early life see Britannica Book of the Year 1949).

On Aug. 7, 1949, at the conclusion of a 12 days’ visit by King Abdullah to Iran, it was announced that the two countries had signed an agreement providing for collaboration in international problems. On Aug. 18 the king arrived in Great Britain on a 17 days’ visit; on Aug. 23 he dined with Ernest Bevin and on Aug. 27 was entertained at luncheon by King George VI and Queen Elizabeth at Balmoral castle. When in London he declared to the correspondent of the Cairo newspaper El Misri that the creation of Greater Syria, uniting Syria, Iraq, Jordan and Arab Palestine under a Hashimite king, was an obvious necessity. On Sept. 5 he visited Spain for ten days.

ABYSSINIA: see ETHIOPIA.

ACCIDENTS. Road Safety. The principal road safety activity during 1949 was the organization of a national Pedestrian Crossing week from April 3–9, the aim being to focus the attention of all classes of road users on proper observance and use of crossings. Local authorities were asked by the Ministry of Transport to co-operate (Circular 626); 1,100 of them did so. They were urged to equip fully all pedestrian crossing places in time for the week and each locality developed its own ideas. A new type of crossing, a “zebra” crossing, was tried in about a thousand places and a comparison of the use of these with crossings marked only by studs was made. Many novel publicity methods were used and the Royal Society for the Prevention of Accidents produced special propaganda material and suggested programmes for local efforts. In London, a Safe Conduct exhibition was held at Charing Cross underground station, opened on the first day by the minister of transport. Draft regulations on the use of road crossings based on the recommendations of the Committee on Road Safety were prepared by the minister of transport for laying before the house.

The National Safety congress was held in London from Oct. 4–7 and was attended by a thousand local authority delegates and a conference of road safety organizers from all over the country was also held in Harrogate, Yorkshire, during May.

The British section of the International Union of Local Authorities discussed road safety at its conference held at Leamington Spa, Warwickshire, in February. At a subsequent international conference in Geneva, Switzerland, in September, the union discussed a report on safety measures in different countries submitted by Sir Howard Roberts, clerk to the London County Council and chairman of the Ro.S.P.A’s management committee.

The total number of drivers entered in the Society's National Safe Driving competition was 200,000 and 138,596 awards were made during 1949. The War Office and the Air Ministry entered drivers.

Industrial Accident Prevention. A National Industrial Safety conference held in Scarborough, Yorkshire, in May was attended by 450 industrial delegates. Speakers included Sir Geoffrey King, deputy secretary of the Ministry of National Insurance, on the Industrial Injuries act. Regional industrial safety conferences were held in many provincial towns. A second Chemical Works Safety conference was held at Scarborough, Yorkshire, in October and a conference of London member firms was addressed by the minister of labour. Firms in Sheffield, Rotherham, Barnsley, Doncaster and Chesterfield, covering about 200,000 workers, co-operated in a Good Housekeeping week to draw attention to accidents due to untidiness in works.

The chief inspector of factories report for 1947 was published early in 1949. It showed that over 83% of all injuries reported were due to causes other than machinery. Another report likely to have considerable effect on safety work was published; viz., Health, Welfare and Safety in the Non-Industrial Employment. A report by a Committee of Enquiry. The report of the Factory department's electrical branch on Electrical Accidents and their Causes—1947, was also published.

The Ro.S.P.A. produced a new film Your Dog and Mine showing how dogs can be trained in road sense and another film Calling all Motor-cyclists was made in co-operation with the metropolitan police and editors of motor-cycling papers. Static exhibitions, mobile cinemas and touring exhibitions visited many districts. The Ministry of Education published a pamphlet Safety Precautions in Schools explaining ways in which risks could be avoided in physical education, the laboratory, manual and handicraft work. During the year a joint committee of industrial and educational representatives was formed to discuss industrial safety training and guarding of machinery in technical schools. A leaflet on “Tubular Steel Scaffolding” was printed. Investigations by the society included tool handle breakages and the use of colour in industry.

A fourth and fifth volume in the series "I.C.I. Engineering Codes and Regulations (Safety Series)" were produced, entitled Construction and Maintenance (Civil Engineering) and Docks, Wharves and Quays respectively.

Home Accident Prevention. During the year the registrar's general review for 1946 was issued and revealed that 7,883 deaths occurred in the home and everyday pursuits, a slight decrease on previous years. The campaign against home accidents was intensified by a grant made to the Ro.S.P.A. by the Home Office for the provision of lectures, posters and leaflets for this purpose. At the Ideal Home exhibition a stand named "Hazard House" was taken by the Home Office Inter-departmental Committee on Home Accidents, and members of the Women's Voluntary services distributed the society's leaflets.

United States. Accidents caused 98,000 deaths in the U.S. in 1948. This total was exceeded only by deaths from heart disease, cancer and cerebral haemorrhage. Information available up till Oct. 1949 indicated that the 1949 accidental death total would probably drop 5% below 1948. In addition to the deaths, accidents in 1948 also caused about 10 million injuries.

Organized efforts to reduce accidents in the U.S. were led by the National Safety council and affiliated local safety councils throughout the nation. The National Safety council served as a place for group planning and execution by all who took part in the safety movement and it attempted to discover the facts of accident occurrence; to devise or assist in devising engineering, educational and enforcement measures for prevention; to assist in determining engineering requirements for the safe design, construction and use of machines and equipment; to help to draw up model safety legislation; to participate in planning and executing training and educational programmes; to disseminate this information widely to interested groups and to the general public; and to encourage and assist the establishment and activity of community and state safety organizations.

The President's Conference on Industrial Safety was held in March, when 1,500 representatives of management, labour, government and the public met in Washington, D.C., to consider committee reports and develop plans for the reduction of the industrial accident toll.

It appeared, late in 1949, that the year's toll of occupational accident fatalities might be reduced by as much as 6% from the 1948 toll of 16,500.

As the year 1949 drew to a close, it appeared that the number of traffic accident deaths might drop 500 below the 1948 figure of 32,000. This apparent reduction was in the face of an approximate 6% increase in motor vehicle travel. In June 1949 the President's Highway Safety conference met for the third time in Washington, with about 3,000 of the nation's traffic safety leaders in attendance.

In 1949, 23 states had State Farm Safety committees, and 11 states had a full-time farm safety specialist, working through many public and private agencies to spread information on the seriousness of the farm accident problem and on ways and means of meeting it. The president of the United States for the sixth successive year, proclaimed a National Farm Safety week in July 1949, which focused attention on the problem of rural accidents.

Among children of 1 to 14 years of age accidents were responsible for more deaths than the next six death causes combined. Even so, the accidental death rate among children under 14 had dropped about 40% in the last 40 years. School authorities showed increasing recognition during 1949 of the importance of safety education in the classroom, in shops and elsewhere in school life. A specialized feature of school safety work had been the driver training programmes instituted in many high schools throughout the nation. Studies had shown that students who had had this training were involved in fewer accidents than those who had not.

The 1948 toll of deaths in home accidents was 35,000, which was greater than in any other type of accident. Reports
covering 10 months of 1949 indicated that home fatalities would again lead the list, although a reduction of about 6% on 1948 seemed probable. Local and state health departments gave increased attention to accident prevention work, concentrating on home safety. Women's clubs and other organizations and agencies attracting the support and interest of homemakers showed an increasing tendency to include safety in the home as a regular programme activity. During 1949 about 50 out of the several hundred local and state safety organizations throughout the country qualified for acceptance as chapters of the National Safety council. The 37th National Safety congress was held in Chicago, Illinois, in Oct. 1949 with an attendance of approximately 10,000. In addition, about 30 Regional Safety conferences were held during the year.

(R. L. Fo.)

ACHESON—ADULT EDUCATION

ACHESON, DEAN GOODERHAM, United States statesman (b. Middletown, Connecticut, April 11, 1893), was the son of an Englishman who became bishop of Connecticut. On Jan. 7, 1949, President Harry S. Truman appointed him secretary of state to succeed George C. Marshall, who resigned. He was sworn in on Jan. 21. He immediately assumed responsibility for the negotiations with the ambassadors and ministers in Washington of Belgium, Canada, France, Great Britain, Luxembourg and the Netherlands on a defence alliance for the north Atlantic. On April 4, he signed the North Atlantic treaty on behalf of the United States, and in September in Washington presided over the first meeting of the council of the treaty. In May and June he attended the Council of Foreign Ministers in Paris at which German and Austrian matters were discussed. He visited Paris again in November for talks with Ernest Bevin, Great Britain, and Robert Schuman, France. He later visited Western Germany and called upon Dr. Karl Adenauer, the federal chancellor, at Bonn. (See also Britannica Book of the Year 1949.)

History. Kamaran island (22 sq. mi.) in the Red Sea. administered by the government of India after capture from the Turks in 1915, was placed under the personal supervision of the governor of Aden. Rising costs necessitated the revision of the colony's development plan; the revised plan envisaged a total expenditure of £1,063,000 from the colony's surplus balances, £300,000 from Colonial Development and Welfare funds, and £600,000 to be raised by loan. A serious famine, which threatened the eastern protectorate in the spring, was in part relieved by supplies flown in by the Royal Air Force.

Finance. Currency: the Indian rupee (Rs.1 = £r. 6d.). Colony's budget (1947-48): revenue Rs. 12,112,421; expenditure Rs. 9,880,631. (J. A. H.)

ADENAUER, KONRAD, German statesman (b. Cologne, Jan. 5, 1876), the son of a Cologne official. Following a university education at Freiburg-in-Breisgau, Munich and Bonn, and three years as a lawyer, he was in 1906 elected town councillor in his native city, with which his name will always be coupled. Eleven years later he was elected Oberbürgermeister (lordin mayor) of Cologne, an office which he held uninterruptedly for 16 years. During his period of office Cologne university was founded, the stadium was built and the Cologne fair initiated. For a short time in 1919, during the Allied occupation, Adenauer, apprehensive at the spread of Communism in Berlin, espoused the idea of separation of the Rhineland from Prussia. He became a leading member of the Catholic Centre party and in the 1920s was often in the running for the office of German chancellor. From 1917 to 1933 he was a member of the Prussian Landtag and in 1928-33 was its speaker. In 1933 Hermann Göring, as prime minister of Prussia, dismissed Adenauer as politically unreliable. In June 1934 he was arrested and imprisoned for a short time in connection with the Röhm purge; and following the assassination attempt against Hitler on July 20, 1944, he was sent to Brauweiler concentration camp but was later released. After the downfall of the Third Reich the American occupation authorities reinstated Adenauer as lord mayor of Cologne, but the British removed him in Oct. 1945 as "incompetent." In Feb. 1946 he was elected chairman of the Christian Democratic union in North Rhine-Westphalia, became the same year chairman of the C.D.U. for the British zone and on Sept. 1, 1948, was elected president of the parliamentary council drafting the West German constitution or basic law. On Sept. 15, 1949, after the elections to the Bundestag (Federal Diet) of the new West German republic had given the C.D.U. the largest number of seats, Adenauer was appointed chancellor. As a politician he is a constructive conservative, possessed of a supple, organizing mind, determination not without rigidity, and considerable tactical skill. (D. A. Sö.

ADULT EDUCATION. In this article only non-vocational education is discussed. In June 1949 an international conference on adult education convened by U.N.E.S.C.O. brought over 100 delegates representing 29 countries and 32 international voluntary organizations to Elsinore in Denmark. The conference had a fivefold purpose: exchange of ideas and experiences; study of urgent needs and common problems; exploration of new techniques and methods; aid to United Nations in planning its programme; and consideration of means to sustained collaboration. U.N.E.S.C.O.'s second major contribution in the adult field was a seminar held at Mysore, India, in November and December. Delegates from 18 countries, all Asian except 3, and 25 observers from the Indian states and provinces, worked out
a series of recommendations and basic principles regarding rural adult education in Asiatic countries. Four working groups pooled their ideas on promoting literacy, raising health standards, removing economic grievances and instilling the idea of citizenship and social cohesion into undeveloped communities. Their principal recommendations for immediate action were that more women should be invited to help in public work, cottage industries should be revived and established, local self-governing institutions should be set up in areas not yet enfranchised and suitable reading material should be prepared for Asian adults and distributed through new systems of rural libraries.

A general statement of aims unanimously accepted declared that adult education should attempt to support and encourage movements working for the creation of a true culture by which the gaps between the so-called masses and the so-called cultured people might be filled; to foster the true spirit of democracy and of humanity, and to awaken and stimulate in young adults an awareness of life itself.

Among principal topics discussed were the relationship between the state and voluntary bodies, the role of the university, adult education centres and leaders and the exchange of workers, materials and information. The conference resolved, inter alia, that (i) U.N.E.S.C.O. should be invited to set up a representative consultative committee to advise its adult education division; (ii) that U.N.E.S.C.O. should be asked to give special attention to Germany; and (iii) that all countries should be urged to consider women's needs. Shortly after the conference U.N.E.S.C.O. set up an international advisory council on adult education.

As part of its fundamental education programme U.N.E.S.C.O. chose as a discussion theme for 1949 "Food and People." Handbooks, pamphlets, wall charts, picture books, film catalogues and guides were published in several languages for teachers and as background material.

In England and Wales 19 residential short term colleges for adult education, all established since 1944, were in operation. These were maintained by universities, local education authorities, voluntary organizations (alone or in combination), independent trusts and private individuals. They offered, or provided accommodation for, courses on every conceivable topic. Most courses took place between Friday and Monday, but there were also many midweek (Monday to Friday) or longer courses (up to one month) chiefly for occupational groups and vacation schools. In Scotland Newbattle abbey, formerly a long term residential adult education college, was re-opened after wartime requisition.

In May the British Institute of Adult Education (founded 1921) and the National Foundation for Adult Education (established 1946) were amalgamated to form the National Institute of Adult Education (England and Wales). The chief functions of the new body were to provide information, devise machinery for consultation and promote inquiry and research, on behalf of all bodies, statutory and voluntary, engaged in adult education.

In Canada, a Royal Commission on National Development in the Arts, Letters and Sciences was created under the presidency of Vincent Massey, chancellor of Toronto university. It was given the widest possible terms of reference, including broadcasting and television and Canadian cultural relations with international bodies.

In February a delegate conference representative of extramural study groups in the Gold Coast and British Togoland formed a People's Educational association comparable with the British Workers' Educational association. This was a direct result of the extra-mural study courses begun by Oxford university in 1947.

ADVERTISING. Great Britain. British advertising experienced a boom year in 1949. There were several reasons for this, among them the introduction of the six-page daily newspaper in April with corresponding increases for Sunday publications, the 50% increase in the paper ration for magazines in July and the end on May 1 of the complete ban on all forms of electric signs and illuminated window displays which had been in operation since the beginning of World War II. Orders were also made during the year granting more paper for direct mail and poster advertising. Additionally, in Dec. 1948 the chancellor of the Exchequer, in negotiation with the Federation of British Industries, agreed to call off the Voluntary Limitation of Advertising plan, introduced in the previous March. Under this plan British firms which spent more than £2,500 a year on the advertising of rationed goods, luxury products and lines carrying heavy purchase tax gave voluntary assurance that they would cut down outlay on all forms of publicity by 15%. From March 1, 1949, advertisers were freed from this obligation, except to the extent that they promised the chancellor not to exert undue sales pressure in favour of products which were in short supply, thereby stimulating inflation.

Advertisers were not lax in taking up the extra advertising space which became available to them. The Statistical Review of Press Advertising estimated that in the first three months of 1949 expenditure on advertising in the British press totalled £6,490,498, an increase of 22.37% over the

A typical newspaper advertisement of the humorous weekly "Punch" (London)—one of many similar advertisements by "Punch" in 1949.
corresponding 1948 figure of £5,303,922. It was stated also that if the volume of press advertising recorded in the first quarter were to continue in like proportion throughout the year, the total would be about £26 million, only 10% below the figure for 1938. Later, in September, the *Statistical Review* showed that its earlier forecast looked like coming true. It commented on the rise in press advertising expenditure which had developed in April, May and June and calculated that British publishers had, during the first nine months of 1949, shared between them a total of £21,729,488 in advertisement revenue.

The British Transport commission, in publishing its first accounts in September, for the year 1948, showed that a net profit had been made of £2,207,610 from the sale of advertising positions on nationalized transport properties and vehicles. This indicated that advertising was the commission's biggest single money-maker among its non-carrying activities.

The government gave details of its own expenditure on posters. For the 12 months ended Sept. 30, 1949, public poster advertising by or on behalf of government departments cost £530,698. Civil estimates published in March showed that, through the Central Office of Information, the government reckoned to spend, during the year ending March 31, 1950, £867,000 on press advertising, £574,500 on poster advertising, £748,200 on films and £197,000 on exhibitions. All these figures were lower than in the previous 12 months.

The Advertising association held a successful conference at Buxton, Derby, May 28-June 1. Subsequently it was decided to proceed with plans for a world advertising conference to be held in London in 1951 in connection with the Festival of Britain.

A distinctive feature of the press advertisement columns and of the hoardings was their use in political or political-industrial interests. The Conservative party began in April a nation-wide poster campaign designed to build up support for itself at the next general election. A number of industries (steel, insurance, sugar, cement) faced with the prospect of nationalization used advertising to campaign against a change in their present system of ownership.

During the year British advertising executives gave considerable attention to the problem of developing trade in the dollar markets. The peak effort of 1949 in this connection was the establishment in October of an Advertising Advisory committee to the Dollar Exports board. This committee, meeting in London, consisted of representatives of British advertising agencies with U.S. connections and U.S. advertising agencies with offices in Great Britain. The committee's job was to give free advice to British exporters contemplating entering or expanding in the U.S. and Canadian markets.

In June the Royal Commission on the Press issued its report. The commission gave much attention to the effect of advertising on the press and rejected the idea that advertisers influenced the conduct of newspapers. The commission declared: "As long as newspapers are sold to the public for less then they cost to produce, they will need a supplementary source of income. Of the various possible sources of income the sale of their space to advertisers seems to us to be one of the least harmful. The publication of advertisements should not be regarded, moreover, as a departure, under pressure of economic necessity, from the proper function of a newspaper. It is an essential part of the service which the newspaper renders to the community, valuable alike to commerce and industry and to the general public."

**Commonwealth.** Conflict between owners of publicity media and advertisers on the one hand and governments on the other was marked in both Australia and India. In 1949 the Australian Federal government gave up its wartime controls on newspaper advertisement rates and a plan by the New South Wales State government to reintroduce these for newspapers in its own territory aroused considerable opposition from press proprietors.

In India some provincial governments contemplated schemes for the taxation of newspaper advertisements at various rates. Owners of newspapers in India pointed out that, with newspapers circulating across state frontiers, taxation imposed by different authorities on several different scales would be difficult to work and would lead to anomalies. It was agreed by the authorities that taxes on advertisements should be uniform and operated by the central government.

In South Africa a survey carried out by South African Research services (Pty.), Ltd., estimated that in June 1949 some £229,000 were spent on press advertising of branded goods and services in 250 South African publications. The figure for May was £221,000; for April, £228,000. The January to March average was £209,000.

At the International Chamber of Commerce 12th biennial congress, which took place in Quebec, Canada, in June, the I.C.C.'s committee on advertising approved the International Code of Standards of Advertising Practice and the reinstitution of the International Council on Advertising Practice of the I.C.C.

**Europe.** Great Britain's Advertising association joined with Belgium, Brazil, Denmark, Finland, France, Norway, Sweden and Switzerland in establishing the International Union of Advertising at a meeting which took place in Zürich, Switzerland, on Sept. 24. The suggestion that the union should be formed was made by French advertising interests at an international advertising conference in Paris in July 1947. The object of the International union was to bring together the advertising associations representative of all the nations. Paul O. Atthaus, Switzerland, was elected...
ADVERTISING

Also in September the European Society for Opinion Surveys and Market Research adopted a code of standards governing market research practitioners and methods. British advertising, through the Market Research society, sent representatives to this meeting, as did France, Switzerland, Italy, Holland, Belgium, Sweden, Finland and Denmark.

(A. J. Hy.)

United States. The rate of increase in advertising expenditures in 1949 was not so great as in previous postwar years, standing at approximately 5%. The most important single gain was made by newspaper advertising. The $5,400 million spent in 1949 in all media was divided as shown in the Table.

* Estimate by Hans Zeisel, McCann-Erickson, Inc.

Problems facing advertising in 1950, as stated by various leaders, included the following: how to encourage adequate use of advertising to sell the vast volume of goods and services the economy was capable of producing; how to achieve better integration of advertising with merchandising and sales programmes; how to improve measurements of advertising effectiveness; how to secure better public relations through advertising; how to set advertising appropriations to budget more scientifically.

Two new products were introduced during the year, ammoniated dentifrices and anti-histamine cold remedies, that resulted in large space and competitive advertising. During the year the automobile manufacturers moved toward a buyer's market, with the result that their advertising increased and often featured price cuts. In Nov. 1949 the advertising of new passenger cars in newspapers, for instance, was 239% higher than in Nov. 1948.

The year 1949 closed with fair optimism among advertisers. They had passed through the recession of the spring and early summer successfully, and felt that 1950 would be a good year. The Research Institute of America found in a poll of 30,000 member firms that one-third planned to increase advertising appropriations in 1950, less than 7% to reduce them. The Association of National Advertisers' annual survey of its members did not indicate that there would be much increase in spending in 1950.

Newspapers and Magazines. Newspaper lineage was approximately 2% higher in 1949 than in the year before. Media Records reported 2,094,103,004 lines for the first 11 months of the year, a gain of 1-7% over the first 11 months of 1948. The rate of increase in December was faster, so that it was expected the year would end with a gain of about 2% or more. There were continued rate increases, but it was felt that rates were reaching a plateau of some stability.

National newspaper advertising (excluding local retail advertising) fared better, being 15-9% higher during the 11-months' period than for the like months of 1948. The largest gains were made by alcoholic beverages, up 29-8%; dentifrices, up 53-7%; new passenger cars, up 83.0%. Alcoholic beverages and new passenger cars together accounted for 22.8% of all national newspaper lineage during the first 11 months. Advertising of the anti-histamine cold remedies was reflected in a rise of 30.3% for medical advertising in November.

The Magazine Advertising bureau estimated that advertising expenditures in national magazines for the first six months of 1949 were at the annual rate of $450 million, compared with $463 million for the same period of 1948, a decrease of 2.8%.

Radio. The National Association of Broadcasters estimated that gross income of the radio industry was up 4.5% from 1948, but that this gain was almost matched by a rise of about 4% in operating expenses. It predicted a gross income of $435,279,000 in 1949, as compared with $416,720,279 in 1948. National network income at $129,300,000 was down by 3.3%; national spot business at $118,425,000 was up 13.0%; local retail income at $180,025,000 was up 5.3%.

The year in radio was marked by competition among the networks for major advertising accounts, a competition that resulted in several switches of popular programmes. The year was also noteworthy for the decline in popularity of the type of programme marked by contests in which large amounts of merchandise or cash were given as prizes. The Federal Communications commission announced in the year that it intended to ban such "giveaway" programmes but was temporarily restrained by a court order obtained by a producer of syndicated radio shows.

Television. Television was the most exciting advertising medium during 1949, and data on its growth became inaccurate almost as soon as published. The number of television stations jumped during the year from 50 to nearly 100, the number of owners of sets from 1 million to about 3.5 million, the television audience from about 4 million to more than 14 million, the number of television advertisers from 1,000 to 2,000. It was estimated that approximately $20 million was invested in television time sales by advertisers during the year. As advertising increased, time costs approximately doubled, in New York going from an average of $1,000 an evening hour in January to $2,000 in December.

Other Media. Advertising expenditures in outdoor advertising amounted to approximately $78 million, according to Outdoor Advertising Inc. This was approximately the same as for 1948. Advertising revenue of the 41 farm publications measured by Farm Publication Reports, Inc., for the first half of 1949 was $25,044,181, compared with $23,557,027 for the same period of 1948. The volume of advertising in business papers in 1949 was estimated at $215 million, compared with $200 million in the previous year.

The year saw an increase in the use of premiums in advertising and one estimate put their value at $1,000 million, or double the prewar peak. Coupons redeemable in merchandise reappeared on the package of one of the largest-selling
brands of cigarettes. Door-to-door selling also increased, an indication of greater competition in selling. The amount of merchandise moved by this kind of selling was estimated at about $7,000 million.

(\text{D. Sr.; R. A. BN.})

AFGHANISTAN. An independent kingdom in the centre of Asia bounded to the north by the U.S.S.R., to the west by Iran, to the south and southeast by Pakistan and to the east by China (Sinkiang). Area: c. 670,000 sq. mi. Pop. (1947 est.): 12 million. Races: Afghans or Pathans or Pashtuns 53\%; Tajiks 36\%; Uzbek 6\%; Hazar (Photograph 3: 3); others 2\%. Religion: Moslem (Afghans are Sunni, others mainly Shia). Languages: Pashtu, but Tajiks and Hazar speak Persian. Chief towns (pop. 1946 est.): Kabul (cap., 206,200); Kandahar (77,200); Herat (75,600); Mazari-Sharif (41,900). King, Mohammed Zahir Shah (q.v.); prime minister (from May 1946), Sardar Shah Mahmud Khan, the king's uncle.

History. The cold war between Afghanistan and Pakistan continued during 1949. Political circles in Kabul and the Afghan government insisted that Pakistan should constitute the North West Frontier an independent Pathan republic or at least allow the Pathans of the tribal areas on the Pakistan side of the Durand line to opt for Kabul. The press and wireless of Kabul continued to pour out abusive propaganda against Pakistan. The Pakistan government refrained from reprisals and trade between the two countries went on as before; in fact economic co-operation was offered. Railway rates concessions were however withdrawn. Propaganda had not undermined the loyalty of the Pathan tribesmen in the Pakistan hinterland. The stormy petrel of the Afghan frontier, the Fakir of Ipi, was compelled to migrate to Afghanistan where he received a friendly welcome. The British government categorically refused the Afghan request that it should intervene.

The country was in the grip of an economic crisis. The Persian lamb trade, a vital element in Afghan finance, was languishing: Indian import duties paralysed the export of fruit. Early in the year the United States refused the Afghan request for a loan of $600 million. A big American firm had for two or three years been carrying out important work on roads, bridges and irrigation dams. Work was later held up owing to the fading out of Afghan credit, but was to be resumed on the strength of a $21 million loan (repayable in 15 years at 30\%) granted by the Export-Import bank on Nov. 1948. King Mohammed Zahir paid a visit to France in the autumn of 1949.

Education. (1948 est.) Primary schools 400, secondary schools 25, higher schools (lycées) 7, and a university at Kabul with four faculties: medicine (founded in 1932), political science and law (1939), science (1941) and arts (1944).

Agriculture. Two food crops are raised each year—one of wheat, barley or lentils, and the other of rice, millet or maize. Other important crops are cotton, tobacco and fruit. The fat-tailed sheep provide the main meat diet.

Foreign Trade. Principal imports are: tea, coffee, cocoa, cigarettes, spices, oil, cement, minerals, machinery and other manufactured goods. Principal exports are: karakul skins, dried fruit, wool and carpets.

Transport and Communications. There are eight main roads totalling 2,265 mi. Licensed motor vehicles (Dec. 1948): cars 770, commercial vehicles 2,070. There are no railways.

Finance. Monetary unit: afghani with an exchange rate (Nov. 1949; in brackets Nov. 1948) of 47 (57-14) afghanis to the pound.

AGRICULTURE. The year 1949 opened with the promise of continuation of large grain exports from North America and of accelerating progress towards increased livestock production in Europe.

Cereals in the Northern Hemisphere. The European harvest of wheat and rye apart from the U.S.S.R. harvest was 18 million metric tons (48\%) greater in 1948 than in 1947. The harvest of coarse grains, barley, oats and maize, was 7 million tons (16\%) greater. In North and Central America the wheat and rye harvest of 1948 was almost as great as the 1947 record harvest of 47 million metric tons, and the coarse grain harvest was 39 million metric tons (41\%) greater than the 1947 harvest. The United States and Canada were thus able to export during the cereal year ended June 1949 a total of 25-1 million metric tons of grain or 3-8 million more than during 1947-48 and 17-3 million more than the yearly average during the late 1930s.

Together with slightly increased supplies from Australia but reduced supplies from the Argentine and other countries, these North American supplies were sufficient to provide Europe with 17-7 million metric tons of imported bread grains during 1948-49. With greater home-produced supplies from the 1948 harvest, these raised Europe's total bread grain supplies during 1948-49 by 15-4 million metric tons to 72-0 million, which was almost as great a total supply as that consumed in prewar years. Europe's human population had increased 14\% after the late 1930s but a smaller proportion of the wheat supply was fed to livestock in the form of milling by-products or low quality grain; and potato supplies and consumption were much larger. A significant development early in 1949 was that, in Germany, certain low quality cereals became difficult to sell as human rations owing to improved imports and home deliveries of grain. The improvement of the bread grain position in the western world as a whole was indeed such that stocks of wheat in the four main exporting countries, the United States, Canada, Australia and Argentina were raised by 2-8 million metric tons to 17-4 million during the 12 months ended June 1949. Shipments of wheat and rye to deficit areas in South America, Asia, Africa and Oceania were increased by 2-0 million metric tons to 8-1 million as against only 3-0 million during the late 1930s. The greatly improved supplies of coarse grains in North America were used largely for livestock feeding there; but stocks were raised by some 24 million metric tons to about 41 million and exports by 3-0 million

to 5-2 million. In the international market this increase of North American exports was largely offset by a decrease of Argentine exports by 1-8 million metric tons to 2-2 million; but it was possible to sustain total European imports of coarse grains at 6-7 million. The whole increase of some 7 million metric tons in Europe's own production of coarse grains was thus available to raise livestock production further.

**Livestock Production in Europe.** Europe had good supplies of fodder and favourable grazing conditions during the autumn and early winter of 1948 and during the spring of 1949.

Egg, pigment and milk production responded rapidly to these better supplies of feedingstuffs. Estimates prepared by the Food and Agriculture organization (F.A.O.) of United Nations indicated that in Denmark, the Netherlands, Sweden, Eire and Belgium, considered as a group, egg production was 43% greater during 1949 than during 1948. Comparable percentage increases were 16% for the United Kingdom, 5% for France and Italy and 24% for Czechoslovakia. Egg production during 1949 thus exceeded prewar production by some 8% in the main prewar exporting countries and Belgium, but remained below prewar production by 2% in the United Kingdom, by 6% in France and Italy and by 29% in Czechoslovakia.

An expansion of pig production was also made possible. In Denmark the number of bred sows was increased by 102,000 (74%) between July 1948 and July 1949, one of the most rapid increases ever recorded. In the United Kingdom the comparable increase was 21,000 head (10%). In Eire total pig numbers increased by 45%, in Belgium by 41%, in France by 13%, in Poland by 28% and in Czechoslovakia by some 23%. These changes did not, however, restore production to the levels of the late 1930s. In Denmark, Sweden, Belgium and Switzerland these prewar levels came again within sight but in the United Kingdom, Eire and the Netherlands production was still at least some 30% lower during 1949 than during the late 1930s.

Increased supplies of feedingstuffs were also the main cause of the rapid increase in milk supplies. Sales of milk off farms in the United Kingdom were 14% and in Denmark 17% greater during the first half of 1949 than during the first half of 1948. Butter production in Eire, Denmark, the Netherlands and Sweden was 22% greater.

Improved production in Europe of eggs, pigment and dairy produce largely to increase domestic food rations or to reduce reliance on imports from the western hemisphere but the conditions most dependent on exports of such products continued closely to restrict domestic consumption. Thus Denmark and the Netherlands exported during the first half of 1949, as compared to the first half of 1948, 63% more eggs, 32% more butter and 158% more cheese. Their exports of bacon to the United Kingdom were up by 80%. There were also some significant exports from Poland and Yugoslavia.

Of beef and veal, mutton and lamb, the shortage of internationally traded supplies continued to be critical between January and June of 1949 but a slight improvement took place later and this, together with a temporary increase in the rate of slaughter in the United Kingdom due partly to a change in the seasonal variation of the official buying prices for fat cattle, caused a rapid building up of meat stocks. This necessitated release of substantial additional rationed supplies during October as there was insufficient cold storage accommodation. But the general underlying shortage of meat in the United Kingdom and Europe continued. Estimates published by F.A.O. showed that the production of meat during 1948 was less than in prewar years by 3-2 million metric tons (36%) in western Europe and by 1-3 million metric tons (41%) in eastern Europe. In the United Kingdom it was less by 0-34 million metric tons (34%) and imports into the United Kingdom were less by 0-30 million (30%). In North America, on the other hand, production was greater by 3-2 million metric tons (36%), in South America by 0-2 million (4%) and in Australia and New Zealand by 0-1 million (5%). Except in Australia and New Zealand these increases in supplies over prewar levels were mainly taken up by increased home consumption, exports being greater by only 100,000 metric tons from North America, by the same quantity from South America and by 70,000 metric tons from Australia and New Zealand.

**Northern Hemisphere Harvests.** In late summer of 1949 conditions became less favourable. Drought reduced grain yields in some European countries and shortage of pasture was marked in Switzerland, France and Italy. France suffered a reduction of cattle numbers because of the impending shortage of winter fodder. She had to plan to import 1-5 million metric tons of coarse grain during 1949-50, almost twice as much as during 1948-49. She also entered into special agreements for the purchase of butter and cheese from the Netherlands, Denmark and Switzerland. Even in England milk yields were substantially reduced. The seasonal decline was also accentuated in Canada.

On the other hand, autumn-sown grain crops generally did well and the European harvest of bread grain was satisfactory despite a reduction of acreages in favour of spring-sown coarse grains or a return to grass. In the United Kingdom total production of wheat was some 0 25 million metric tons less than in 1948. In France and Spain the reduction was proportionately greater, but in western continental European countries as a group the wheat and rye harvest was estimated to be 1 million metric tons greater than in 1948. Western Germany was expected to have some 0-2 million metric tons more bread grain and 0-45 million more coarse grains than from the 1948 harvest.

In North America wheat and rye production was some 5 million metric tons (11%) less than in 1948 but still sufficient to sustain large grain exports without calling heavily on existing swollen stocks.

Coarse grain crops in western Europe were, in most countries, not very much smaller than in 1948. In the United Kingdom the total production was estimated as almost equal to that of 1948. In North America production was down by some 12 million metric tons (9%) from the record levels of 1948, and Canadian production was down by some 15%. But with large stocks in the United States, total supplies of feed grain were the largest ever in relation to the livestock population to be fed. Maintenance or even increase of exports during 1949-50 became feasible.

Supplies of roughage feedingstuffs were unusually low in France and other European countries affected by the summer drought, and also in Canada. An unusually mild October made good only a small part of this shortage. In the United

Kingdom fodder roots and green fodder crops were unsatisfactory, being affected, like potatoes, sugar beet and vegetables, by the long drought.

*Agricultural Production Programmes.* All European governments continued to be concerned with agricultural plans and these were kept under general review by the Organization for European Economic Co-operation, by the Economic Co-operative administration of the United States and by other bodies. Increased bread grain production and increased production of coarse grains and other animal feedingstuffs to permit greater milk, meat and fat production continued to be the main objectives. The underlying purpose in each country was to improve the national diet and to minimize dollar expenditure for imports.

Plans were upset by weather conditions during the period June to Sept. 1949 but basic progress continued to be made in providing the fertilizers, machinery and motive power needed for greater production. Imports of agricultural tractors into continental Europe had numbered 54,000 during 1948 as against only 14,000 during 1937 and, in addition, increasing numbers were available from continental factories themselves. Supplies of agricultural machinery were also greater. The number of farm horses in Europe was estimated to have increased by 300,000 (2%) but was still 16% below the prewar number. One of the most satisfactory improvements was in the supply of nitrogen fertilizers.

In several countries considerable public attention was drawn to the difficulties of inducing farmers to carry out the centrally devised plans. In the United Kingdom a shortage

**Source:** E.A.O. Report of Committee on World Commodity Problems.
slight increase in that sown to coarse grains and maintenance of the linseed acreage. The fixed prices paid to farmers for fat cattle were raised some 37%. This plan, however, would still leave Argentine production far below prewar levels. The effects of industrialization and inflation accompanied by control of farmers’ returns, had reduced the number of agricultural workers by some 400,000 (20%) after 1937, and the area sown to cereals and linseed by some 1.4 million acres (30%). Even during the later part of 1949, the prices paid to farmers continued to be at a much lower level than prices charged to foreign buyers of farm produce. Large quantities of maize did not find export buyers at the prices sought and had to be sold as insect damaged at very low prices to Argentine livestock producers.

In Australia and New Zealand emphasis on expansion of production continued and some encouragement was obtained from higher prices for dairy products and meat sold to the United Kingdom. For New Zealand the bulk contract prices were raised by 7.5% and the Dairy Products Marketing commission raised butter fat prices to farmers by slightly over 5%. The butter fat in dairy products delivered from New Zealand factories during the year ended July 1949 was 461 million lb., 10% more than during 1947-48 and only 1% below the record output of 1940-41. Lamb production for export was also satisfactory but there were significant reductions in beef and pigmeat outputs. In Australia total meat production was higher but exports were slightly reduced because home consumption of beef rose by 9%. The sowing of wheat was hindered by dry spells, particularly in western Australia.

South African plans were wholly upset by the droughts which seriously reduced the working capacity of draught cattle and caused heavy slaughters.

In India a major event of 1949 was the government’s announcement in April that except in case of widespread failure of crops or for purposes of building up a central reserve no food grains would be imported after 1951. A central development board was given responsibility for securing an additional 3.6 million metric tons of grain from Indian lands through irrigation and reclamation schemes, clearance of scrub, subsidies for water supplies, manures and seeds and in other ways. An increase in the use of nitrogen fertilizers by more than three million metric tons was contemplated and some compulsion imposed on municipalities to make full use of their sewage and refuse.

Fears of Surpluses. These Indian plans for self-sufficiency in grains and the continuing drive in the United Kingdom and other western European countries for greater production and reduced imports from the dollar areas aggravated fears of food surpluses in the western hemisphere and until about mid-summer these were further aggravated in the United States by declining business activity and diminishing domestic demands. The council of the F.A.O. appointed a committee of experts in June to examine what seemed to be the familiar prewar problem of surpluses in some countries and starvation in others and this committee reported promptly that the causes of surpluses lay mainly in shortages of western hemisphere currencies. They proposed an international commodity clearing house with a capital of United States $5,000 million. This would be used, for instance, to buy United States wheat for India, the fund being repaid by India in rupees which would be held by the clearing house until they became convertible into United States dollars. Until there was fundamentally better balance in world trade it was foreseen, however, that this initial capital might comparatively soon be held in currencies still inconvertible into dollars.

The danger of surpluses, that is, of supplies forcing prices down below levels considered reasonably remunerative by producers, was expected particularly for sugar, cotton, certain fats and oils and, in some years, bread and feed grains. Some serious surpluses, especially of rubber and jute, were feared even in non-dollar areas.

General Price Changes. The main fears of farmers were that the general level of effective demand for their produce would decline. In some European countries a slackening of inflation of foodstuff prices was evident, especially during the early part of 1949. In the Netherlands, for example, where close attention was paid to changes in costs of farm production prices of livestock produce were reduced as a result of greater supplies of feeding stuffs and improvement of livestock yields, but generally farm incomes were well sustained.

In the United Kingdom agricultural prices were raised by an average of 7% following the February price review. This rise was due to withdrawal of part of the subsidy on feeding-stuffs, to increase of agricultural wages by some 4% and, not least, to the desire to expand agricultural production further in accordance with the programme first announced in Aug. 1947. Agricultural prices were, indeed, raised to the highest level ever recorded. After devaluation of the pound sterling these prices were not far out of line with price levels in the United States and Canada but they continued high as compared to the prices paid for the principal foodstuffs from Australia, New Zealand and nearly all European countries. Subsidies were continued in the United Kingdom on purchased fertilizers and on labour and machinery services administered by the County Administrative committees, but it was announced in July that half the fertilizer subsidy would be withdrawn in July 1950 and the remainder in July 1951. Complete withdrawal of the remainder of the feedingstuffs subsidy in April 1950 was announced in October. A reduction of subsidized machinery and labour services was also contemplated.

Trade Agreements. Freer multilateral trade continued to be the ultimate objective of the United Kingdom government and others receiving financial aid from the United States; and controls of trade were relaxed for some fruit and vegetables and minor agricultural products. Competition from Belgian, Dutch and other continental countries was much

The drought in Great Britain in 1949 caused many farmers to improvise water supplies. Here in Lincolnshire a tractor has been connected to a pump to provide sufficient water for a small herd of cattle.

...feared by British growers; a conference of the International Federation of Agricultural Producers was called to discuss control of trade in horticultural produce but no agreed proposals were reached. Increasing supplies of eggs from Eire and the continent caused anxiety to British farmers and this was aggravated by the fact that the official price paid for eggs was not raised in April by as much as would cover increases of feedingstuffs and other costs. Farmers did not, however, object to the comprehensive bilateral trade agreement reached between the United Kingdom and the Argentine because meat continued to be in such obviously short supply and because many farmers were anxious to secure more coarse grains for animal feeding. A new six year agreement between the United Kingdom and Denmark for butter was negotiated in June 1949 by which the price for the year Oct. 1949-Sept. 1950 was 15½% lower than the price during Oct. 1948-Sept. 1949; yearly reductions or increases of 7½% could also be negotiated each autumn during the course of the agreement.

An international wheat agreement was negotiated during the early months of 1949 and ratified by the four main exporting countries and by a sufficient number of importing countries before August.

Some Tropical and Sub-tropical Developments. World production of rice continued to increase but serious setbacks were suffered in Burma. Many villages were burnt in Burmese-Karen warfare. The administrative machinery for granting loans to rice cultivators was largely disrupted and the planted rice area declined further by some 20% to 8 million ac. as compared to 12½ million ac. prewar.

Cane sugar production in 1948-49 was raised by a further 3% to a total of 18% greater than that of the late 1930s. Beet sugar production was also greater than in prewar years by 3%. The free market for sugar exports continued to be much restricted as a result of dollar shortages and it was feared that serious surpluses would be evident before long in some exporting countries.

Fats and oils continued in short supply on international markets. During 1948 world production had been only some 7% less than in prewar years but exports had been less by 30% since the producing countries had been consuming more.

During 1949 there was no substantial general improvement in this position. Some further progress was made by the United Kingdom's Overseas Food corporation in establishing new farming areas in Tanganyika but the 1949 crop was ruined by drought and costs were exceptionally high. Better progress was made in speeding transport of stocks of groundnuts from long established farming areas in northern Nigeria.

Agricultural Research and Technical Developments. Research on many fronts continued in almost all countries and there was a growing faith in the ability of science eventually to overcome the danger to mankind from malnutrition and starvation. This was memorably expressed by Sir John Russell (q.v.) in his presidential address in Sept. 1949 to the British Association for the Advancement of Science.

Amongst the more noteworthy lines of research were those in plant physiology, making use of radio-active tracer elements, and those concerned with organic weed-killers and pesticides of many kinds. A considerable advance was made towards control of trypanosomes in tropical cattle. Remarkable increases of crop yields were secured in trials of phosphate fertilizers in pill form on some Nigerian soils.

Notable progress was made in the designing of harvesting machinery and of labour saving arrangements for dairy farms in the United Kingdom. Despite exceptional weather conditions some sound progress was also made in the United Kingdom in devising economical methods of grass conservation.

(J. R. RA.)

</table>

The 1949 wheat crop, though the fourth largest on record, was a disappointment. A record acreage was sown and survived the early stages nicely, only to be rather severely damaged just prior to harvest in the Southern and Central Plains by excessive rain and fungus diseases. Nevertheless, the total supply situation was such that acreage allocations were set for the 1950 crop at about 15% less than in 1949. Domestic consumption of the large crop would not be much more than 700 million bu. Exports, which in 1948-49 reached the unprecedented level of 503 million bu., were expected to be less than 400 million bu. Thus the carryover at the end of the crop year, July 1, 1950, would be 350 million bu. The preliminary survey of the winter wheat crop for 1950 suggested that sown acreage had been reduced as requested but that the crop was in excellent condition and might produce nearly as much as in 1949.

The cotton crop of 16,034,000 bales was the largest since 1937 and the sixth largest on record. The Brazilian crop was expected to be smaller than in 1948.

A crop of 401,962,000 bu. of white or Irish potatoes was produced, compared with 454,654,000 bu. in 1948, even though the harvested acreage was the smallest since 1878 and less than the official target. Nevertheless, an estimated $50 million to $60 million support programme was under way with prices being supported at 60% of parity against 90%, in 1948. The average yield of 211.4 bu. per ac. was not much below the record 215.5 bu. of 1948, and far above the 145.5 bu. ten-year average. Maine had a record yield of 450 bu. per ac.

**Livestock Production** The amount of livestock increased in 1949. The reasons differed for each type of animal, but the record abundance of feedstuffs was recognized as a principal factor. The expansion in livestock and its products during 1949 was sufficient to counterbalance the moderate decline in overall crop production, giving a total agricultural production volume for 1949 equal to the record 1948 production.

All cattle at the beginning of the year totalled 78,945,000 head, compared with 78,126,000 head a year earlier, but approximately 10 million head more than before World War II. Of that total, 24,450,000 head were milk cows, as against 25,039,000 a year before. The slaughter of about the same number of cattle for beef at slightly heavier weights than in 1948 provided an estimated 10,880 million lb. of beef and veal, compared with 10,600 million lb. in 1948. A new record for prize fat steers was set up when the grand champion at the Chicago International was auctioned for $11,50 per lb.

There were 57,139,000 head of pigs on U.S. farms at the beginning of the year, an increase from 55,028,000 head in 1948. The major spring pig crop was 59,039,000 head, well above the 51,266,000 head of a year earlier, and the autumn pig crop was estimated at 37,262,000 head, compared with 33,921,000 head a year before. During 1949 10,650 million lb. of pork was produced as against 10,246 million lb. in the previous year. At the end of the year it was estimated that pork production in 1950 might approximate 11,500 million lb., a result of the increased autumn pig crop of 1949 plus an estimated increase to 62.5 million head in the spring crop.
of 1950. In great contrast with the record high price of $31.85 per cwt on the Chicago market in Aug. 1948, average pig prices in 1949 remained below $20 per cwt. and in December declined to the lowest price for the year at $14.80 per cwt.

Sheep on U.S. farms at the beginning of the year, 31,963,000 head, were the smallest recorded number, having declined from 34,827,000 head the previous year and more than 50 million head prerewar. Consequently, the 1949 lamb crop was a very small one of 18,906,000 head and provided only 600 million lb. of lamb and mutton in 1949, as against 753 million lb. the previous year.

The 24,450,000 milch cows on U.S. farms at the beginning of 1949 represented a decline from the 25,039,000 head in 1948, but it was estimated that the end of 1949 would show an increase. A result of the very heavy feeding of the smaller number of cows from the abundant harvests of 1948 and the fine pastures of 1949 was that milk production per cow reached record levels, and total production for the year was about 118,000,000,000 lb., 2%, more than in 1948, with still larger production expected in 1950. Prices of most dairy products declined in 1949, sharply at wholesale, very moderately at retail, and the government continued to accumulate butter and dry milk powder in large amounts in its price subsidy operations.

There was a large poultry population during 1949, hens on farms at the beginning of the year numbering 448,838,000, compared with 461,550,000 head a year before. Chickens raised in 1949, excluding commercial broilers, were 749 million head, as compared with 637 million head the previous year. Broiler production continued at a high level.

The steady decrease in the number of horses continued—there were 5,921,000 head on farms in 1949 as against 6,589,000 head in 1948. Mules were 2,353,000 head, as against 2,541,000 head the previous year.

Food Stocks and Exports. Food stocks continued to increase in 1949 in the major exporting countries. Exports reached very high levels during the early part of the year but appeared to slacken in the latter part. On July 1, grain stocks in the four principal exporting countries were at 72.8 million short tons, 35%, larger than the average for five previous years. Of that total about 52 million tons were in the U.S., Argentina held 15% of the total, Canada 9%, and Australia 4%.

Food exports by the U.S. in 1948-49, mostly to countries with the Economic Co-operation administration or to occupied areas, amounted to about 49,521 million lb. Wheat made up more than three-fifths of the total; other grains accounted for about one-fifth.

Farm Prices. Farm prices continued to decline in 1949. In December, the index of prices received for all farm products stood at 236 (1909-14 = 100), as compared with 268 a year earlier. Even the maintenance of that level was largely due to government subsidy programmes; although some prices were below subsidized prices, the official programme appeared to have much weight in preventing some farm prices from falling.

Farm Income. Late in the year it was estimated that the total gross farm income for 1949 would be about $32,000 million, about 10% less than in 1948. This gross income included not only cash income from marketings, but government payments, value of home consumption, rental value of dwellings and the expenses of agricultural production. Total farm production expenses amounted to about $18,000 million, only 3% less than the $18,600 million of the previous year. Realized net income was estimated at $14,000 million, compared with $16,700 million in 1948. Cash receipts from marketings in 1949 were estimated at about $27,700 million or 9% below receipts in 1948. Although both crops and livestock were marketed in a slightly larger volume than in 1948, total crop receipts were estimated at $12,300 million, that is, a 7% decrease from the 1948 level, and livestock and its products at $15,200 million, down 11% from 1948. Nevertheless, the income, credit and debt structure of U.S. agriculture continued to appear favourable.

Farm Land Values. Farm real estate in the U.S. declined in value by about 6% in the year ending Nov. 1949, as compared with price values a year earlier. The decline was irregular, amounting to 10% to 14% in some mountain and western states, whereas a few midwestern states recorded an increase. The amount of funds available for farm mortgage financing decreased as farm prices declined.

Farm Population. According to a preliminary estimate at the beginning of 1949, the farming population of 27,776,000 constituted about 19% of the U.S. total of nearly 150 million; the agricultural group increased compared with 1948, when it was 27,440,000 persons.

Farm Labour. At the end of 1949 7,150,000 persons were employed on farms, almost the same number as a year before, but below the peak employment for the busier part of the agricultural year when slightly more than 12 million persons were employed, of whom more than three-quarters were family workers. Not only was the number of persons employed in agriculture in 1949 about 3% less than during the previous year but farm labour was slightly less expensive in 1949 than in recent years.

Farm Machinery. The farm machinery supply situation improved in relation to demand, although prices were the highest on record. The mechanization of U.S. agriculture continued at an unparalleled rate. The number of tractors on farms at the beginning of the year was 3.5 million, 281% of the prewar level and 350,000 more than a year earlier, although the cost of using tractor power was higher than in any previous year. Used machinery declined in price. Exports of farm machinery were higher in early 1949 than before.
A modern tractor-driven spray which was demonstrated in 1949 for use against tree pests.

Commodity Credit Corporation. This very important financing organization of the Department of Agriculture carried on three major programmes during the year 1948-49: price support, supply and foreign purchase. During the year it received additional legislative authority to expand its grain storage activities and did so, particularly with reference to corn, contracting for more than 250 million bu. of new storage space, most of which was used for storing corn taken over by the government under subsidy operations for the 1948 crop.

Under farm subsidizing operations, the Commodity Credit corporation at the end of October had $3,148,577,435 (of its authorized $4,750 million borrowing authority) invested in farm commodities. It held at that time an inventory of $1,692,478,677 worth taken over under price support and was additionally committed under loan and purchase agreements to the possible extent of $1,456,098,758.

Commodity Trading. Activity in commodity markets declined in 1948-49, particularly with regard to wheat and cotton. The Commodity Exchange authority continued to request legislation to extend its supervision to future trading in 11 commodities not already covered, for authority to fix minimum margin requirements on speculative transactions and the registration of commodity trading advisory services.

Agricultural Legislation. The Brannan Proposal (by Charles Brannan, secretary of agriculture) of April 1949 did not become law but it was the most discussed farm legislative proposal of the year. The major farm organizations and agricultural leaders, in and out of office, disagreed as to its merits. It was a price subsidy plan based on an income objective. A farm income standard was to be set as a minimum goal under which farm purchasing power would be maintained at least at the same level as the average for the first 10 of the most recent 12 years. For 1950 this would require an income of $26,200 million, about 15% less than the $31,000 million of 1948. This minimum was to be used only as the starting point for computing commodity price subsidies.

Definite price subsidies were to be assured on corn, cotton, wheat, tobacco, milk, eggs, chickens and the meat-producing animals. They accounted for about 70% of cash farm receipts. Other commodities were to be supported within the limits of available funds.

Two major methods of support were to be used. On storable commodities, loan and purchase agreements were to be continued. On perishable commodities the entire produc-
The basic aircraft industry at the end of 1949 consisted of 34 manufacturers of complete aircraft, with 39 plants, and 13 manufacturers of aircraft engines, operating 14 plants. The balance of the industry consisted of a large number of propeller and accessory companies backed up by suppliers of parts and materials as well as subcontractors and manufacturers of sub-assemblies. The latter categories were of increasing importance. In the production of the Boeing B-47 bomber for example, 48% of the total cost went to hundreds of subcontractors, and in the manufacture of the General Electric J-47 turbo-jet engine it was estimated that 280 subcontracting companies participated.

The 3,400 output of private planes was a great disappointment to those who before the end of the war predicted a probable production of 50,000-60,000 a year by 1950. The market failed to develop because the private aeroplane was not developed to the point of real usefulness at low cost. At the end of 1949 there was nothing in sight that would change this situation and greatly increase the demand.

The demand for commercial transport aircraft had been dropping off steadily as the civil air lines in the U.S. completed their modernization programmes. At the end of 1949 there were approximately 1,100 transport aircraft in service on U.S. domestic and overseas air lines, which appeared to be about the number that the traffic could bear in the immediate future. Some replacements would be required during the next few years, but it was probable that the demands for the next year or two would fall below the 1949 level.

A number of U.S. jet transport designs were being planned. Several years must elapse, however, before interest would be reflected in actual orders for jet transports. Few U.S. air lines could afford to replace existing equipment with jet-powered equipment much before 1955.

In addition to the conventional aircraft types mentioned above, helicopters were a factor in 1949 U.S. aircraft production. A number of new companies had come into the field but over-all production statistics were incomplete. It was estimated, however, that about 200 helicopters were produced in the United States during 1949. Most of them went to the military services for special uses (air-sea rescue work, etc.) but a few went into commercial use for the carriage of mail and small items in isolated districts. (See also Jet Propulsion and Gas Turbines.)

The outstanding development of the year was the formal ratification through the North Atlantic treaty (q.v.) of the policy through which Great Britain was already furnishing jet fighters and engines to nations of the Western Union and their democratic neighbours, under the Treaty of Brussels of 1948. Nations who signed the Atlantic treaty, or were in sympathy with its purposes, had already begun to equip their air forces with British Vampire and Meteor fighters. British jet engines were also available to them. France purchased British fighters and was beginning to manufacture British jet engines under licence. Belgium purchased Meteors and Meteor trainers, and the Rolls-Royce Derwent turbo-jets for these were being built at Liege under licence. About 20 Meteors were purchased by the Netherlands where the Meteor trainer was also in use. Netherlands naval aviation was using the British Hawker Sea Fury, and the Fairchild Firefly among its piston-engined aircraft. Switzerland purchased 75 Vampires and was licensed to build 100 more, with Goblin engines to be sent from Great Britain. Both Norway and Sweden purchased Vampires; and Sweden was manufacturing the de Havilland and Goblin turbo-jet under licence. Italy ordered 50 Vampires in 1949, to be delivered by March 1950.
The formalizing of the Western Union defence plan included the establishment of a central supply and resources board under the Western Union defence committee. The excellence and availability of British jet fighters and jet engines, together with the fact that they were already being purchased, made their use in western Europe natural. At the same time the western hemisphere would tend to use U.S. equipment.

The U.S. was responsible under the North Atlantic treaty for long range strategic bombing requirements, on the basis of existing equipment. British Lancasters and Lincolns, and the coastal-defence Shackletons, were limited in range, though Britain's position in this respect would be improved by the acquisition of American B-29s. The existing plan called for short range attack bombing and fighter defence by Britain, France and the other allied nations. This was being pursued at the end of 1949 to such an extent that the allied nations were receiving fighters from Britain while R.A.F. reserves and overseas units were still using a great deal of wartime reciprocating engine-powered equipment.

**Great Britain.** The first British jet-propelled bomber, the English Electric A 1 Canberra, was first flown in May 1949. It was powered by two Rolls-Royce Avon turbo-jets mounted in nacelles in the wings. The conventional Avro Shackleton, powered by four Rolls-Royce Griffins with counter-rotating propellers, continued to be the only British bomber developed since the war in the 100,000 lb. class. The Avro 707, a Delta-wing research fighter powered by one Rolls-Royce Derwent, was said to be part of a research programme leading toward a Delta-wing bomber using twin turbo-jets contained in the wing. Handley Page was reported to be working on a jet bomber of unconventional design, and the de Havilland company on a jet bomber which might be based upon its successful civil turbo-jet transport, the Comet.

The Vickers Supermarine 510 was one of the experimental fighter types to appear during the year. It was estimated to have flown at about 660 m.p.h. at Farnborough, in September, and to handle well at high altitudes. A Rolls-Royce Nene turbo-jet was the power plant. The experimental Hawker P.1052 was also powered by a Rolls-Royce Nene. The manufacturers claimed an unusually long range for it. The de Havilland Venom F.B.1, first flown on Sept. 2, was powered by a de Havilland Ghost turbo-jet. Its manoeuvrability at altitude, climb and speed were favourably reported and the Venom was known to be an all-round improvement on the Vampire. The Royal Navy's Westland Wyvern torpedo fighter appeared at Farnborough as the first front line military aircraft to be powered by a turbo-prop.

While Vampires and Meteors were the standard fighters of the R.A.F., the de Havilland Hornet and Mosquito, the Hawker Tempest, the Supermarine Spitfire and the Bristol Brigand continued among the piston-engined aircraft in service for various duties as long-range fighters, night fighters,ighter bombers and light bombers.

In addition to the jet-propelled de Havilland Sea Vampire and Supermarine Attacker, the navy continued with the de Havilland Sea Hornet, Hawker Sea Fury, Supermarine Seafire, Blackburn Firebrand and Fairey Barracuda and Firefly for carrier-based fighting, night fighting, fighter-reconnaissance and bomber aircraft duties. Two new R.A.F. anti-submarine aircraft were announced late in 1949, the Blackburn Y.A 5 and the Fairey 17.

British gas-turbine development continued intensively during 1949, with definite trends towards increased use of axial-flow designs and higher power in both turbo-jets and turbo-props, and renewed interest in after-burning as a source of additional power. The first British rocket motor made its appearance in 1949, the de Havilland Sprite, giving a thrust of 5,000 lb. for 9 sec. The Sprite was intended for use in the assisted take-off of such aircraft as the de Havilland Comet. Among the new turbo-jets were the Rolls-Royce Avon, the Rolls-Royce Tay turbo-jet, the Armstrong Siddeley Double Mamba (consisting of two Mamba 3s driving a single shaft) and the Napier Double Naiad which was reported under development. Both the Mamba and the Naiad were axial-flow turbo-props. The Bristol Proteus turbo-prop, which was expected to be flown in 1950, was to power the Bristol Brabazon II and the Saunders-Roe Princess, the giant transports. The Armstrong Siddeley Sapphire, latest of the turbo-jets, was reported to be a development of the Metropolitan-Vickers Beryl.

The R.A.F. was using or had ordered principally the Handley Page Hastings (75,000 lb.) as a heavy transport, the Bristol 170 (40,000 lb.) and the lighter Percival Prince and Vickers Valetta during 1949. The civil jet-transport programme proceeded intensively and the possibilities of jet transports in military use and in bomber development were mentioned by observers. The 130-ton Brabazon I was first flown in September; and construction on the Brabazon II and the giant Saunders-Roe Princess flying boat was proceeding. These would be powered by the Bristol Proteus turbo-prop. The first flights of the de Havilland Comet, powered by four Ghost turbo-jets, were successful; and this plane was expected by British and several U.S. observers to have an excellent future. Among the turbo-prop civil aircraft to fly first in 1949 were the Handley Page Hermes, heaviest turbo-prop transport at 84,000 lb., and the Handley Page Miles Marathon, at 18,000 lb. Both the Vickers Viscount and the Armstrong-Whitworth Apollo underwent considerable flight testing in 1949.

The Westland-Sikorsky S-51 was the only helicopter reported in quantity production for military purposes, a number having been ordered by the Royal Navy.

The **Commonwealth.** Reflecting the strong research and development programme on military aircraft and gas turbines in Great Britain, Canada and Australia were working on independent designs which might affect the future equipment of their air forces.

In Canada, the Avro Orenda turbo-jet completed more than 750 hr. of ground tests, and was being test flown in a North American F-86A fighter. The CF-100 (formerly the XC-100) was expected to make its first flight early in 1950. The outstanding transport development in Canada was the Avro C-102, powered by four Rolls-Royce Derwent turbo-jets. This aircraft was flown at 500 m.p.h. above 30,000 ft. In Australia, a twin-jet all weather fighter was reported under development, probably to be powered by Rolls-Royce Tay turbo-jets. Commonwealth Aircraft corporation was licensed in September to produce the Canberra bomber and the Hawker P.1040 fighter. The Rolls-Royce Nene was being manufactured under license in Australia; and the de Havilland company in Australia was manufacturing the Vampire, the standard fighter of the R.A.A.F. (M. H. Sm.; S. P. J.) United States. Operation "Vittles," until the lifting of the rail blockade of Berlin on May 12 by the Russians, was a major U.S. air force activity during 1949. The Berlin air lift had begun operations on June 26, 1948, by flying, in a 24-hr. period, 80 tons of food and other needed supplies into Berlin. The planes during the first days of the project were two-engined C-47s. The amount of supplies flown by air was greatly increased by the addition of four-engined C-54 transports and by May 12, 1949, a total of 195,998 flights had been made by U.S. and British transports, carrying 1,589,567 cargo and passenger tons. With the announcement of the lifting of the rail and road blockade, the combined air lift was gradually inactivated as part of a plan to reduce the scope of operations. This phasing out continued until Sept. 30, the closing day of the Berlin air lift. During its 15 months of operation, U.S. planes had massed a total of 591,347 flying
bombers by flying from Moses Lake, Washington, to Andrews field, Camp Springs, Maryland, on Feb. 8, 1949, in 3 hr. 46 min. The 125,000 lb. bomber, accepted by the air force late in 1948, utilized a new type of landing gear with wheels mounted in tandem or bicycle fashion.

Four new jet fighter planes were among the new aircraft to be test flown during the year. One of these, the XF-92A, formerly designated the Model 702 research plane, was a radically designed fighter using the Delta wing for the first time. Experimentation and evaluation of the aerodynamic characteristics of the Delta wing, which has a sweepback of 60°, had previously been conducted in wind tunnel tests. The Republic XF-91 interceptor, and the Lockheed XF-90 penetration fighter, made initial flights at Muroc air force base, California. Flight evaluation of the XF-94, a radar-equipped advanced design of the Lockheed TF-80, was also made.

Two trainer aircraft were test flown in September. The North American T-28, single-engined, low-wing monoplane, was designed to replace the T-6 Texan, which was used widely in training pilots during World War II. The T-28 included several improvements over its predecessor. The T-29, modification of the Convair Model 240 transport, was designed to train student navigators. This flying classroom had 14 stations, each equipped with a Loran scope, radio compass, altimeter, air-speed indicator, drift meter and map table.

Other new aircraft included the XC-123, a twin-engined assault transport, and an experimental bomber, the Martin XB-51. Powered by three turbo-jet engines, the XB-51 was the first postwar aeroplane specifically designed for the destruction of surface targets in co-operation with ground forces. The XB-52, which was under development, was a jet long range heavy bomber.

The total number of officers, and airmen on duty in the U.S.A.F. reached 419,919 as at Aug. 31, 1949. This total represented full time military personnel, regulars and reserves, on active duty.

As at July 1949 there were 9,400 U.S.A.F. planes in active status including postwar types. Included in this total were combat and utility aircraft. Combat aircraft included bombers, fighters, reconnaissance, combat amphibian and search and rescue planes performing the mission for which they were designed. Utility aircraft included transport, trainer and communications aircraft and former combat aircraft.

A new distinctive blue uniform, identical for officers and airmen except for insignia of rank, was approved by the air force at the beginning of the year. All airmen were to be equipped with new uniforms by Sept. 1, 1950.

The headquarters of four numbered air forces (the 1st, 10th, 14th and 15th) and several tactical units in the United States were re-located and six tactical groups were scheduled to be inactivated in accordance with a programme of economies announced in August by the Department of Defence. Under this plan, nine bases were declared surplus to the needs of the U.S.A.F.; and disposal, under the provisions of public law 152, 81st congress, was initiated. The group structure of the air force was reduced from 54 to 48. In Oct. 1949, the congress passed legislation authorizing a group structure of 58.

U.S. Navy. Reduction of the aeronautic organization of the U.S. navy to the level permitted by the budget for fiscal 1950 began early in 1949. By July, the number of operating and support aircraft was lowered to 10,500, aviation officers to 12,205 and enlisted rates to 63,490. By the same month, 3 battle, 5 attack, 3 light and 3 escort carriers and 14 aircraft tenders were operating with the fleet; active aviation shore stations numbered 60; overseas bases, 13. Several Pacific bases were closed and some Atlantic bases used in World War II were re-activated.
Flight training was concentrated at Pensacola, Florida, and Corpus Christi, Texas, and technical training at Memphis, Tennessee. The F8F fighter, AD attack plane and PV patrol plane were introduced in flight courses and jet fighters were introduced in operational training. The organized reserve was expanded to 7,800 officers and 21,500 men. Training was conducted on a year-round basis and 15 air groups completed two-week cruises aboard carriers.

On March 4, the "Caroline Mars," one of four large seaplanes operating with fleet logistic support wings, Pacific, broke a record by carrying 263 passengers in addition to her crew of 6, from San Diego to Alameda, California. The same month, a P2V-3C patrol plane with a 10,000 lb. bomb load, took off from the carrier "Coral Sea" in the Atlantic, flew across the United States to drop its bomb load, and returned nonstop to Patuxent River, Maryland, after a flight of more than 4,000 mi.

In support of the Berlin air lift U.S. navy squadrons VR-6 and 8 participated in the air lift from Nov. 1948 to June 1949. VR-8 not only carried the most tons in any month, but with VR-6 a close second, led all air force and navy squadrons in the efficient use of aircraft over the entire period.

The former seaplane tender "Norton Sound," placed in operation early in the year as a test ship, aided in solving many launching and directing problems in the field of guided missiles. Wind tunnel facilities and equipment were improved. Research in turbo-jet engines increased performance. The jet fighters F2H Banshee, F9F Panther, and F6U Pirate, and conventional attack planes AD-3 Skyraider and AM-1 Mauler, which was capable of carrying a heavier bomb load than any known single engine plane, were operating with the fleet. Helicopters had replaced single-engined seaplanes on battleships and cruisers. Work was begun on the modernization of three carriers and installation of more powerful deck gear for the operation of larger aircraft.

(C. T. D.)

U.S.S.R. The main sources of information regarding aeronautical progress in the U.S.S.R. were reports of observers of Soviet aircraft on the traditional May day and Aviation day displays, the latter of which was in July 1949. No close-up inspection of aircraft was allowed. Visitors had to be content with what they could see as the machines flew overhead. Because of the variety of types that had been observed on such occasions there was no question but that the Russians were exploiting their knowledge of jet aircraft and jet engines to the limit. In this they were unquestionably aided by large numbers of Germans who had been picked up in the Soviet zone of Germany and had been at work for the Soviet government during the past five years.

It was known that the Russians had been heavily occupied with the development of the guided-missiles projects based on German wartime research. This lent weight to speculation that development of liquid fuel rocket engines on a considerable scale was under way, both for piloted aircraft and for guided missiles. The Russians claimed to have flown an experimental jet-powered aeroplane at speeds greater than the speed of sound. There was, however, no proof of this accomplishment.

In the bomber categories, only two new types were definitely identified, the Ilyushin four-jet bomber and the Tupolev twin-jet attack bomber. They appeared to be in the medium bomber category. The best guess was that the range of the Ilyushin four-jet bomber was approximately 1,500 mi. with a bomb load of about 5,000 lb. It was thought that the Tupolev twin-jet bomber might be capable of carrying a 5,000 lb. bomb load somewhat less than 1,000 mi., and that it had a speed of at least 445 m.p.h.

In the jet-fighter category the work of only three designers had been definitely identified, Lavochkin, Mikoyan and Gurevich (MIG), and Yakovlev. Lavochkin had a long background of design of successful single-seat fighters of conventional types. As early as 1947, an LAV-9 fitted with auxiliary jet and rocket power plants was reported in the Aviation day display. Newer LAV jet designs had also been seen but details were entirely lacking. The MIG-9 twin-jet fighter by Mikoyan was a single-seat monoplane of conventional configuration. The engines were believed to be German axial-flow type turbines developing a thrust of approximately 3,500 lb. each. Its estimated speed was of the order of 600 m.p.h. Two Yakovlev jet fighters were described. The YAK-15 was apparently based on an earlier design (the YAK-3) in which the conventional reciprocating engine had been replaced by a Jumo-004H axial-flow turbo-jet engine mounted underneath the fuselage. Other dimensions and weights were lacking. The maximum speed was probably in the 500 m.p.h. range. The YAK-17 was a later development—resembling in general the Republic F-84 Thunderjet of the U.S. air force. The probability was that this machine was in the 600-650 m.p.h. class. It appeared to be the best of the 1949 U.S.S.R. fighter designs.

Reports continued of production of a Tupolev modification of the B-29 bomber. A transport modification, the TU-70, was also reported. This was a four-engined type designed for
72 passengers and a crew of 4 or 5. Ilushin also appeared to be in production on cargo and transport types.

The total number of aircraft in the Soviet military and civil air fleets was entirely unknown as was the 1949 rate of aircraft production. There was undoubtedly a very considerable aero-engine activity within the borders of the U.S.S.R. Designers appeared to be competent and they seemed to have access to up-to-date information from Soviet research laboratories and from those outside the U.S.S.R. The chances were good that a large well manned air fleet was in being, backed up by an industry of considerable capacity, but British and U.S. sources were in agreement that, at the close of 1949, the Western Union powers had a marked edge in technological development.

Europe. France. The French air force in 1949 was still equipped largely with surplus aircraft of World War II, except for a few British de Havilland Vampire jet fighters. Modernizing was discussed and reported upon, but action was slow. Purchases abroad were expected to provide most new types, such as jet fighters; but in the autumn there was another political crisis with changes in the defence ministry and a new plan was reported late in the year which would involve a considerable overhauling of the nationalized aircraft industry.

The outstanding French jet aircraft of 1949 was the Leduc O.10 ram-jet, which made its first powered flight on April 21. This plane had left the ground only on the back of a Langueauc 161 air liner, but it might be fitted with rockets for take-off power. The Leduc ram-jet engine propelled it at more than 450 m.p.h. at half power on its first powered flight. The Dessault MD 450 Ouragan fighter, powered by a Rolls-Royce Nene turbo-jet built by Hispano Suiza in France under licence, appeared to be the choice under the new plan as the standard French interceptor fighter. The S.N.C.A. (Société Nationale de Constructions Aéronautiques) du Sud-Ouest S.O. 6020 Nene-powered fighter would probably be built to the number of several hundred as all-weather fighters under the new plan. Experimental jets of the S.N.C.A. du Nord were the Nord 1600 and the Nord 2200. The latter was designed as a carrier-borne fighter. The Bréguet 960, under construction, was another naval fighter-bomber, with a Nene turbo-jet in the rear and a Mamba turbo-prop in the nose.

The jet engines used in military aircraft in France were British, either imported or manufactured under licence. French development of the gas turbine began in 1946. The S.N.E.C.M.A. (Société Études et de Construction de Moteurs d’Aviation) ATAR 101B turbo-jet, at 5,000 lb. thrust, and the TB 1000 turbo-prop of the same company, at 1,220 shaft h.p., were in bench test stages. The Compagnie Électro-Mécanique T.GAR 1008 turbo-jet, at 4,850 lb. thrust, and its TGA-1 bis turbo-prop, at 2,410 shaft h.p., were in the prototype testing stage. The Rateau SRA-101 turbo-jet, made by the S.N.E.C.M.A. company, developed 8,820 lb. thrust. New piston-engine development in France was almost at a standstill at the end of 1949 and the engine industry was considered to be in a stage of transition to emphasize gas turbines.

Italy. The Italian air force, by peace treaty provisions, was limited to 200 defensive fighter and reconnaissance aircraft and 150 trainers and transports. Front line aircraft in 1949 were surplus Supermarine Spitfires from Britain and Mustangs and Lockheed Lightnings from the U.S. The aircraft and engine industries in Italy made slow progress in recovering from war damage and were producing only a few light transports, light aircraft and military trainers at the end of 1949. Among Italian transports, the Breda-Zappata B.Z. 308 transport for 55 to 80 passengers, powered by four Bristol Centaurus engines, was still undergoing its flight tests in 1949. This was the most advanced transport being built in Italy. The Argentine government ordered 10 of these in late 1949.

The engine manufacturers were making light engines principally, but Alfa Romeo and Isotta-Fraschini continued to develop engines for transports and trainers. Isotta’s two new engines, the 8-cylinder air-cooled Cypelles at 400 h.p. and the 18-cylinder liquid-cooled Gypagus at about 1,600 h.p., the latter with its latest Delta at 800 h.p., indicated the state of Italian engine development at the end of 1949. Alfa Romeo was producing excellent engines in the medium and light class but little activity in jet propulsion was in evidence.

The industry was in so weak a state that both the Caproni and Cant companies were reported to have been closed down; but a new development late in the year placed the Fiat, Macchi, Ambrosini and Alfa Romeo companies in a new position. These firms formed a company to sign contracts with the British de Havilland company to manufacture Vampire fighters and Goblin turbo-jet engines. An order for 50 Vampires by the Italian government, to be delivered by March 1950, would furnish the air force with jet fighters until the Italian jet-building programme should get under way. (See also Aircraft Manufacture; Airports; Aviation, Civil; Jet Propulsion and Gas Turbines; Munitions of War.)

AIRPORTS. The International Civil Aviation organization (I.C.A.O.) in 1947 issued recommendations for standard and recommended practices as to airport size and capacity. These standards, although not binding on the member nations of I.C.A.O., proved a useful guide to those authorities planning new airports or extensions to existing ones.

Great Britain. By 1949, only one airport in Great Britain, London airport, fell into the first category (A.1); i.e., it had a main runway not less than 8,400 ft. in length, and could bear a single wheel load of at least 100,000 lb. at 120 lb. per sq. in.

The concreting of the six-runway layout at London airport
was almost completed; but only one triangle was serviceable and much additional work to the lighting, drainage and radio aids remained to be carried out before further runways could be used. Development of the central terminal area was begun and four further temporary hangars were completed during the year.

The air traffic control problem became more acute, particularly in the London area, where London and Northolt, both handling heavy density traffic, proved to be too close under instrument flying conditions. Additional points of entry and exit for the Metropolitan Control zone were provided, an inner zone was created and the holding area for airliners waiting to land at Northolt was moved to near Bovingdon, Hertfordshire. It was announced that all civil airlines now operating from Northolt would be re-based at London airport by the end of 1954.

Another development in the London area was the taking over of responsibility at Stansted, Essex, by the Ministry of Civil Aviation, which intended to develop it as a main diversion and charter flying base. Other British airports showed little change, except that at Manchester (Ringway) one runway was extended by over 1,000 ft. and a new terminal building opened; the stressing of the main runway at Prestwick, the Scottish transatlantic airport, for airliners of Stratocruiser weight was completed; and Glasgow (Renfrew) had its runways re-surfaced. Although not a civil airport, Bristol (Filton) was the scene of the Brabazon’s first flight, and the special runway and the assembly hall (largest structure of its kind in the world) also received B.O.A.C.’s fleets of Constellations and Stratocruisers for maintenance.

Belgium. At Brussels (Melsbroek) work was concentrated on building four double hangars to occupy 4,800 sq. yd. A start was made on developing Antwerp (Deurne) as an international air freight centre.

Finland. It was announced that the airport for Helsinki, Malmi, was to be replaced by a new one at Seutula, to be ready for the Olympic Games in 1952.

France. The airport construction work vote was cut by Fr. 85 million, but the planned development of Paris (Orly) for intercontinental traffic was continued. The basic layout was to be similar to that of London airport; but two of the three runways in use by the end of 1949 were parallel.

Germany. The Anglo-U.S. airlift of 1948-49 reached such proportions that the three receiving airports in Berlin dealt with the heaviest density of aircraft movements in the history of aviation. At the British-controlled base, Gatow, landings reached a peak of one every 90 sec. (900 per day)—three times the maximum traffic at New York (La Guardia), formerly the busiest in the world. The original steel-mesh runway was extended by 1,500 ft. of concrete, and, parallel to this, a new 6,000 ft. concrete runway was constructed. The airports from which Berlin was supplied all benefited materially from the airlift. Hamburg (Fuhlsbüttel) had a new 6,000 ft. permanent runway in use, and Frankfurt (Rhein-Main) a second runway of 8,200 ft. under construction.

Italy. The airports of Rome (Ciampino) and Naples (Capodichino) were being improved with funds provided under the European Recovery programme—Ciampino had an imposing passenger-handling building in use—but an entirely new site for a Rome intercontinental airport was selected at Fogere, on the Tyrrhenian coast.

Netherlands. The fine steel-and-glass terminal building at Amsterdam (Schiphol) came into partial service in May 1949 with the transfer of all passenger arrivals and departures and with the opening of the two-floor restaurant above. The new control tower was completed but technical equipment was awaited. Concreting work was completed on the new north-south runway.
AIR RACES AND RECORDS—ALBANIA

Norway. An aviation commission, in June 1949 recommended new airports at Herdla, Gose and Bodø, the improvement of Oslo (Fornebu) and Stavanger (Sola) and the retention of the existing seaplane bases. Gardenmoen, a major military base 56 km. from Oslo, was scheduled to take the long-haul commercial traffic.

Portugal. A seaplane dock, 460 m. in length, was partially constructed at Cabo Ruivo (four mi. upstream from Lisbon); and Portela, the land airport, had a new administrative block under construction.

Sweden. The Stockholm (Halmstorp) project for an intercontinental land airport achieved limited development in 1949. By June, some Kr.10 million had been expended, mainly on blasting operations.

Switzerland. Geneva (Cointrin) would remain unique among Europe’s major airports in retaining a single broad 6,500 ft. runway. A new passenger handling block with a single long frontage and a hangar to house up to 10 four-engined aircraft were opened in May 1949. Zurich (Kloten), an entirely new postwar enterprise, had three runways all in use by the same date; and the permanent terminal buildings were due for completion in 1950. (G. D. H. L.)

United States. The 1949 Civil Aeronautics administration (C.A.A.) revision of the annual three-year forecast of constructions and improvements contemplated under the Federal Airport plan called for the building or improvement of 4,977 airports at a cost of $1,115,300,000 of which $510,600,000 would be federal funds and $604,700,000 state and local contributions. Under this programme for 1949-53, 2,794 new airports would be constructed and 2,183 improved. By the end of 1949 congress had appropriated $117,500,000 toward the total of $500 million it authorized in 1947. The projected programme included plans for a second large airport in the Washington area to relieve congestion at the Washington National airport.

The Aircraft committee of the Munitions board approved the C.A.A. sponsored slope-line system of approach lighting for airport runways in use by the army, navy, air force and commercial operators. Immediate installation of high-intensity approach lights utilizing the slope-line system was planned for the Washington National airport, Washington, D.C., and the Los Angeles International airport, Los Angeles, California. (See also Aviation, Civil.) (E. M. E.)

AIR RACES AND RECORDS. The year 1949 was important in British air racing history when the Royal Aero club promoted the first national air races. These were held at Birmingham (Elmdon) from July 30—Aug. 1, and incorporated the more important events in the racing calendar formerly held at Lympne and elsewhere. All eight events were held over a 20-mi. quadrilateral course, which, with the poor weather conditions, made high-speed flying a considerable test of skill. J. N. Somers in a Miles Gemini won the King’s cup and N. F. Duke in a Hawker P.1040 won the Kemsley challenge trophy with an average speed of 508 m.p.h. The Siddeley challenge trophy for British flying clubs was won by F. Dunkerley (Lancashire Aero club) and the challenge cup of the Society of British Aircraft Constructors for jet aircraft was won by T. S. Wade, at 510 m.p.h. average, in a Hawker P.1040.

The national air races of the U.S.A. were held at Cleveland in September. Four events were cross-country, and five round a closed circuit. All jet aircraft raced in classes, only one type being involved in each race. The Thompson trophy (jet division) was won by Captain B. Cunningham with an average speed of 586 m.p.h. His fastest lap was at 635-4 m.p.h. C. Cleland, in a F2G Corsair, won the R division of the trophy race with an average of 397 m.p.h.

There were few new official major air records. The absolute speed record set up by Major R. Johnson (U.S.A.) in a North American F-86 in Sept. 1948 was confirmed at 670-981 m.p.h. The U.S.A. recaptured the class records for helicopters (speed, 100-km. circuit, and altitude) with the Sikorsky S-52. A significant flight, though outside the official categories, was the round-world non-stop flight by a United States air force B-50 bomber. This involved air-to-air re-fuelling, whereas for the endurance effort of R. Woodhouse and W. Jongeward, who flew over Yuma, Arizona, for 46 days 20 hr. in a small single-engined Aerona, the aid of a fast moving car was invoked. William P. Odom flew a Beech Bonanza non-stop farther (4,957 mi., Honolulu to Peterboro, New Jersey) than any other light aeroplane in history.

Certain international point-to-point records are recognized by the Fédération Aéronautique Internationale. Five British flights in 1949 were accepted as best performances: London-Rome, in 2 hr. 31 min. (359 m.p.h.), and to Karachi in 15 hr. 20 min. (256 m.p.h.), by N. F. Duke, with Hawker Fury; London-Paris, in 20 min. 37 sec. (618 m.p.h.), by T. S. Wade, with Hawker P.1052; London-Malta, in 3 hr. 20 min. (388 m.p.h.), by W. R. MacWhirter and three other Royal Navy officers, with Sea Furies; Gibraltar-London, in 2 hr. 30 min. (436 m.p.h.), by A. C. P. Carver, with D.H. Hornet. (G. D. H. L.)

ALBANIA. A people’s republic in the western part of the Balkan peninsula bounded by Yugoslavia to the north and east and by Greece to the south, with an Adriatic coastline of 200 mi. Area: 10,629 sq. m.; only one-tenth of the total area is arable land (mainly the Adriatic littoral and the Korçë plain), about three-tenths being pastures and the rest forest, swamps and mountainous waste. Pop.: (1939 census) 1,063,000; (mid.—1948 est.) 1,173,000. Chief towns (1946 est.): Tirana (cap., 35,000); Scutari or Shkoder (30,000); Koritsa or Korçe (27,000). Elbasan (15,000). Language: besides the literary Albanian, there are two spoken dialects, the Gheg north of the river Shkumbi and the Tosk in the south. Religions (1946 est.): Moslem 800,000; Greek Orthodox 220,000; Roman Catholic 110,000. Chairman of the presidium of the People’s Assembly, Dr. Omer Nushani; prime minister, General Enver Hoxha (q.v.).

History. Owing to her strategic position Albania played an important role in Soviet policy which attempted to retain influence in the western Balkans. Despite a series of crises the Communist government continued its submissive attitude to Soviet direction, often at the expense of national interests. In June the hostile propaganda campaign against Marshal Tito reached its peak when, after a widespread purge of so-called Tito sympathizers, five members of the government were sentenced to various terms of imprisonment and the former deputy prime minister and minister of the interior, Koçi Xoxe (see Obituaries) was executed. Koçi Xoxe had declared in favour of maintaining relations with Yugoslavia. Yugoslavia denounced her treaty of friendship and mutual aid with Albania in November.

Completely isolated and deprived of normal trade with her Balkan neighbours, Albania’s economy became dependent on the Soviet Union. Albania was admitted to the Council for Mutual Economic Assistance on Feb. 22. From March 21 to April 10 Hoxha visited Moscow where negotiations resulted in an agreement with the U.S.S.R. to provide capital equipment for industrial development as well as large quantities of consumer goods. The five-year plan based on Yugoslav support, abandoned in 1948, was translated into a two-year plan on the Soviet model. Albania, however, was not granted membership of the Cominform and remained the only satellite country without a treaty of mutual aid with the Soviet Union.
It became clear in July that the Soviet Union was more interested in supplying Albania in order to maintain the Greek rebel movement and increase the tempo of the war against Marshal Tito than to prevent the Albanian population from starving. As the Greek rebellion drew to its close, so the number of ships bringing transport and food, but not capital equipment, from Soviet Black sea ports, rapidly diminished. The result was that the already poor economic situation became serious. There was famine in the south of the country and food shortages in many towns. Large numbers of refugees crossed the frontier into Yugoslavia. Deserter to the Greek government forces reported disaffection in the Albanian army. Responsibility for the internal disorder was pinned on to the minister of industry, Gogo Nushi. He was arrested on the grounds of sabotage in October.

Although there was a marked decline of Soviet interest in Albania in the last half of the year, a large Soviet military mission was maintained in Tirana and Soviet technicians continued work on the harbour defences at Vlore (Valona) and Durres (Durrës).

In the report of the United Nations Special Commission in the Balkans, Albania was indicted as the principal source of material assistance to Greek Communists. This report, submitted to the general assembly, provided irrefutable evidence to show that the Albanian armed forces had actively assisted the Greek rebels. Some 6,000 of them were given refuge in Albania when the civil war ended. All attempts by the United Nations to secure an understanding between Greece and Albania failed.

There was little opportunity for Albania to come into contact with the west. This, however, did not prevent the press and radio from bitterly attacking the western nations on such subjects as the North Atlantic treaty and Allied policy towards Germany.

The Free Albanian committee, formed in Paris during August, was singled out for special abuse. This committee composed of the anti-Communist wartime resistance leaders in exile pledged itself to "guide and encourage the Albanian people in their resistance to Communist tyranny." The Committee visited London and Washington during September.

**Education and Cultural Life.** (1949) Elementary schools 1,909, pupils 162,000, higher elementary (145) and secondary (20) schools with a total of 19,000 pupils. A teachers' college was opened at Tirana in Oct. 1949. Another was announced to be opened in Abant, and 14 other periodical publications with a total circulation of 83,000.

**Agriculture.** Main crops (in '000 metric tons, 1947) maize 140, wheat 34, tobacco (1945) 45, olives (prevare average) 17. Livestock (in '000 head, 1946 est.) sheep 1,548, cattle 345, horses 50, asses 40, mules 10; goats 854; pigs 35. First 20 collective farms were organized during 1949.

**Industry.** Petroleum is the main natural resource, no production figures were published after 1939 when Albania produced 229,278 metric tons of crude petroleum. Extraction of coal, copper ore and chromium ore started after World War II. There was also a cement factory in Shkoder and a brewery in Korçë. In June 1949 a two-year plan of development was adopted by the National Assembly. Out of a total expenditure of 2,050 million leks, 628 million were earmarked for an industrialization programme.

**Foreign Trade.** Main imports: food products, textiles and metals. Main exports: crude oil, skins, animals and animal products.

**Transport and Communications.** Roads (1949) 2,842 km. Licensed motor vehicles (Dec. 1948) cars 500, commercial vehicles 1,240. Railways (1949) 100 km. Shipping (1949) number of merchant vessels 6 (including two ships purchased in 1949 from Poland).

**Finance.** Monetary unit is the lek which until June 1948 was at par with the Yugoslav dinar. In July 1949 a state loan of 250 million leks— the first loan in Albanian history—was launched. On Oct. 1 all the banks were returned to state control and were withdrawn by new ones, but no information was published as to the amount of the currency circulation

**ALEMÁN, MIGUEL,** Mexican statesman (b. Sayula, Veracruz Sept. 29, 1903), was minister of the interior (1940-46). In a presidential election on July 7, 1946 in which there were four candidates he received 1,800,829 votes and was inaugurated as president on Dec. 2, 1946 for a six year term of office. On April 29, 1947, he arrived in Washington on an official visit thus repaying a visit by President Harry S. Truman to Mexico in March 1947. In 1949 his Partido Revolucionario Institucional obtained 143 seats in the Chamber of Deputies out of 147 in a general election held on July 3. His government devalued the peso on June 17 and, in his state of the nation address on Sept. 1, Aleman told the chamber of deputies that this action had saved Mexico from a crisis in foreign trade and from inflation. He pledged continued controls over prices and supplies of consumer goods and disclosed that the Bank of America had granted a $3 million loan for a highway across the isthmus of Tehuantepec. (See also Britannica Book of the Year 1949).

**ALGERIA:** see French Union.

**ALIENS.** The number of aliens registered in Great Britain at Oct. 1, 1949, was 429,342 (males 273,323; females 156,019). The figure at Jan. 1 was 410,600. The principal nationalities represented and the numbers of each compared with those in brackets at approximately the same date in 1948 were: Austrian, 11,034 (11,254); Belgian, 6,467 (8,241); Chinese, 9,367 (9,309); Czechoslovakian, 7,207 (6,837); Danish, 5,145 (4,753); Dutch, 9,158 (9,456); Estonian, 5,816 (6,025); French, 14,087 (13,019); German, 44,249 (42,252); Hungarian, 5,536 (5,155); Italian, 18,667 (17,680); Latvian, 13,855 (13,723); Lithuanian, 7,165 (7,355); Norwegian, 5,868 (5,585); Polish, 150,378 (136,336); Russian, 40,785 (36,254); Swiss, 13,107 (12,063); U.S.A., 16,656 (14,967). The figures included 13,000 aliens to whom no nationality could be attributed.

Among aliens not required to register and therefore not included in these figures were members of the diplomatic and consular services of foreign governments, certain officials of international organizations, members of allied forces on duty, British protected persons and short-term visitors who spent less than two months in the United Kingdom. As a result of the Burma Independence act, 1947, citizens of Burma became liable to register as aliens in March 1949.

The flow of foreign passenger traffic through United Kingdom ports continued to be heavy and in July 1949 101,768 aliens entered the United Kingdom and 84,076 departed; similar figures in July 1948 were 111,553 and 74,149. As a result of agreements concluded in and before 1949 nationals of the following countries were absolved from obtaining visas for travel to the United Kingdom: Belgium, Denmark, France, Iceland, Italy, Liechtenstein, Luxembourg, Monaco, the Netherlands, Norway, San Marino, Sweden, Switzerland and the United States.

The settlement of Poles for whom the British government assumed responsibility began in 1949 and by Sept. 30 the Polish Restlement corps had been wound up. By then, out of the 174,000 Polish servicemen brought to the United Kingdom after mid-1945, 61,500 had been repatriated and 17,000 assisted to emigrate. Of the remainder, 1,000 had died, 94,500 had been settled in civilian life in Great Britain and 31,000 persons dependent on them had been brought from abroad to join them.

By Oct. 1, 1949, some 76,000 aliens, mostly of Polish or Baltic origin, who had been temporarily accommodated in displaced persons' camps on the continent, had been admitted for employment in Great Britain with a view to settlement. With them came some 3,500 dependents. The number of aliens admitted after the end of World War II under compassionate schemes introduced to allow relatives in Great Britain to offer homes to aliens in isolated and distressed
circumstances abroad or the victims of political persecution rose to about 7,000. In addition some 1,000 aliens who had married British wives were allowed to remain in Great Britain with them in 1949. The repatriation of members of the German forces was completed by Dec. 31, 1948. Approximately 8,500 prisoners of Ukrainian origin were allowed to remain at their own request. Fifteen thousand German prisoners volunteered to stay and work in the agricultural industry as civilians and were allowed to bring over their wives and children to join them.

Between Jan. 1 and Oct. 1, 1949, 5,610 new applications for naturalization were lodged, compared with a yearly average of 1,708 before World War II. Certificates granted during the same period numbered 7,731, an annual rate of naturalization of approximately 10,300 as against 15,500 in 1948. Among the other effects of the British Nationality act, 1948, which came into operation on Jan. 1, 1949, was that British women who had lost their British nationality by marriage before that date regained it, the statutory qualification for British protected persons seeking naturalization was reduced and such persons were exempted from the provisions of the Aliens Restriction acts, and foreign women ceased to acquire British nationality automatically on marriage to a British subject but became eligible to secure it by applying for registration as citizens of the United Kingdom and colonies.

(T. G. W.)

United States. By using the true figures for immigration and naturalization and estimating alien mortality for the period of registration, it was possible to arrive at the approximate alien population. On such a basis it was estimated that there were approximately 3 million resident aliens in the continental United States in June 30, 1946. This estimate did not take into account visitors, that is, non-immigrants, and imported workers.

The number of non-citizens naturalized during the year which ended on June 30, 1949, was 66,594. This was the lowest number in 37 years. Included in this number were 35,131 naturalized persons who were married to United States citizens and 2,456 persons who had served in the armed forces of the United States. Throughout the year 2,271 naturalization petitions were denied.

During 1948-49, 8,575 persons lost their United States nationality: 4,515 by voting in a foreign political election or plebescite, 1,459 by entering or serving in the armed forces of a foreign state, 754 through naturalization in a foreign state, 694 naturalized citizens through prolonged residence in a foreign state and 1,153 for other reasons. Petitions for naturalizations were filed by 71,044 persons, an increase of 4.1% from the fiscal year 1948, when 68,265 petitions were filed.

Alien Enemies. At the beginning of the 1949 fiscal year there were 174 Germans and 27 Japanese still under orders of removal issued by the attorney general, pursuant to the presidential proclamation of July 14, 1945. Of the Germans, 75 departed or were removed from the United States during the fiscal year as the result of the supreme court decision in the case of Kurt G. W. Ludecke v. W. Frank Waters handed down on June 21, 1948, upholding the right of the government to remove or deport under the Alien Enemy act of 1979 interned alien enemies deemed by the attorney general to be dangerous because they had adhered to an enemy government or to the principles thereof; 58 were released outright; 3 were released by court order; and 6 were paroled pending further administrative determination of their cases. In view of the decision handed down by the supreme court in the case of Klapprott v. United States, execution of removal orders was deferred in the 29 denaturalization cases remaining for further administrative consideration. Only 3 Germans were still detained at Ellis Island at the close of the fiscal year.

(W. B. M.)
acute malnutrition. As a result patients were much more able to withstand further hemorrhages.

An article by T. L. Althausen published in 1949 on the prevention of recurrences of peptic ulcer after medical treatment was characteristic of numerous contributions on this important phase of treatment of ulcers, which had been insufficiently stressed in the past. Factors which could cause reactivation or recurrence were emotional tension, physical fatigue, respiratory infection, alcohol, tobacco, condiments, beverages containing caffeine, stimulating or coarse foods and hurried, improper mastication. Emphasis was placed upon the institution of a protective regimen during periods of stress or former seasonal worsening of the disease. Continued co-operation with respect to diet, medication and hygiene was usually achieved only by fully acquainting the patient with the nature of the disease and the reasons for the treatment. Favourable results continued to be reported by proponents of vagotomy (cutting of both vagus nerves) in the treatment of chronic ulcer of the stomach and duodenum. Many U.S. surgeons felt that vagotomy, as an exclusive primary procedure, should be abandoned. For example, it was done only three times at the Mayo clinic at Rochester, Minnesota, during 1949 in primary operations on 429 patients with duodenal ulcers. Subtotal gastric resection still remained the method of choice for duodenal ulcers. Vagotomy was recommended especially for patients who previously had undergone operations such as pyloroplasty, gastro-enterostomy or gastric resection, and who later had recurrent ulceration, particularly anastomotic ulcers. For patients considered to have a good chance of post-operative recovery, many surgeons preferred to excise or resect the recurrent ulcer at the time vagotomy was performed.

**Liver and Gall Bladder.** The advantage and safety of needle biopsy of the liver, in competent hands was increasingly apparent. Combined biopsy and tests of hepatic function were most illuminating even though the results from the respective investigations did not always parallel each other. Such combined procedure, plus thorough clinical study, represented distinct progress in the diagnosis and treatment of hepatobiliary disease. M. W. Comfort, H. K. Gray and J. M. Wilson reported observations on 112 patients who had asymptomatic gallstones found incidentally during the course of abdominal operations. Follow-up data on these patients for 10 to 20 years revealed that indigestion supervised in 30, biliary colic in 21 and both jaundice and colic in 5. The remainder, exactly half the total, continued to be asymptomatic. The authors concluded that surgical treatment for silent gallstones may be classified as optional. Surgery should not be postponed, however, especially after colic occurs.

**Intestines.** The investigations of Almy and his associates confirmed the important role of emotional stress in the alteration of colonic function, similar in kind and degree to those alterations seen in patients with irritable colon. In a review of 726 consecutive cases of diverticulosis of the colon, F. H. Goodwin and E. N. Collins noted the following features: the cause of the condition was unknown; the site of the diverticula in most instances was the pelvic colon; three-quarters of the patients were 50 years of age or older; two-thirds were overweight; and symptoms, signs and mode of treatment were similar to those of irritable colon. Other observers estimated that the inflammation would develop in 10 to 20% of cases of diverticulosis. Medical treatment was indicated for the majority of the patients during an attack of the inflammatory condition as well as before operation.

AMERICAN LITERATURE. General and Historical.
The phenomenon of the year 1949 in non-fiction books was the popularity of works on religious subjects. On the best-seller lists were Thomas Merton’s The Waters of Sillou, a history of the Trappist Order, Fulton J. Sheen’s Catholic Peace of Soul, and Fulton Oursler’s Greatest Story Ever Told, a retelling of the gospel. Harry Emerson Fosdick retold the life of Jesus in The Man from Nazareth. Reinhold Niebuhr’s study of the place of religion in civilization, Faith and History, was an important book. In contrast to these appeared two carefully documented studies of the growing power of the Catholic church in temporal affairs: Paul Blanshard’s American Freedom and Catholic Power and Avro Manhattan’s milder The Vatican in World Politics. Vannevar Bush’s Modern Arms and Free Men asserted that the atom bomb does not make other weapons obsolete and proposed a politically conservative laissez-faire solution. Theodor Rosebury, in Peace or Pestilence, analysed the frightening facts of biological warfare and favoured a liberal political policy as the way to avoid the possible catastrophe.

Samuel Eliot Morison added two more volumes to The History of United States Naval Operations in World War II, “Coral Sea, Midway and Submarine Actions” and “The Struggle for Guadalcanal.” Oliver La Farge wrote a history of the Air Transport command in World War II, The Eagle in the Egg. Fletcher Pratt made a study of outstanding generals from Nathanael Greene to Omar Bradley, Eleven Generals. General H. H. Arnold’s Global Mission combined his own life story with a history of the army air force. Many books dealt with world affairs and the U.S. role in them. Howard Smith’s State of Europe was a description and interpretation of developments in European countries since World War II. Owen Lattimore, in his Situation in Asia, reported not only on China but also on India and Indo-China. Anna Louise Strong’s Chinese Conquer China described her view of China’s ways of solving its own problems.

On the problem of race relations in the United States E. Franklin Frazier’s The Negro in the United States was an authoritative factual survey of the Negro from slavery to the
F.E.P.C. Lillian Smith's *Killers of the Dream* tried to shock the reader into realization of the Negro's desperate situation. Ray Sprigle's *In the Land of Jim Crow* set forth his experiences in the South, where he passed as a Negro. Carey McWilliams, in *North from Mexico*, studied the mis-treatment of Mexican minorities in California.

Margaret Mead, in *Male and Female*, recorded the battle of the sexes in a changing world. Clyde Kluckhohn's *Mirror for Man* discussed the relation of anthropology to modern life. H. A. Overstreet's *The Mature Mind* analysed how mass media of communication perpetuate immaturities and infantilisms. Catherine MacKenzie presented a synthesis of the work of experts in the field of child psychology in *Parent and Child*. Lincoln Barnett's *The Universe and Dr. Einstein* explained the scientist to the layman.

Other books which studied phases of the U.S. scene or U.S. culture were Oliver Larkin's *Art and Life in America*, an analysis of the inter-relation of American art and thought, and Roger Burlingame's *Backgrounds of Power*, a history of mass production and its social effects. Isabel Leighton edited *The Aspern Age*, 1919-1941, a volume of essays by Samuel Hopkins Adams and others on U.S. life between World Wars I and II.

The most widely read memoirs of the year were Fleanor Roosevelt's *This I Remember*, a factual account by the president's wife. Grace Tully published *F. D. R.—My Boss*, the story of the president as his secretary saw him. Edward Stettinius' *Roosevelt and the Russians* revealed the inner workings of the Yalta conference and the attempts of the United States to co-operate with the U.S.S.R.

Historical works included Ray Allen Billington's *Westward Expansion*, a definitive study, in the tradition of Frederick Jackson Turner, of the frontier in United States history. The two chief Lincoln books were Kenneth P. Williams' *Lincoln Finds a General*, a military history of the Civil War, and Carl Sandburg's *Lincoln Collector*, papers from the Barret Collection with extended comment.

*Novels*. Good novels appeared which, although chiefly concerned with character, exploited unusual settings or occupations. John Brooks's *The Big Wheel* showed how a big-time slick news-weekly gets written. Tom Lea's *The Brave Bulls* told the adventures of a Mexican matador. George Weller's *The Crack in the Column* gave a detailed and accurate explanation of the Greek resistance movement and civil war. One of the year's best novels was Nelson Algren's *The Man With the Golden Arm*, which dug deep into the materials and people of the Polish slums of Chicago *Without Magnolias*, by Bucklin Moon, projected realistically the Negro's position in the South. *The Scare*, by Merle Miller, set forth the catastrophic effects of witch hunts on government employees. Albert Maltz, in *The Journey of Simon McKeever*, created a dignified and almost tragic character and also focused attention on the problems of the old age pensioner. William L. Gardner Smith's perceptive story of a Negro in the U.S. army of occupation in Germany, *Last of the Conquerors*, was a picture of how democracy sometimes fails to work. Haakon Chevalier's *For Us The Living* used a background of west coast fruit packer and labour disputes for his story of murder. Kay Boyle's novel of oblique characterization, *His Human Majesty*, used a ski troop training centre.

Among novels concerned with character was one of the most distinguished first novels of the year, Paul Bowles's *The Sheltering Sky*. Although the North African setting was a vivid part of the book, it was his mature and sensitive portrayal of somewhat existentialist characters involved in a triangle situation which marked the book. Another novel which probes delicate human relations was Isabel Bolton's *The Christmas Tree*, a story which explored the sources of homosexuality.

Sinclair Lewis' *The God-Seeker*, an American frontier novel, was dubiousy received and was criticized as the work of a bored, reformed satirist. William Faulkner published *Knight's Gambit*, a group of short semi-detective stories and a novella set in the familiar Faulkner South and involving characters from his *Intruder in the Dust*. James Branch Cabell published *The Devil's Own Dear Son*, an ironic tale of a man who set out to find his real father, the Devil. John Dos Passos completed his New Deal trilogy with *The Grand Design*. Upton Sinclair brought Lanny Budd to friendly terms with President Truman and the world in general in *O Shepher, Speak!* Pearl Buck's *Kinfolk* was a novel of modern China; Jerome Weidman satirized the business world in *The Price Is Right*; and Mary Ellen Chase's *The Plume Tree* was a neatly written story of insane old ladies in a nursing home.

Among volumes of short stories Eudora Welty's *The Golden Apples* gave a connected picture of life in the Mississippi country. Truman Capote, in *A Tree of Night*, and Other Stories disected a group of disturbed personalities. Shirley Jackson skilfully combined the macabre and the familiar, especially in the title story of *The Lottery*: or *The Adventures of James Harris*, *Bem's Letters*. The most conspicuous token of the concentrated interest in Henry James was Leon Edel's edition of *Complete Plays*. The enormous quantity of research upon Herman Melville that occupied scholars during the '40s began to appear. Two major critical works were Howard P. Vincent's *The Trying-Out of Moby-Dick*, a fascinating quest for the book's sources and an illuminating interpretation of its meaning; and Richard Chase's more subjective *Herman Melville: A Critical Study*, which undertook a complex interpretation and analysis of all his works. A specialized study was made by Nathalia Wright in *Melville's Use of the Bible*. The reissue of Melville's own writings continued. Henry A. Murray edited *Pierce*, the third volume in the scholarly new Complete Works. Jay Leyda's edition of *The Complete Stories of Herman Melville* made available the neglected magazine pieces. The *Confidence-Man* was reprinted for the first time in the United States.

There were a number of biographies of important U.S. writers, the most impressive of which was Ralph L. Rusk's definitive *Life of Ralph Waldo Emerson*, which was an exhaustively factual rather than critical or intellectual study. Most favourably received by historians and literary scholars was Ernest Samuels' *The Young Henry Adams*, published at the close of 1948, the first volume of a projected 2-volume biography. John A. Pollard wrote an excellent *John Greenleaf Whittier, Friend of Man*. Three volumes were added to the fine American Men of Letters series: Mark Van Doren's *Nathaniel Hawthorne*, James Grossman's *James Fenimore Cooper* and Perry Miller's *Johnathan Edwards*. Robert H. Elias wrote a good study of *Theodore Dreiser* and Dixon Wecter edited the *Love Letters of Mark Twain*.

Donald Stauffer contributed to Shakespeare scholarship with his *Shakespeare's World of Images* and Francis Fergusson wrote an important analytic study of drama as the imitation of action, *The Idea of a Theatre*. There also appeared the first translation since 1908 of Miguel de Cervantes' *Don Quixote*, in idiomatic modern English, by Samuel Putnam.

Theodore Roethke's *The Lost Son*, and *Other Poems*, centring about greenhouse imagery, was well received by the critics. Ellis Fosette wrote *Layman's Fall*: *A Fantasy in the Joyous Mode*, a long symbolic poem. Richard Eberhart's
ANÆMIA

ANÆMIA. In 1949 vitamin B₁₂ came into general use in the treatment of pernicious anaemia and certain other macrocytic anemias. Its value in the production of remissions was confirmed repeatedly, and its efficiency in checking the progress of neurologic and tongue symptoms was established. The mechanism of its action was still a problem, but some investigators felt that it was the same as the "extrinsic" factor of W. B. Castle and was identical with the anti-pernicious anemia principle of liver. It was postulated that the "extrinsic" factor did not react with the intrinsic factor, as was previously thought, but facilitated the absorption of the intrinsic factor. Vitamin B₁₂ was not readily absorbed when given by mouth unless given in large amounts, or accompanied by intrinsic factor (normal gastric juice).

Folic acid continued to prove effective in the treatment of macrocytic anemias, but the effect was less pronounced than with liver derivatives. In the hands of different investigators the reaction to the neurologic changes varied. While some noted improvement or the absence of aggravation of symptoms, others found development or progression of the cord changes; these could be eliminated, however, with large amounts of liver extract. Good results followed its uses in the macrocytic anemia of pregnancy, even when liver extract proved inadequate.

Sub-acute combined degeneration of the spinal cord in pernicious anaemia was found to be reversible if intensive liver or vitamin B₁₂ therapy was instituted before the axis cylinders had been destroyed. In some patients, glossitis responded to treatment with members of the vitamin B complex, not effective in improving the blood.

Relapses in ability to produce new blood cells in pernicious anaemia followed the discontinuance of liver extract in from 8 to 18 months, although some did not show anemia over a period of 26 to 29 months. Vitamin B₁₂ was found to be effective in the megaloblastic anemia of infancy.

Increased attention was given to the iron deficiency anemias and the mechanism of absorption of iron. Radioactive iron was absorbed by the cells of the circulating blood in proportion to the number of reticulocytes. During infection or in the presence of an abscess (turbentine) there was a fall in plasma iron and a delay in the uptake of radio-iron by the red blood cells, although the deficiency was less marked in anemic dogs on a diet with a low iron content. In recovery from anemia of infection, there was a sharp increase in the iron binding capacity of the serum, although the low serum iron concentration associated with anemia in acute and chronic infections was not the result of the low iron binding capacity of the serum. In iron deficiency anemia there was a low percentage saturation of the iron-binding material of the serum.

In dogs with anemia of hemorrhage, hemoglobin regeneration was most definite after liver or beef muscle feeding, whereas total blood proteins regenerated well after liver, meat, casein and egg proteins. In anemic rats hemoglobin regeneration followed the use of dietary proteins in the following order: first eggs, then meat, processed soya, casein, peanut, maize, wheat and gelatine. Of these, casein, soya and maize protein were more effective in hemoglobin regeneration. In diets with caloric deficiency, hemoglobin regeneration was favored at the expense of weight recovery. Molybdenum-iron complex was found to be more effective in some patients with anemia during pregnancy than other forms of iron. An iron-sucrose preparation was developed which was effective when given intravenously with only the minimum reactions.

Vegetarian Indian soldiers in Iraq had significantly lower blood levels than meat-eating individuals, several showing nutritional macrocytic anemia, even though they were on a 3,000-calorie diet with 80 gr. of vegetable protein. One hundred and twenty-seven cases of severe refractory, tropical macrocytic anemia were found in Sepoys serving in Assam and eastern Bengal. The most effective therapeutic measures were adequate diet, control of infections and transfusions, but 38% died.

Acute hemolytic anemia appeared in approximately 2% of all births in otherwise healthy Rh-positive infants when there had been placentarian immunization of the mother with the Rh antigen.

Breaks in the fetal and maternal blood vessels in the placenta accounted for the contact of fetal and maternal blood in erythroblastosis fetalis, allowing the aglutinative and hemolytic maternal antibodies to destroy the fetal cells and produce a hemolytic anemia. Exchange transfusions in newborn babies with hemolytic anemia reduced the mortality from 63% to 18%. After the use of Rh hapten, 20 of 27 babies with severe erythroblastosis recovered and remained well, 5 dying of other causes. A number of reports added to the data on Rh occurrence, types, variants and inheritance.

Acute macrocytic anemia developed in rats several weeks or months after the surgical formation of a blind loop in the small intestine. Nutritional macrocytic anemia was produced in swine by feeding a purified diet containing a folic acid antagonist. In 45 patients with tropical macrocytic anemia, improvement was noted in 39 after the use of refined liver extract.

Severe hypoplastic anemia was noted in seven patients who had prolonged administration of atabrine. Recovery was spontaneous and gradual, apparently not influenced by therapeutic measures.

ANÆSTHESIOLOGY. The introduction of decamethonium bromide (C₁₀) under the trade name of Synacthane gave workers in anesthesiology and in the field of shock therapy an agent with a curare-like effect but one which was easier to obtain and prepare for use. A safe and effective antidote, however, was not known. The action of this agent appeared to be less lasting than that of curare, the duration of a fully effective dose being from a third to a fourth of as many minutes as for curare. Decamethonium bromide produced less effect on the pharyngeal and respiratory muscles than curare and was less active than the latter in causing the release of any histamine-like substance. The optimal dose was 2 to 3 mg., injected at the rate of 1 mg. a minute. It appeared to act quickly, that is, in the matter of a minute or two, as compared to the five to ten minutes required for the action of curare. Satisfactory and safe relaxation was obtained with the use of this new drug.
The use of dolamin (benzyl alcohol 0.75%, ammonium sulphate 0.75%, sodium chloride 4.8% in an ampule with sufficient water to make 10 cc.) prevailed; the effect could never be predicted. In cases in which little of the material was to be used on only one or two nerves, variations in the solution were tried, such as omitting the benzyl alcohol and increasing the ammonium sulphate up to 1.5% or in some cases up to 2.5% of the solution. The checking of accurate placement of needles by roentgenograms continued and greater accuracy in technique was developed. It was made clear that paravertebral somatic injection of alcohol near the nerve roots could not be repeated for some weeks after the first injection without danger of a bizarre pattern of paralysis.

R. E. Courtin described seven electroencephalographic levels of anaesthesia and suggested their use as practical measures of the depth of anaesthesia. Subsequently R. G. Bickford invented a device which automatically controlled the depth of anaesthesia both in human beings and animals. The apparatus which injected the anaesthetic agent worked on the principle of activation by the electrical potentials emanating from the brain of the subject. (See also SURGERY.) (J. S. L.)

ANDORRA. A small autonomous state between France and Spain, bounded on the north by the départements of Ariège and Pyrénées Orientales, and on the south by the Spanish province of Lerida. Area: 191 sq. mi. Pop. (1945 est.): 5,300. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja (pop. c. 1,000). Co-princes: the president of the French republic and the bishop of Urgel, Spain, respectively represented in 1949 by André Bertrand and Jaime Sansa Nequi, their viguiers. An elected General Council of 24 members appoints one of its members as the syndic général des vallées (from 1946, Francisco Cayrat).

The event of the year was an order given on March 8 by a Paris court to the Radiodiffusion Française to cease jamming the broadcasts of Radio Andorra. This order was confirmed by the Paris Court of Appeal on May 24. The jamming had started in April 1948 when the proprietors of Radio Andorra refused to sell their station to a French concern.

The General Council suggested during the year the building of an airfield and the linking of Andorra to the international telephone trunk system; but from 1945 the strained relations between France and Spain had rendered any common decision by the two viguiers practically impossible.
Andorra had 13 local policemen, but from 1944 a hundred French gardes mobiles were stationed on Andorran territory for the purpose of maintaining order.

**ANGLICAN COMMUNION.** Early in 1949 most of the bishops of the overseas Churches of the Anglican communion were occupied after their return from England with the resumption of diocesan duties and with discussion on the work and findings of the Lambeth conference (1948), and in some cases of the Amsterdam World Council of Churches.

The provincial synod of the Church in the West Indies accepted resolution 96 of the Lambeth conference, which allowed discretion to the diocesan bishops to grant or refuse permission to divorced persons to take part in the Holy Communion. The synod transferred this sanction to the archbishop of the province, who was granted the right to appoint two diocesan bishops to decide whether or not the case might be treated as a nullity case. In this event the bishop of the diocese concerned might admit the applicant to Communion. A new political order was being framed for the West Indies, and an appeal was made for a better educated clergy who might help to train leaders and meet the demand for higher education. Great progress was reported from the diocese of Trinidad after three years’ work of Bishop Fabian Jackson.

In the United States 11 bishops from Great Britain, Ireland and the West Indies (bishops of London, Oxford, Bath and Wells, Glasgow, Derry, Barbados, Bermudas, Honduras, Nassau, Puerto Rico and Trinidad) made an extensive tour of U.S. cities and addressed Eucharistic congresses of the Protestant Episcopal Church held in connection with the fourth centenary of the Book of Common Prayer. The bishop of London preached in New York, Dallas, Los Angeles, San Francisco and Seattle. President Truman received the bishops at the White House.

The archbishop of York (q.v.) preached at Washington and addressed the general convention of the Episcopal Church at San Francisco. In the course of its proceedings the triennial general convention, sitting under the presiding bishop of Massachusetts (Dr. Henry Knox Sherrill) received a report from a special committee of the house of bishops appointed in 1946 to consider canon 18 (on marriage). That canon took away the right of the innocent party in a divorce suit to be married in church, unless the conditions of nullity existed at the time of the first marriage. This left the matter ambiguous and different interpretations of the canon had been given. However, the committee advised no change during the next three years. In the meantime a joint committee of bishops and laymen was to examine the whole question and report to the next triennial convention. The Convention recommended psychiatric tests for ordination candidates in order to ascertain their mental and nervous condition. Intinction was authorized at Holy Communion as an alternative method of administration, but at the discretion of the diocesan bishop. From 1957 all clergy would retire at the age of 72 from active work, although they might take occasional duty. The convention adopted the highest budget on record ($56 million). It agreed to support the Church of England at St. Augustine’s college, Canterbury, for the higher training of post-ordination candidates from all over the Anglican Communion. The lower house of the Canadian Church proposed to sanction the remarriage in church of the innocent party in a divorce suit.

In South Africa the Anglicans joined representatives of other churches in a deputation to Dr. D. F. Malan, the prime minister, on Native rights. A hearing was not granted. Dr. Geoffrey Clayton, bishop of Johannesburg, succeed Dr. John Russell Darbyshire, who had died in England during the Lambeth conference in 1948, as archbishop of Capetown. New bishoprics for Basutoland and Matabeleland, to be carved out of Bloemfontein and Southern Rhodesia, respectively, were being planned.

In South India 36,000 Anglicans at Nandyal (Telugu country) were standing out of the new united Church of South India, and were placed under the supervision of the metropolitan bishop of Calcutta. In spite of political disturbances in Burma the Anglican Church was holding firm. It was encouraged by a visit of the metropolitan of Calcutta. The archbishop of New Zealand toured in Polynesia, especially in Fiji. The bishop of Singapore (J. L. Wilson) became dean of Manchester and canon H. W. Baines of Rugby replaced him at Singapore. The central committee of the World Council of Churches set up at Amsterdam in 1948, held its first meeting at Chichester under the chairmanship of Dr. G. K. A. Bell, bishop of Chichester. In the autumn Dr. Bell left for a tour of the churches in Australia and New Zealand, and visited the Church of South India on the way home. The synod of the diocese of Sydney prohibited the use of eucharistic vestments.

The general synod of the Church of Ireland considered new state prayers to meet the new conditions created by the separation of Ireland from the United Kingdom. Admission of women to diocesan synods and councils was approved. The fourth centenary of the Prayer Book was celebrated throughout the Church. The bishop of Llandaff (Dr. John Morgan) became archbishop of Wales. Proposals for the revision of the Welsh Prayer Book were considered by the synod. (See also CHURCH OF ENGLAND; MISSIONS; FOREIGN RELIGIOUS; THEOLOGY; WORLD COUNCIL OF CHURCHES.) (A. J. MAC.)

**ANGLING.** Sea-anglers enjoyed a successful year. In the North sea the tunny-fishing was the best since 1933 and the total catch of 43 included a fish weighing 852 lb. (a new British record). Other record fish caught during 1949 were a female tope of 73 lb. 3 oz. from Hayling island, Hampshire, a flounder of 4 lb. 13 oz. from Exmouth, Devon, and a plaice of 7 lb. 64 oz. from Teignmouth, Devon. The festivals were well attended, Folkestone’s (Kent) entry including several French anglers, while Brighton’s (Sussex) figure of 850 was

![J. H. Lewis of Scarborough, Yorkshire, with a tunny fish weighing 852 lb. which he caught in Sept. 1949.](image)
The survey work of the British in the Falkland Islands dependencies continued from a chain of bases stretching from the South Orkney islands to South Graham land. In 1948, exploratory sledge journeys were made continuously from Hope bay in the north of Graham land and in 1949 from Marguerite bay on the west coast in lat. 68° S. In the north existing maps of the Trinity peninsula were corrected and the survey advanced down the west coast. But most of the year's scientific work and two lives were lost in a fire which destroyed the Hope bay base hut in Nov. 1948. From Marguerite bay two remarkable journeys were made down the King George VI sound of 80 days' duration and emperor penguins, of which little was known, were kept in captivity and studied. It was an unfortunate year as plans to carry the survey farther south by setting up new bases were thwarted by abnormal ice conditions of the last Antarctic summer. This prevented the survey vessel "John Biscoe" relieving the Hope bay party till February and from ever reaching Marguerite bay at all. She sailed in the autumn of 1949 for the following season and with two aircraft it was expected that it would be possible to rescue the marooned party.

It was intended to use "weasel" (light, tracked carriers) and aircraft from a new base on Alexander I land and penetrate far into the dependencies while a specially equipped motor vessel was to be used for hydrographic work, but both these projects had to wait for a more open season. Deception island had the busiest Antarctic port (Port Foster) and this had lately been re-charted by Admiralty hydrographers. From here, meteorological reports were combined with information from other bases and reports from the big station at Port Stanley in the Falkland islands. This station had the latest "radio-sonde" system of transmitting upper air conditions so that shipping over a wide area could now be provided with reliable weather forecasts which were essential in predicting ice movement.

The South Africans on Marion island in lat. 45° S. carried out continuous meteorological observations and were in regular wireless contact with their counterparts in the Australian Antarctic expedition on Heard and Macquarie islands. This latter expedition was unable to set up a base in Feb. 1948 at Commonwealth bay on the mainland so they landed parties on the two islands which became permanent bases for meteorological observations and cosmic ray counts.

The French expedition ship, "Commandant Charcot," was also prevented by ice from reaching Adelie land in March 1949. It had a Stinson monoplane and an American "weasel" on board and if ice forbade access to the continent, an alternative programme was arranged for the party to work on Kerguelen island.

Argentines and Chileans set up bases on islands off Graham land and claimed territory in the Falkland islands dependencies sector. Also, the U.S.S.R. showed interest though, with the exception of whaling in the years 1947-49, there had been no Russian expeditions to the Antarctic since Fabian von Bellingshausen's great voyages of 1819-21. The whaling industry flourished and in the 1948-49 season Norwegian and British whalers in south polar waters reported good catches. (See also EXPLORATION AND DISCOVERY.) (S. St. C. Mc. N.)

ANTHROPOLOGY. The meeting of the International Congress of Prehistoric and Protohistoric Sciences, to have been held in Budapest in 1949, did not take place and there were no important international gatherings in Europe that year. The International Congress of Americanists met in New York in September and was attended by delegates from Europe; an invitation to hold the next session in 1952 in Europe was accepted. The International Congress of Anthropological and Ethnological Sciences continued, through the committee appointed at its last session (Brussels, Aug. 1948), to consider its international status and organization, particularly the question of affiliation to the newly created International Union of Philosophical and Humanistic Studies, which would represent the social sciences and be the channel for all dealings with U.N.E.S.C.O.

During the year important contributions were made in the sphere of human palaeontology and results were made known of discoveries throwing light on the problem of the antiquity of man. Dr. Robert Broom, of South Africa, visited England and in addresses to learned societies described finds of a men remains in South Africa over a period of years. In his address to the Royal Anthropological institute he surveyed the history of the work done since 1925, when Professor R. A. Dart described the skull of a child (called a "missing-link") skull, to the present day, the latest finds being of a large ape-man with a jaw larger than that of man but with human teeth.

Professor H. V. Vallois, director of the Institute of Human Palaeontology of Paris, gave some results of similar researches in France when he spoke to the Royal Anthropological institute on "les hommes fossiles de Fontechavade et le problème de l'origine de l'homme." A. T. Marston re-opened the question of the Piltdown skull in an address to the Royal Anthropological institute in which he argued that the mandible was that of an ape of about 10 years old whereas the cranium was of modern type man (perhaps Wurmian) of about 40 years old. A fluorine test was called for. At the British Association for the Advancement of Science meeting of the year Dr. K. P. Oakley reported results of the fluorine age-test on various specimens; these results suggested that the Galley Hill skull belonged to a post-paleolithic period, that the Piltdown skull and jaw fragments were all of much the same age as one another and not likely to be older than the pre-Wurm interglacial. The Swanscombe fragment, on the other hand, seemed to belong to the lower Paleolithic, as its apparent association with a biafacial hand-axe had long suggested. Dr. Broom supported this thesis with reference to the Piltdown skull and claimed that scarcely any doubt could remain that both skull and jawbone belonged to the same individual, one of the big-brained type which evolved with Homo sapiens.

The collection of blood group data was included in the work of an expedition to east Africa, organized by the University of Oxford Exploration club. Professor F. E. Zeuner visited archaeological sites in India.

In France, at Angles-sur-l'Anglin in Vienne département, Professor D. A. E. Garrod excavated an early Magdalenian
The survey work of the British in the Falkland Islands dependencies continued from a chain of bases stretching from the South Orkney Islands to South Graham land. In 1948, exploratory sledge journeys were made continuously from Hope Bay in the north of Graham land and in 1949 from Marguerite Bay on the west coast in lat 68° S. In the north existing maps of the Trinity Peninsula were corrected and the survey advanced down the west coast. But most of the year's scientific work and two lives were lost in a fire which destroyed the Hope Bay base hut in Nov 1948. From Marguerite Bay two remarkable journeys were made down the King George VI sound of 80 days' duration and emperor penguins, of which little was known, were kept in captivity and studied. It was an unfortunate year as plans to carry the survey further south by setting up new bases were thwarted by abnormal ice conditions of the last Antarctic summer. This prevented the survey vessel "John Biscoe" relieving the Hope Bay party till February and from ever reaching Marguerite Bay at all. She sailed in the autumn of 1949 for the following season and with two aircraft it was expected that it would be possible to rescue the marooned party.

It was intended to use "weasel" (light, tracked carriers) and aircraft from a new base on Alexander I land and penetrate far into the dependencies while a specially equipped motor vessel was to be used for hydrographic work; but both these projects had to wait for a more open season. Deception Island had the busiest Antarctic port (Port Foster) and this had lately been recharted by Admiallty hydrographers. From here, meteorological reports were combined with information from other bases and reports from the big station at Port Stanley in the Falkland Islands. This station had the latest "radio-sonde" system of transmitting upper air conditions so that shipping over a wide area could now be provided with reliable weather forecasts which were essential in predicting ice movement.

The South Africans on Marion island in lat. 45° S carried out continuous meteorological observations and were in regular wireless contact with their counterparts in the Australian Antarctic expedition on Heard and Macquarie Islands. This latter expedition was unable to set up a base in Feb. 1948 at Commonwealth Bay on the mainland so they landed parties on the two islands which became permanent bases for meteorological observations and cosmic ray counts.

The French expedition ship, "Commandant Charcot," was also prevented by ice from reaching Adelie land in March 1949. It had a Stinson monoplane and an American "weasel" on board and if ice forbade access to the continent, an alternative programme was arranged for the party to work on Kerguelen island.

Argentines and Chileans set up bases on islands off Graham land and claimed territory in the Falkland Islands dependencies sector. Also, the U.S.S.R. showed interest though, with the exception of whaling in the years 1947-49, there had been no Russian expeditions to the Antarctic since Fabian von Bellinghausen's great voyages of 1819-21. The whaling industry flourished and in the 1948-49 season Norwegian and British whalers in south polar waters reported good catches. (See also EXPLORATION AND DISCOVERY.) (S. ST. C. MC. N.)

ANTHROPOLOGY. The meeting of the International Congress of Prehistoric and Protohistoric Sciences, to have been held in Budapest in 1949, did not take place and there were no important international gatherings in Europe that year. The International Congress of Americanists met in New York in September and was attended by delegates from Europe; an invitation to hold the next session in 1952 in Europe was accepted. The International Congress of Anthropological and Ethnological Sciences continued, through the committee appointed at its last session (Brussels, Aug. 1948), to consider its international status and organization, particularly the question of affiliation to the newly created International Union of Philosophical and Humantistic Studies, which would represent the social sciences and be the channel for all dealings with U.N.E.S.C.O.

During the year important contributions were made in the sphere of human paleontology and results were made known of discoveries throwing light on the problem of the antiquity of man. Dr. Robert Broom, of South Africa, visited England and in addresses to learned societies described finds of ape-men remains in South Africa over a period of years. In his address to the Royal Anthropological institute he surveyed the history of the work done since 1925, when Professor R. A. Dart described the skull of a child (called a "missing-link" skull), to the present day, the latest finds being of a large ape-man with a jaw larger than that of man but with human teeth.

Professor H. V. Vallois, director of the Institute of Human Paleontology of Paris, gave some results of similar researches in France when he spoke to the Royal Anthropological institute on "les hommes fossiles de Fontéchavade et le problème de l'origine de l'homme." A. T. Marston re-opened the question of the Pitddown skull in an address to the Royal Anthropological institute in which he argued that the mandible was that of an ape of about 10 years old whereas the cranium was of modern type man (perhaps Würmian) of about 40 years old. A fluorine test was called for. At the British Association for the Advancement of Science meeting of the year Dr. K. P. Oakley reported results of the fluorine age-test on various specimens, these results suggested that the Galley Hill skull belonged to a post-paleolithic period, that the Pitdown skull and jaw fragments were all of much the same age as one another and not likely to be older than the pre-Würm interglacial. The Swanscombe fragment, on the other hand, seemed to belong to the lower Paleolithic, as its apparent association with a bifacial hand-axe had long suggested. Dr. Broom supported this thesis with reference to the Pitddown skull and claimed that scarcely any doubt could remain that both skull and jawbone belonged to the same individual, one of the big-brained type which evolved with Homo sapiens.

The collection of blood group data was included in the work of an expedition to east Africa, organized by the University of Oxford Exploration club. Professor F. E. Zeuner visited archaeological sites in India.

In France, at Angles-sur-l'Anglin in Vienne département, Professor D. A. E. Garrod excavated an early Magdalenian...
rock shelter. The museum of Aix-en-Provence was enriched by finds at Entremont, the site of the capital of the Saluvii, long known as an important pre-Roman site. The excavations, started in 1943 for war purposes, resulted in finds of "severed heads"; their interpretation remained uncertain but the representation of a hand over the skull in some cases would appear to imply a protective symbolism. Other pieces appeared to be related to the practice of collecting the heads of enemies; a bas relief showing a warrior on horseback was interpreted as riding to the region of the dead.

An interesting and potentially important event took place when the Royal Anthropological institute launched an appeal for the establishment, as soon as possible, of a Museum of English Life and Traditions. The appeal resulted from the institute's appointment of a committee called the British Ethnography committee, charged with examining and recommending on means of promoting the study of the ethnography of Great Britain. A Museum of English Life and Traditions was the committee's first recommendation; a scheme was drawn up and published and the movement started; it was proposed to proceed first by trying to find storage for specimens, already rapidly disappearing, and then eventually to establish, in some large house with grounds, a museum with facilities for showing typical English village lay-outs. The plan was explained to the 1949 meeting of the British Association by the committee's deputy chairman, T. W. Bagshawe, who urged the need for quick action before too much was lost. It was also reported that the committee had nearly completed a collection of rules for classifying and indexing specimens and records. The museum scheme was fully described in Man, April 1949.

The Colonial Month, organized by the British Colonial Office, was of interest to anthropologists as it brought about a small but important exhibition of the traditional art of the British colonies, held at the Royal Anthropological institute. The bronze heads of Ile and the Nigerian terra cotta heads were outstanding pieces in the exhibition, which contained many other specimens not before shown or published. Also as a contribution to the Colonial Month, the subject of anthropology and colonial affairs was discussed at a public meeting of the Royal Anthropological institute, when the principal speakers were Professor E. E. Evans-Pritchard (who succeeded Professor C. D. Forde as president of the institute) and Professor R. Firth. A chair of social anthropology was established at Manchester university and Dr. H. M. Gluckman appointed the first professor. The institute's annual Huxley Memorial medal was awarded to James Hornell, distinguished for his work on water transport; his death before the delivery of the Huxley Memorial lecture was deeply regretted.

The British Association held its annual meeting at Newcastle-upon-Tyne under the presidency of Sir John Russell (q.v.). Outstanding among the many subjects discussed was the relationship between food and population. The problem set was that of producing to meet the needs of a world population of 2,200 million increasing at the rate of 20 million a year; the need of such a mass could be met only by correlating the efforts of science in all branches; production must be increased but natural resources, already much impaired, must at the same time be restored; the balance of nature must be preserved and a symbiosis achieved between man and his environment. In the section for anthropology and archaeology, Miles C. Burkitt, the president, spoke of the value of archaeology in education.

The anthropological structure of Poland was the subject of a report by Ireneusz Michalski in Acta Anthropologica Upsaliensis. This dealt with specimens of 36,532 men collected through the Polish War Office and studied in relation to the types visualized by Professor Jan Czekanowski. The 16 maps in part two summarized some results. They showed that, though Nordic traits are generally distributed, they are specially characteristic near the lower Vistula, accompanied by darker elements described as Cromagnonoid (broadfaced and tall) and Mediterranean (narrowfaced and short). On the other hand, elements described as Armenoid, Laponoid, Subarctic and Dinaric (broadheaded in all cases) are most characteristic of Upper Silesia, the Cracow area and the country north-eastwards towards Radom.

An event of the year was the appearance of Dr. R. N. Salaman's book on The History and Social Influence of the Potato (Cambridge, 1949). He traced the tuber back to an Andean home and gave many clues to the social anthropology of European peoples who acquired it, a deep difference arising from the imposition of almost complete dependence in some cases and the utilization of the potato with some freedom of choice and as an accessory in others. Dr. Salaman summed up here a large part of the work of many years. Abbé Henri Breuil described in preliminary fashion a rock painting in Southern Rhodesia at Chikwando. Its importance was due to the fact that the profile of the man was Semitic rather than African and the eye almost almond-shaped. Non-African figures were seen on a few rocks in Southern Rhodesia and this confirmation would, it was hoped, lead to an interpretation of what at first glance seemed like a link with Egypt of the centuries before Islam. In Social Structure (Oxford, 1949) a group of social anthropologists under the editorship of Dr. M. Fortes paid tribute to the life-work of Professor A. R. Radcliffe-Brown. Kinship structure was exhaustively treated by Dr. C. LéviStrauss in Les Structures élémentaires de la parenté (Paris, 1949). African race problems were surveyed in Handbook of Race Relations in South Africa (edited by E. Hellman, Oxford, 1949). The Rev. W. Schmidt produced another volume, the ninth, of his massive work, Der Ursprung der Gottesidee (Freiburg, 1949); this part dealt with Asiatic pastoral nomads. Professor E. O. James issued several volumes in the series of world religions which he was editing. (H. J. F.; F. Sr.)

United States. The steady growth of anthropology continued during 1949. This was shown especially by the large number of important publications that appeared during the year, by the growth of anthropology departments in the universities and by the expansion of field studies and various international activities. In the United States there was a large increase in membership of the American Anthropological association. The impressive growth in size and influence of this organization was due in large part to the efforts of its first executive secretary, Erminie Voegelin.

The 19th session of the International Congress of Americanists, held at the American Museum of Natural History in New York from Sept. 5 to 12, was attended by 395 anthropologists from Europe and the western hemisphere. Over 200 papers were presented and symposia were held on the subjects of early man in America, comparative studies in Peru, middle American and Andean relations, origin and relationships of the Eskimo, population in native America, language and culture, Afro-American studies, and modern Indian, mixed and Creole cultures. A special exhibit at the museum demonstrated striking parallels in art and material culture between America and the far east and raised anew the question of trans-Pacific influences in western America, something which most North American anthropologists had hitherto rejected.

Anthropological problems and the need for research programmes for the Pacific area were among the subjects discussed at the 7th Pacific Science congress which convened in Auckland and Christchurch, New Zealand, in February and March 1949.
The American Association of Physical Anthropologists began a new series, Studies in Physical Anthropology, under the editorship of W. W. Howells, the first number being a symposium, Early Man in the Far East, with papers on various aspects of Pleistocene geology, archeology, paleontology and somatology.

Two volumes bearing the title Social Structure appeared in 1949. One was a collection of essays edited by Meyer Fortes and presented to Professor A. R. Radcliffe-Brown by 11 of his pupils and colleagues. The other was a volume by G. P. Murdock. Basing his postulates on an analysis of 250 societies in all parts of the world, Professor Murdock presented a new theory of the evolution of social organization and showed for the first time that human and social behaviour could be analysed and predicted with a precision comparable to that in the exact sciences. Another paper was Julian H. Steward's Cultural Causality and Law: a Trial Formulation of the Development of Early Civilizations. In this paper, published in the American Anthropologist, Steward showed that there had been parallel stages or eras, each with similar diagnostic features, in the development of early civilization in northern Peru, middle America, Mesopotamia, Egypt and China. Leslie A. White's series of papers on the evolution of culture, which had a profound influence on anthropological thinking in the past, were assembled in a volume The Science of Culture: a Study of Man and Civilization.

An unusually large number of important descriptive works in ethnography were published in 1949. Among these were The Bella Coola Indians, by T. F. McElwraith; The Comparative Ethnology of South American Indians, vol. 5 of the Handbook of South American Indians, edited by Julian H. Steward; The Lapps, by Bjorn Collinder; Paluan Society, a Study of Contemporary Native Life in the Palau Islands, by Homer G. Barnett; Majuro, a Village in the Marshall Islands, by Alexander Spooehr; Culture and Ethos of Kaska Society, by John J. Honigmann; The Bantu of Northern Kaviordo, by Gunter Wagner; The Tenetehara Indians of Brazil, by Charles Wagley and Eduardo Galvão.

Other important publications of the year were History of the Primates: An Introduction to the Study of Fossil Man, by W. E. Le Gros Clark; External Morphology of the Primate Brain, by Cornelius J. Connolly; T’epexpan Man, by Hellmut de Terra, Janier Romero and T. D. Stewart; The Web of Kinship among the Tallensi, by Meyer Fortes; Social Class in America, by W. Lloyd Warner; Magic, a Sociological Study, by Hurton Webster; Male and Female, by Margaret Mead; General Anthropology and Primitive War, Its Practice and Concepts, by H. H. Turney-High; Law and Government of the Grand River Iroquois by John A. Noon; and The Social and Religious Life of a Guatemalan Village, by Charles Wagley.

There was a marked increase in field investigations during 1949. F. Eggun, chairman of the Department of Anthropology, University of Chicago, began a survey of social organization and culture in the mountain provinces of Mindanao and Visayan islands in the Philippines. Another Philippine research project was that of Grace L. Wood, who undertook ethnological studies among the Negritos and other primitive groups on Negros Island.

W. C. Pei of the Cenozoic Research laboratory, Peking Union Medical college, resumed excavations at Chou Kou Tien in search for further remains of Peking Man.

David G. Mandelbaum, professor of anthropology at the University of California, returned to southern India to resume ethnological work with the Kota people in the Nilgiri area. Morris E. Opler also undertook research on village life in India. Alexander Spooehr began a year's programme of anthropological research for the Chicago Natural History museum on Saipan and the other Marianas Islands. His programme included a study of cultural change among the native Chamorros and archaeological excavations to determine how the islands were originally peopled. The Pacific Science board of the National Research council continued its Micronesian investigations, with I. Dyen studying linguistics on Yap, and Ann Meredith making a study of the socialization process in the Truk area.

The Aleutian expedition of the Peabody museum of Harvard directed by William S. Laughlin, continued its archaeological, anthropological and linguistic investigations on Umnak and islands to the westward. Frederica de Laguna began an ethnological and archeological survey of the northern Tlingit country in southeastern Alaska as part of an integrated study of the origin and development of Tlingit culture. A notable accomplishment in the field of Arctic anthropology was the independent discovery of pre-Eskimo cultural remains by J. L. Giddings at Cape Denbigh on Norton sound, by Helge Larsen in the interior of Seward peninsula and by Ralph Solecki on the north slope of the Brooks range in the interior of northern Alaska. Information on the distribution and movements of pre-historic Eskimo population in the little known northern part of the Canadian Arctic archipelago was obtained by H. B. Collins' excavation of old village sites on Cornwallis Island.

A new Department of Anthropology was established at Rutgers university, New Brunswick, New Jersey, with M. F. Ashley Montagou as chairman. Anthropology courses were offered for the first time at a number of other U.S. universities and colleges, including the Universities of Alabama, Mississippi, Arkansas, Virginia, Louisville, and Florida State university.

Two prominent anthropologists who died during the year were J. M. Cooper and L. Bloomfield. (H. B. C.)

**ANTIGUA:** see Leeward Islands.

**ARABIA.** A peninsula of Asia of approximately 1,027,300 sq. mi. with a total population estimated at 9,526,000. It consists politically of two independent Arab states, Saudi Arabia and Yemen (q.v.); the independent sultanates of Oman and Masqat or Muscat; the autonomous sheikhdoms of Bahrein, Kuwait, Qatar, and the Trucial sheikhdoms; and Aden colony and protectorates (q.v.). Religion: overwhelmingly Moslem (Sunni). Language: Arabic. Saudi Arabia. Area: c. 597,000 sq. mi. (excluding the Rub al-Khali desert covering approximately 193,000 sq. mi.); pop. (mid-1947 est.): 6,000,000. Chief towns: Riyadh (cap., 60,000); Mecca (150,000); Median (45,000); Jedda (40,000); Hufuf (1,510). Ruler, King Abdulaziz Ibn Abdurrahman Ibn Faisal Ibn Sa'ud; viceroy of Nejd and commander in chief, Emir Sa'ud, crown prince; viceroy of Hejaz and minister of foreign affairs, Emir Faisal.

History. The United States and Saudi Arabia announced on Jan. 21 that they had agreed to raise the status of their respective missions to the rank of embassies. On presenting his letters of credence as ambassador to President Truman on March 4 Sheikh Asad al-Faqih revealed that the American community in Saudi Arabia numbered 5,000. This, he said, was a remarkable development which was accompanied by a
rapid growth of mutual interest and which had become of great importance not only to the general welfare of the two peoples but also to the peace and prosperity of Europe and the rest of the world. Although he could not say that during his three years as minister in the U.S. the Arab cause had fared well, he was convinced that the American people would in due course realize its genuine aspects. The U.S. aircraft carrier "Tarawa" paid a goodwill visit to Jeddah in January. The agreement with the U.S. regarding the use of Dahran air base was extended temporarily on March 15 pending final negotiations.

The economic development of the country continued. Oil production during Jan.-July 1949 averaged over two million metric tons a month (not far short of that of Persia). On this the Saudi government received royalties at the rate of $50-60 million yearly. On March 4 it was announced that a U.S. company, the Pacific Western Oil corporation, had obtained an oil concession covering Saudi Arabia's undivided half interest in the Kuwait-Saudi neutral zone. A first year's minimum royalty of $1 million was paid over on Feb. 21.

A large number of American and some British engineers and specialists, together with skilled men from Moslem countries, were employed on public works, including rail and port construction, roadmaking, an electricity installation in Mecca and a broadcasting transmitter at Jedda.

The British Military mission, established in 1947, continued the training of Saudi officers and N.C.Os. Steps were taken, too, to buy from the U.S. some light naval craft for coastal patrol work; and the Egyptian government was asked to provide a naval mission to train officers and crews. Egypt was also asked in May to assist in forming a customs administration and in August to lend some professors to act as educational inspectors.

A trade treaty with Egypt, valid for one year, was signed in Cairo on May 31. It was on the basis of most favoured nation treatment and had annexed to it a payments agreement. It provided, too, for a permanent exhibition of Egyptian products at Jedda.

Prince Mansur, ninth son of the King and minister of defence, visited Great Britain for the first time in September and was taken to see army and air force training establishments. In Arab League politics King Ibn Sa'ud generally supported Egypt.

**Arab League**

The League of Arab States came into being on March 22, 1945, when its covenant was signed in Cairo by the representatives of Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Transjordan and Yemen. The council of the league, on which each member has one vote, has its seat in Cairo. The main object of the League was stated to be to co-ordinate the political action and safeguard the independence and sovereignty of the Arab states. Secretary general: Abdurrahman Azzam Pasha.

The Palestine conflict and the problem of the Arab refugees continued to preoccupy the league in 1949. It was however much weakened by differences among its member states. Representatives of all member states except Jordan met in Cairo on Feb. 6 to discuss the invitation of Dr. R. J. Bunche (q.v.), United Nations mediator, to join Egypt in the armistice negotiation with Israel at Rhodes. The U.N. Conciliation commission was received in Cairo on Feb. 14 by the secretary general. In the upshot the armistice agreement was signed on Feb. 24 by Egypt alone; Jordan, Syria and Lebanon each negotiated separately, and Iraq and Saudi Arabia declared themselves ready to accept any agreement signed by the other Arab states.

At the 10th session of the council, held in Cairo on March 17-21, the members were represented by their diplomatic representatives in Egypt. The secretary general told the press that Iraq (q.v.) had not sent any apology or explanation for the non-attendance of its representative. No proceedings of importance were reported.

The political committee on March 21 began discussions on Palestine and the Arab refugees with the U.N. Conciliation commission in Beirut. Discussions were closed on April 5, after the commission's suggestion to continue negotiations as soon as a neutral place had been accepted by all the delegates except that of Iraq who said his government were disinclined to continue discussions before the refugee problem had been solved. The place subsequently chosen was Lausanne, where a conference, attended also by Israel, began on April 27 and continued with adjournments during the year; an Economic Survey group being appointed to study the question of the Arab refugees on the spot.

Events in Syria (q.v.) much aggravated the differences among the member states. The secretary general, who had visited Husni ez-Zaim in Damascus on April 17, on May 8 called for an urgent meeting of the council so that he might answer the charges made against him by the Iraqi foreign minister of having exceeded his jurisdiction. On May 23 a statement addressed by Azzam Pasha, to the president of the Iraqi Chamber of Deputies was published. It said that he had taken no steps, taken part in no activities and approved no measures other than those unanimously authorized by the League council.

Despite persistent efforts in many quarters and particularly by the prime minister of Lebanon (q.v.) a further meeting of the political committee could not be arranged. One arranged for Aug. 20 at Alexandria was adjourned at Egypt's request owing to events in Syria. The council did however hold a meeting in Cairo on Oct. 17 where it was unanimously decided to support the Egyptian delegate to U.N. in his attitude on the future of Eritrea. The meeting ended on Oct. 30 with a decision to set up a committee to draft a security pact between the seven member states. (C. Ho.)
ARAGON, LOUIS. French writer (b. 1897), served in the last year of World War I. Two years later his first book of poems, Feu de joie, appeared and was followed by Le Libérinage (1924) and Le paysan de Paris (1926). He was among the advance guard of the Surrealist movement until in 1930, he became a member of the Communist party and visited Russia. His change of political views found expression in such poems as Front Rouge (1931), for which he was prosecuted on a charge of having abused the French flag. He became secretary of the French section of the popular front, a member of the editorial staff of L’Humanité, then managing editor of Ce Soir and later also joined the board of directors of Europe. A week before the outbreak of war in 1939 Ce Soir was temporarily suppressed. Aragon joined a tank division and later took part in the resistance movement. After the war he continued to engage in literary and journalistic activity and resumed the editorship of Ce Soir. In Sept. 1949 he was charged with having menaced public order and was deprived of his civil rights as the result of an article which had appeared in Ce Soir. On Oct. 26, however as the result of an appeal he was acquitted and the sentence was quashed.

Aragon was awarded the Prix Renaudot in 1936 for his novel Les Beaux Quartiers, the second of a trilogy of which the other two were: Les Cloches de Bâle (1934) and Les Voyageurs de l’Impérial (1941). He afterwards published, among other works, two volumes of poetry, Le Crève-Cœur (1941) and Les yeux d’Elsa (1942), and a novel, Aurélien (1945). He married Elsa Triolet, a Russian writer to whom many of his works are dedicated.

ARCHAEOLOGY. In 1949 the story of the discovery and the investigation of the Hebrew scrolls from the Dead sea cave probably attracted most attention. Among the more important events were the further examination of Karatepe, Turkey; the palaeolithic cave-finds in France; the Maglemosian site in Yorkshire; and the recognition of the south Algerian limes.

Great Britain. Further exploration of the stone-axe factory site at Pike o’ Stickle, Great Langdale, Westmorland, confirmed that the finishing processes were carried out at a lower altitude. A small cave in the area proved disappointing. Products of this factory were apparently traded more widely in Britain than those of the better-known Craig Lwyd site in North Wales (Trans. Cumberland and Westmorland A. and A. Soc. 48, 214, 1949).

At Storr Carr, Seamer, six miles south of Scarborough, Dr. J. D. G. Clark excavated for the Prehistoric society a Maglemosian site of c. 8000-6000 B.C., discovered by J. W. Moore, and found strikingly abundant evidence for conditions of life in Mesolithic Britain, the peaty nature of the site having preserved large quantities of organic material. There were even structural remains in the form of rough birch-bark flooring held down by heavy stones. Bones were found of red and roe deer, elk and ox, as well as smaller animals and birds. Red deer antlers were used for making barbed points ("harpoons"), of which 60 were found; the cutting was done withburns knapped on the spot. Other implements or weapons were: scrapers, microliths and rough stone axes; an axe made from the base of an elk antler; scoops and chisels of red deer antler. There were also well preserved birch-bark rolls. The site proved to be closely linked with its counterparts across the North sea and comparable with them in importance.

In the Scilly Islands B. H. St. J. O’Neill and his wife continued their work and excavated a Bronze Age house at English Island Cairn. Roughly oval in plan, it had three occupation layers, from the middle one of which came potsherds assigned to c. 1000 B.C. At a nearby site, Par Beach, they examined a well built round house of native construction associated with the 4th-century Roman pottery.

At Meare lake village, Somerset, H. St. George Gray examined three dwelling-mounds. Among numerous bronzes, which included ornamented cheek-pieces, was a spoon of Roman type probably imported from the continent towards the end of the Early Iron Age.
At Sn'titcham, Norfolk, late in 1948 three Iron Age hoards were found, with interesting affinities with the Rhineland. One consisted of fragments of at least three gold torcs; the others were mainly of bronze and included 3 torcs, 7 bracelets, 11 rings and various fragments; the third hoard also contained 77 coins.

In Roman studies the main event of the year was the centenary pilgrimage along Hadrian's Wall, which provided an opportunity for re-stating the latest views on the main Roman frontier in Britain. It was shown that the Wall, with its milecastles, turrets and vallum, formed a single conception, carried out in A.D. 122-126. From Newcastle to the Irlwth (45 mi.) it was designed 10 Roman feet thick with a clay or earth core. West of the Irlwth, in view of the shortage of stone and especially of limestone for mortar, the Wall was of turf or clay. Before the stone wall was completed, however, its construction was modified: its western part was finished to a width of only 8 ft. with a mortar core; it was extended eastwards to Wallsend and westwards for a further two mi.; finally the whole line was strengthened by the introduction of forts, each intended to hold 500 or 1,000 auxiliary troops. The change of military policy under Antoninus Pius led to the construction of a new frontier barrier between the rivers Forth and Clyde and consequently the virtual abandonment of Hadrian's Wall—an event with which the well-known "crossings" of the vallum might be associated, if, as it was suggested, they represented a formal cancellation of that earthwork. Later in the century, however, the Wall was re-occupied and its west end reconstructed in stone. Views held on the later history of the frontier showed less modification since the 1930 pilgrimage, but the extent of the Dioecetian reconstruction received increased attention. The pilgrimage was succeeded by a Congress of Frontier Studies, attended by scholars from many parts of the Roman empire and organized by Durham university. This was to become a quinquennial event.

Near Carrawburgh fort a well preserved mithraeum was partly excavated and three inscribed altars found. At Bewcastle, Cumberland, the regimental bath house was found to have been inside the fort; it also was well preserved and resembled the bath house at Chester in plan. Dr. J. A. Richmond excavated the central portion of the fort at South Shields, Co. Durham, uncovering a large group of granaries associated with the Scottish campaigns of Severus. Other work on Roman military sites included the excavation at Malton, Yorks., of a building, possibly a mansio, with hypocaust and mosaic floor, south of the fort; a fort gateway with flanking guard-chambers at Neath, Glamorgan, where the earliest (Flavian) finds were associated by Dr. V. E. Nash-Williams with the conquest of the Silures by Julius Frontinus; and the remains of the legionary fortress at Chester.

The study of Roman towns, especially in bombarded areas, continued. In London the Roman and Mediaeval Excavation Council located an early 2nd-century town wall with clay backing; it was superseded about the middle of the century or a little later by similar composite defences on an inner line; to this wall hollow bastions were added during the 4th century. Bombard sites in Canterbury, excavated by S. Frere, produced evidence for the Roman street-plan; it is possible that the 1st-century plan was modified when the town walls were built in the 2nd century. A large bath-building of semi-public character was uncovered. At Verulamium (St. Albans) the centre of the Roman city was examined and a large public building of massive construction found.

Of other discoveries the most striking was that at Lullingstone, near Farningham, Kent, where a wealthy villa produced a mosaic pavement depicting Bellerophon upon Pegasus and a Rape of Europa with a somewhat provincial couplet, both ascribed to about A.D. 300. Most remarkable were two busts of Pentelic marble probably of early 2nd-century date. Another villa, of corridor type, excavated at Whittington Court, Gloucestershire, retained its geometric mosaics and channelled hypocausts of 4th-century date. A pottery kiln excavated near Lincoln produced a complete range of "kiln furniture." Later sites included Petersfingher, near Salisbury, where a 6th-century Saxon cemetery was found to contain Frankish elements: The Mounts, Pachesham, near Leatherhead, Surrey, the site of successive manor houses abandoned towards the end of the Middle Ages; and, most important, the London Charterhouse of which the great church, with burial place of the founder, and the cloister had been traced by the London Excavation council.

Europe. France. Professor D. A. E. Garrod reported an important find by Mlle. G. Henri-Martin of fragments of two skulls in a cave at Fontéchevaide, near Montbron, Charente, with rough flint implements of Tayacian character. The larger skull was comparable to that from Swanscombe. Despite certain primitive features it stands in the same line of descent as Homo Sapiens and has indeed a very high forehead. Prof. Garrod pointed out that the contrast between the rough implements from Fontéchevaide and the well-made implements (mid-Acheulian) found with the Swanscombe man accorded ill with the "seductive theory that links certain well defined industrial complexes with certain human types." She also reported that her excavations (with Mlle. S. Mathurin) of the prehistoric rock-shelter at Angles-sur-l'Anglin, Vienne, produced a naturalistic representation of a Paleolithic (Early Magdalenian) man, executed in stone in a technique combining sculpture, painting and engraving. Among several animal carvings that of a young ibex was noteworthy.

At La Colombière, on the banks of the Aun, 45 mi. from Lyons, Dr. K. Bryan and Dr. H. L. Movius, of the Peabody Museum, Harvard, examined the late Pleistocene terraces, which were found to belong to Wurm times, and a rock-shelter associated with them. In addition to a decorated bone object of Magdalenian date and upper Aurignacian tools, the main find was an engraved pebble bearing superimposed animal outlines depicting horse, reindeer, ibex and woolly rhinoceros.

 Finds made during work in war-damaged towns included quantities of 6th-century B.C. Greek pottery at Marseilles, among which was a figure of Aphrodite; and a bronze vessel from Amiens, similar to the "Rudge cup" and to a fragmentary example from Spain. Like the "Rudge cup" it is inscribed with the names of forts on Hadrian's Wall, with the additional name of Aesica (Great Chesters).

Germany. Excavations in bombed areas took place at Trier and Cologne, producing details of the Roman city and of what was thought to be remains of a monastery of the St. Gall type and period respectively.

Denmark. G. Hatt published a survey of ancient field systems in Denmark (Oldtidsskrig, Copenhagen, 1949). They were mainly early Iron Age in date and were eventually superseded by the heavy plough and strip-field system. Comparative material, especially from Holland and England, was included in the survey.

Italy. Alba Fucens, the stronghold of the Aequi, situated near Avezzano (Abruzzi) on the Via Valeria was partly excavated. Part of the city plan and of the Via Valeria were explored, the finds including inscriptions and terra-cottas.

Greece. The American School of Classical Studies at Athens reported about its work in the Agora, in particular the excavation of a fountain house, which may be the Ennea-kronos, in the southwest corner of the market square and excavations in the valley west of the Areeagus, where a
rich cremation-burial of c. 900 B.C. and a group of 5th-century B.C. houses were found (Hesperia, 18, 1949). In the same volume S. S. Weinburg recorded small-scale work by the American school at Corinth, where the theatre, south stoa, and the Julian and south basilicas were tested. The two latters were found to be identical in plan.

**Middle East.** Cyprus. Dr. Claude F. A. Schaeffer, director of the French Centre of Scientific Research, Paris, reported his discovery of the ancient city associated with the previously known Mycenaean cemetery at Enkomi, near Famagusta, and identified it, through the Tell Amarna letters, with Alasia, the ancient capital of the island, a centre of the copper and bronze industry. The earliest remains dated from the beginning of the second millennium B.C. Later came the Mycenaean city, covering the 15th-13th centuries B.C., during which time the city was strongly fortified; and lastly a post-Mycenaean period of 13th-12th centuries B.C. Subsequent work by the Cyprus Department of Antiquities under Dr. P. Dikaios produced, from what may have been a shrine in an impressive palace building, a remarkable bronze statue, two feet high, of a horned god, deposited in the 12th or 11th century B.C.

**Turkey.** Professor H. Th. Bossert, director of the Department of Near Eastern Studies, University of Istanbul, and his colleagues (Dr. Halet Cambel, Dr. Bahadir Alkim, Dr. Nihal Ongunso, Dr. Franz Steinherr, Dr. Muhibbe Darga-Anstock and Ibrahim Szen) reported about their further work at the two Hittite fortresses of Karatepe and Domuztepe, bordering the Cilician plain, on both sides of the river Ceyham (ancient Pyramos). At Karatepe the surrounding wall, which had square interval-towers, had north and south entrances with long gate-passages flanked by inscribed and sculptured slabs. The inscriptions are half in Old Phenician and half in Hittite hieroglyphic script and, since they apparently record the same events, constitute a series of “Rosetta stones.” They are dated c. 730 and their deciphering should fill a great gap in the history of the region. The slabs bearing figure subjects were apparently carved in situ; the figures, generally in profile, vary greatly in subject matter, including religious or mythological scenes and scenes from the life of the royal family or the people—banqueting and hunting scenes, warriors and ships. Artistically and iconographically Egypt, Mesopotamia, Anatolia and Syria had all been laid under contribution. (Belleten, 12, 529, Ankara, 1948; Palestine Explor. Qy., Jan.-April, 1949; Oriens, 1, no. 2, Leiden, Holland, 1945-49).

Professor A. W. Persson reported discovering at Labranda, 9 mi. north of Milas (ancient Mylissa) and about 85 mi. S.S.E. of Izmir ( Smyrna), a peripteral temple of Zeus like that of Athena Pollias at Pirene. Epigraphic finds included building-inscriptions of Maussollos (d. 353 B.C.) and Irideus (d. 344 B.C.) and clay tablets bearing partly a script of Carian character and partly one related to Old Phenician and Minoan scripts. (Archeologica, Upsalia, Sweden, 1949).

**Palestine.** Fuller details became available of the discovery and nature of the Hebrew scrolls, found in a cave on the shores of the Dead Sea about 6 mi. south of Jericho, and the vexed question of the approximate date of their deposit was settled by an excavation carried out by G. L. Harding, chief curator of antiquities, Jordan, in collaboration with the Ecole Biblique et Archéologique de Jerusalem and the Palestine Archaeological museum. The scrolls, wrapped in linen squares, were stored in large, lidded jars of the late 2nd or early 1st century B.C. The jars, to judge by the fragments, were about 40 in number and could each have held five or six scrolls. Of the eight known to have been removed by the goatherd finders, four, now in the United States, comprise Isaiah, a commentary on Habakkuk, a book of ritual (the Sectarian Document) and part of Enoch in Aramaic; the other four, now at the Hebrew university of Jerusalem, The War Between the Children of Light and the Children of Darkness (an unknown apocryphal book), part of Isaiah, a book of hymns and psalms and one not yet read. Harding’s clearance of the cave produced many fragments which included portions of Genesis, Deuteronomy, Leviticus, Judges and Daniel. The lined documents are written mainly in post-Exilic script, but some, in Phenician script, are probably earlier. It is possible that the presumed absence of many scrolls may be associated with the find of Hebrew scrolls in A.D. 27, recorded by the 3rd-century writer Origen.

The end was reported (Palestine Explor. Qy., Jan.-Apr., 1949) of several years’ work on the great Umayyad baths (c. A.D. 724-743) at Khirbet Maﬁsar, near Jericho. The main structure (135 ft. by 110 ft.) had a colonnaded hall 90 ft. square; the roof, supported by 16 piers, 6 ft. square with angle-shafts, probably rose by stages to a high dome over the central bay. Each wall had three semi-circular exedrae, except the east wall, where the central bay contained the entrance; this led to an elaborate porch, a domed structure decorated with male and female statues. The central exedra of the west wall was more richly decorated than the others. The central three bays of the south side of the hall were occupied by a swimming-bath. The paving was well preserved and there were many architectural fragments. Doorways in the north wall led to a series of hot rooms and to a domed room, elaborately decorated with mosaic paving and carved plasterwork.

Discoveries under the ægis of the government of Israel included a Samaritan synagogue of Hellenistic times near Tel Aviv; mosaic pavements in Jerusalem; prehistoric finds at Evron, between Acre and Naharia; and Hellenistic marbles from Cäsarea, Nahantia and Tivon.

**Persia.** T. Burton Brown, research fellow of the British School of Archaeology in Iraq, reported on the British expedition to northwest Persia, which carried out trial excavations at Geoy Tepe, 4 mi. southeast of Rezaieh (Urmia). The earliest levels produced remains like the al Ubaid culture of Iraq (c. 3000 B.C.). Later levels showed instructive affinities with near eastern and especially Aegean civilization, of the first three millenia B.C. and included a remarkable series of stone figures with unknown hieroglyphs.

**Iraq.** Work continued on the pre-Hammurabic administrative centre at Tell Abu Harmal, near Baghdad. The plan of the interior was completed and further inscribed tablets found, some from early levels. At Tell Abu Shahrein (ancient Eridu) further excavation revealed a large public building of brick
with fragments of Sumerian sculpture similar to that at the contemporary “A” palace at Kish.

**Africa. Egypt.** In Alexandria recent excavations directed by Alan Rowe, curator of the Greco-Roman museum in that city, located the temple of Serapis, now assignable to Ptolemy III (241-221 B.C.), near the column of Diocletian. It formed the north end of a colonnaded enclosure 560 ft. by 250 ft. wide, with accommodation on the west for temple officials and, to the south, a series of small rooms which were thought to have contained the Serapeum library. The temple was rebuilt early in the 2nd century B.C. and was destroyed by the Patriarch Theophilius in A.D. 391. East of the temple was a shrine of Harpocrates dedicated by Ptolemy IV (221-203 B.C.).

At Thebes an avenue of monolithic sphinxes, with portrait heads of Nectanebis I and dedicated by him to Amon, was found under a Roman pavement.

**Sudan.** The excavation of Amarah was continued and results pointed to peaceful excavation of the city in late Ramssid times, probably for climatic or political reasons. A brick-built shrine outside the town was evidently the centre of a snake cult for it was surrounded by pots containing skeletons of snakes.

**Tripolitania.** The examination of Sabratha, 45 mi. west of Tripoli, was continued by Dr. J. B. Ward-Perkins and Miriam Kenyon. Sabratha owed its wealth to olive oil exports and the general trade of the north African hinterland. It was given colonial status in the 2nd century A.D., survived, though not undamaged, successive barbarian invasions and was reconstructed by Justinian. Some traces of the earlier Punic city were found but work was concentrated on the survey of the remains and the study of their history and development. Buildings examined included the basilica (later a Christian church) and forum; buildings associated with the latter were a curia, a capitolium and temples to Liber Pater and Serapis. The same workers planned and recorded the 4th-century “hunting baths” (so-called from their scheme of decoration) at Leptis Magna.

**Algeria.** An air survey produced the important information that substantial remains survived in southern Algeria of a Roman town. Its complexity ranks it with, though after, Hadrian’s Wall. (J. Baradez, "Vue aérienne de l’organisation romaine dans le Sud-Algérien," Fossatum Africæ, Paris, 1949).

**BIBLIOGRAPHY.** War and Archaeology in Britain (London, H.M.S.O., 1949).

**Western Hemisphere.** Although there were substantial gains in knowledge of the archaeology of the western hemisphere during 1949, the most outstanding event was a demonstration of a system of absolute dating of certain kinds of archaeological remains by means of the radioactivity of the carbon isotope (C14). The new method, archæo-radiocarbon chemistry, was developed by Dr. W. F. Libby and Dr. James Arnold of the University of Chicago. By measuring the radioactivity of the carbon isotope in wood, charcoal, shell, horn, ivory and vegetal remains found in ancient archaeological sites, the age of the site could be determined with a remarkable degree of accuracy. An impressive number of sites in the western hemisphere were dated by the radiocarbon method and the results would probably be released in 1950.

**Arctic Area.** Under the auspices of the Smithsonian institution and the National Museum of Canada Dr. Henry B. Collins assisted by J. P. Michea excavated a number of ancient Eskimo sites on Resolute bay, Cornwallis island in the hitherto archeologically unknown Canadian arctic archipelago. Ruins of four villages of from 6 to 14 well preserved houses of Thule culture type were excavated. Over 1,000 characteristic Thule artifacts were excavated from the houses and middens. A number of fine examples of pictographic art were obtained as well as a style of composite pottery and stone lamp previously unknown. The excavations revealed that bow head whales and drift wood were abundant at the time of the Thule occupancy although they have been absent from the region in modern times.

A joint expedition of the Danish National museum and the University of Pennsylvania museum conducted archeological investigations on several sites on the Seaward peninsula in Alaska during the summer. The expedition was led by Dr. Helge Larsen assisted by Charles Lucier. A previously unknown phase of Ipiutak culture was found beneath a late Eskimo village midden at Cape Spencer. Iron knife blades and elaborate carvings of ivory were found in the Ipiutak levels. Two sites were excavated at the Deering airfield. One of these sites was western Thule, the other was Ipiutak with artifacts identical to those of the type site at Point Hope. In a limestone cave 30 mi. from Deering, stratified deposits revealed a sequence from what may have been pre-Eskimo culture to recent Eskimo culture in the uppermost levels.

During the summer, with a grant from the Arctic Institute of North America, Dr. Louis Giddings of the University of Alaska continued his excavations at Nukleet and Iyatayet on Cape Denbigh in Norton sound, Alaska. He was assisted by Mr. and Mrs. Wendell Oswalt. Excavations at Nukleet were carried through the permafrost to bedrock revealing several stages of Eskimo culture. The oldest level showed relations with Early Punuk or Birnirk cultures. Quantities of well preserved artifacts made of organic materials were found.

At Iyatayet the upper layers contained artifacts similar to those found at Nukleet. In the lower levels Ipiutak-like artifacts of flint were found. And underneath the site, sealed by a sterile layer of sandy clay was a thin, bottom deposit containing nearly a thousand chipped stone artifacts. Included

*Exploration at Lincoln, Nebraska, where dwellings 5,000 years old were discovered by E. Mott Davis.*
in the lithic complex were burins and lamellars of styles known from the Old World and additional types of artifacts known from Folsom or Yuma horizons in the western states. With the Folsom and Yuma-like materials was a fluted point and a broken blade of the type known as "oblique Yuma."

As part of the Harvard university anthropological project in the Aleutian Islands during the summer, archaeological investigations were undertaken under the direction of Dr. William Laughlin. Excavations were made at sites on Clam lagoon, Adak; at Nikol ski on Umnak; and at Nurder point on Attu. At least two periods of Aulet culture were recognized and Hrdlicka's idea that there were two morphological types involved in the peopling of the Aleutians was confirmed.

**Eastern North America.** Under the direction of Raymond Baby assisted by Robert Goshin an Ohio State museum field party excavated two sites in Ohio during the summer. A large Adena mound in the Cowan Creek reservoir area contained 18 burials, some in log tombs and one in an underground pit. Beneath the mound was a circular house pattern of paired post moulds; pottery, other artifacts and food refuse were about the house. In the Delaware dam area a communal burial in a glacial kame was excavated. Fragments of charred fabric and artifacts of stone, copper and shell were recovered.

A field party led by Dr. William A. Ritchie worked in eastern New York under the joint sponsorship of the Rochester museum and the New York State museum. The party explored an early Mohawk site in the Schoharie valley where Owasso-like chipped stone artifacts were associated with Mohawk type pottery. In the same valley an early Owasco site was partly excavated; late period Owasco sites were not found. Another and larger early Owasco site was excavated at West St. Johnsville in the Mohawk valley. The pottery exhibited the use of interrupted incising technique for applying decoration. This technique might foreshadow the incising technique of Iroquois potters.

William S. Fowler of the At tleboro museum undertook investigations of two sites in New England. He assisted the Narragansett Archeological Society of New England in completing excavation of a stratified shell midden containing a pre-pottery, steatite bowl occupancy beneath a pottery-agriculture level. At the Nunkatuset site in the Taunton River basin in Massachusetts evidence of three cultural horizons was found: the earliest level marked by ulus, plummets, ground slate objects and grooved stemmed gouges; the middle level marked by steatite bowls; and the top level characterized by pottery.

**Southwestern United States.** The University of Utah Field School of Archeology under the direction of Dr. Jesse D. Jennings made an archeological survey of the upper Virgin river area in Washington county, Utah, and excavated the Jukebox and Danger cave sites near Wendover in Tooele county. The caves contained ancient pre-ceramic cultures overlain by cultures with pottery. The Upper Gila expedition of the Peabody Museum of Archeology and Ethnology, Harvard university, under the direction of Dr. J. O. Brew carried out archeological survey and excavation of sites in west central New Mexico about 40 mi. south and east of Zuni Pueblo. A Pueblo II and a large Pueblo III site were excavated.

**Pacific Coast.** Under the direction of Douglas Osborne assisted by Joel Shiner seven sites in the McNary reservoir of Oregon were investigated for Washington State college and the Smithsonian River Basins survey. Buried middens or the bottom levels of deep middens produced artifacts of basalt and of a different style. A party directed by Clement Mugan undertook excavations in a shell mound at Drakes bay in search of Cau cassin artifacts derived from a Spanish galleon wrecked there in 1595.

Under the direction of Dr. M. R. Harrington a Southwest museum field party carried out excavations in the Pinto Site at Little Lake, Inyo county, California. Two circular houses, the largest 12 ft. in diameter, were outlined by post holes. The site produced many Pinto points and some Lake Mohave and Silver Lake types, along with scrapers, gravers, crude metates and manos.

**Central America.** In Mexico the many archeological activities of the National Museum of Anthropology, the Institute of Anthropology and History and the Direction of Prehispanic Monuments continued. Among the numerous projects of these government institutions were investigations at Teotihuacan and Xochicalco at the middle archeal period site of Tlatilco and clearing and restoration of the Mayan site, Palenque.

The Peabody museum, Harvard university, expedition to Costa Rica, directed by Dr. S. K. Lothrop, made a survey of the southern Pacific plains on lands of the United Fruit company. Testing of stratified deposits revealed three periods of ceramic styles. The early style was reminiscent of Amazon valley pottery and the intermediate style might be ancestral to both classical Chiriqui and classical Cocele.

**South America.** Financed by a grant from the Viking fund and a Cutting fellow-ship from Columbia university Mr. and Mrs. Clifford Evans, Jr., undertook archeological investigations in the lower Amazon basin of Brazil during the first half of the year. Mounds on central Marajo island were excavated. Three mounds of the Monte Carmelo group along the Rio Anajas were investigated and 20 village mounds and one cemetery mound were excavated in the Igarapé Os Camarins in the headwaters of the Rio Anajas. These investigations revealed six separate phases of occupation in the islands of Marajo, Mexiana, and Caviana and two additional phases in the Territory of Amapa.

**ARCHERY.** At the 1949 international tournament, held in Paris in August, the ladies' tournament was won by Barbara Waterhouse (Great Britain), with R. Windahl (Sweden) second, T. H. Fisher (Great Britain) third, and M. de Wharton Burr (Great Britain) fourth. The British ladies won the team events with Sweden second. The men's title was won, for the third time, by Hans Deutgen (Sweden) who beat Hadas (Czechoslovakia); E. Tang Holbek (Denmark) was third. Teams—Czechoslovakia first, Sweden second, Denmark third.

In Great Britain the Grand National Archeity society decided that their national championships should be shot in one direction only, instead of in two directions as was the custom for more than a century. This made possible, on equal terms, a Commonwealth mail match, which was shot, by teams of six, in July. Result: England 7,168 points, Canada 7,123. South Africa and New Zealand also competed. Individual top scores were: W. Frost (Canada) 1,428, R. E. Hunter (South Africa) 1,376, H. A. Hooker (British champion, Portsmouth) 1,299.

The British ladies' national championship was won by B. Waterhouse (Birmingham).

**ARCHITECTURE.** Two ambitious building schemes completed in London during 1949 were blocks of flats at Finsbury and Holborn. The former, designed by the firm of Tecton, comprised three blocks, two of eight storeys containing 48 flats and one of five storeys containing 32 flats. The construction, of reinforced concrete, was based on the box-frame principle of continuous slabs and walls and utilized a new system of hydraulically jacked shuttering, never previously used in this country. The flats were the first in London to be provided with the Garchey system of refuse disposal. Each block was surrounded by a light coloured frame with tiled finish. Details of special interest
in the design were the balcony balustrades, partly solid and partly open, the "sculptured" entrance canopy and the polychromatic prism storeys, as well as the general siting of the buildings.

The Holborn scheme, designed by Robert Hening and Anthony Chitty, included five blocks of flats, one of ten storeys and the rest of five storeys, containing 162 flats in all. Construction was steel frame with hollow tile floors and reinforced concrete flank walls, staircases and cantilevered balconies. Cavity walls were used as panel infillings, the first time this had been permitted for high buildings in London. On the flank walls pre-cast concrete slabs, surfaced with broken brick, were used as permanent shuttering.

The site of the first health centre to be approved by the minister of health was officially opened in March. Designed for the Woodberry Down housing estate, Stoke Newington, by R. H. Matthew, architect to the London County Council, the building would cost £187,000. Five units would be accommodated in the centre, consisting of medical and dental surgeries, school health, child welfare, ante-natal and remedial exercises and child guidance.

Among the most notable schools were those built by the Hertfordshire County Council. During 1947 seven primary schools were completed in the county, at Letchworth, Hitchin, Hemel Hempstead, Oxhey, Bushey, and two at Cheshunt. They were all designed in the county architect's department, under the direction of C. H. Aslin, and employed a standardized system of construction which was intended for use throughout the whole schools' programme of the department. The system was continually being improved in the light of experience gained during construction. It was based on a light steel frame, designed as a series of component parts capable of mass production and easy assembly. The stanchions could be developed in four directions, the longer ones being able to receive beams from the shorter ones on any of their four sides, thus allowing variation in ceiling heights and far greater flexibility in planning. Pre-cast concrete blocks and fibrous plaster covered the frame. The use of colour and the design and placing of windows were carefully considered from the point of view of the child. A secondary school at Stevenage, designed for the Hertfordshire County Council by F. R. S. Yorke, E. Rosenberg and C. Mardall, was officially opened in May. Planned to accommodate 450 children, it included community centres for adults and youths and an assembly hall with stage, to seat 500 people, for the use both of the school and the general public. The construction was steel frame, with components welded into lattice members and galvanized, the framework being planned on a grid of 8 ft. 3 in. Pre-cast concrete slab was used for constructional flooring and roofs, the roof slabs being covered with bituminous material on insulating boarding.

Britain's first permanent prefabricated aluminium school was opened during March. With accommodation for 480 pupils, it was built in approximately nine months, at a cost of £s. 11d. a cu. ft. The system of prefabricated construction was developed by Richard Sheppard and G. Robson, consulting architects to the housing division of the British Aeroplane company. The planning of the school was under the supervision of J. Nelson Meredith, city architect of Bristol.

One of the largest building projects to be completed in Britain during 1949 was a group of buildings for the Bristol Aeroplane company at Filton near Bristol. These buildings included an aircraft assembly hall, together with a canteen, boiler house, workshops, storage buildings and a two-storey block of offices and workshops for B.O.A.C., costing in all £3 million. The assembly hall consisted of three bays, equal in span (358 ft. between main supports) but with the centre bay 420 ft. deep and the two side bays each 270 ft. deep. The structural steel framework spanning the bays was in the form of two-pin arched latticed ribs tied at the haunches and set at 50 ft. centres. Those for the outermost bays were 7 ft. wide and those for the centre bays 5 ft. wide. The roof was of steel decking covered with ½ in. insulating board and mineral-faced felt. All walls except the south were of 11 in. hollow brick up to 15 ft. Above, the external cladding was of asbestos cement sheets, insulated with fibre board.

The eight acres of floor space were kept free of such things as buried pipes and heating panels, allowing the position of the jigs on which the aircraft were built up to be altered in accordance with changes in the production lay-out. The whole south side of the assembly hall was occupied by continuous sliding-folding doors, which were arranged in three pairs, opening either to the sides of the centre. The overall opening was 1,045 ft. long and 65 ft. 9 in. high and the aluminium doors, powered by electric motors, could be opened up in two minutes. The gable ends of the roof of the assembly hall, faced with corrugated asbestos, were painted pink, the aluminium doors green and the door canopy and surround white. The ancillary buildings were mostly faced with a reddish brown brick, in contrast to the colours of the assembly hall but with certain wall panels of white-painted asbestos sheeting to act as visual links with it.

The foundation stone of the London County Council concert hall was laid on Oct. 12 by the prime minister, C. R. Attlee. The architects in charge were R. H. Matthew (architect to the council) and J. L. Martin, deputy architect. The site of the hall is on the south bank of the Thames between Hungerford bridge and Waterloo bridge. The building would consist of three main elements, the concert hall, the reception foyer and the small hall, with ancillary accommodation forming an envelope round the concert hall. Very careful attention was paid to sound transmission and acoustics. There would be total accommodation for 3,450 people in the main hall and 750 people in the small hall. A large part of the building would be constructed in reinforced concrete, which would be faced externally with Portland stone. The work would be carried out in two sections, five-sixths by May 1951 and the remainder, following the close of the Festival of Britain, at the end of the year.

The plan of the 1951 exhibition to be held on the south bank of the Thames was released in Nov. 1949. The various buildings were designed by a number of specially selected architects, and two of the exhibition structures were made the subject of competitions. The dominating buildings on the site would be the new L.C.C. concert hall (described above), and the saucer-shaped aluminium Dome of Discovery, 90 ft. high and 365 ft. in diameter.

Commonwealth. The results of the competition for the new provincial administration headquarters office building at Pretamartzburg, Natal, were published. The winners were Cornwall, C. T. Gall, C. W. O. L. and M. M. Shepherd, F. J. Fassler, D. S. Haddon and A. V. Nunn. The competition was restricted to the architects of Natal and the competitors were required to limit the total cost of the building, including professional fees, to £250,000. The accommodation required comprised four main departments: a secretariat, with five sub-departments; a motor traffic bureau; offices for the provincial accountant and for the auditor, as well as plant rooms, garaging, native quarters, etc.

The Cranbrooke private hotel in Johannesburg, designed by H. le Roith and Partners, was among the most imaginatively conceived buildings completed in South Africa during the year. Accommodation comprised a basement car park and boiler room, ground floor public rooms, kitchen and staff quarters, six bedroom floors with 135 furnished rooms, and native servants' quarters at roof level. Externally the
MODERN FLATS IN BRITAIN
AND SWEDEN

Flats completed at Finsbury (1) in 1949 designed by Tecton and (2) at Holborn designed by Robert Hening and Anthony Chitty. At Örebro, Sweden (3) an 11-storey block of flats by Sven Backstrom and Leif Reinius.

For the Bristol Brabazon aircraft an unusually large assembly hall (4) was built at Filton, near Bristol.
reinforced concrete structure was faced with plum coloured bricks, offset with white rendered panels and balcony trim. On the two main facades of the building the recessed bedroom balconies, with their screen and parapet walls, were used to provide repetitive rhythms, on the one simple and insistent, on the other subtle and modulated.

The results of the Anzac House competition were published. The winners were Walter Bunning and Charles Madden and the assessors, N. B. Freeman, L. A. Robb, Cobden Parkes, P. J. Gordon and J. E. Ancher. The winning design (for Sydney, Australia) was planned in two distinct parts, an auditorium with ancillary rooms and an office building, the two sections being independent with separate entrances. Auditorium accommodation was provided for 787 people. A memorial gallery would serve as an annex to the foyer and as a ceremonial entrance on special occasions. In addition there would be a gymnasium, restaurant, creche, music rooms, board room and offices for ex-service organizations. The seventh to the twelfth floors would be rented office space, with a memorial garden on the roof. The proposed construction was a steel frame with reinforced concrete floors.

Europe. In Sweden an 11-storey block of flats was erected outside the town of Örebro, to the designs of Sven Backstrom and Leif Rennus. Built of reinforced concrete, the building was rendered in bright coloured cement.

In Czechoslovakia two office buildings were completed in Prague. One, by B. Kozak, had a reinforced concrete frame with brick panel infilling, faced with light-brown stone. The other, also of reinforced concrete with brick infilling, was rendered on the outside. The latter, designed by F. Marek, was the first large building in Czechoslovakia to employ the patent Swedish pivoting side-hung double window. On Oct. 6 at Marseilles, France, a flag was unfurled, in the presence of the architect Le Corbusier, on the roof of the new block of flats outside the city, for which the structural framework had been completed.

In Italy an office and flat building was erected in Milan to the designs of Luigi Figini and Gino Pollini. Sited in the garden of an old house, there were two main blocks. One of seven and the other of 11 floors, with offices on the lower floors and flats above. On the top floors of both blocks were penthouses with garden terraces which included bathing pools. The higher block on the street had an entrance way opening through to the garden (a typical arrangement in the old mansions of Milan which had been superseded, in later years, by the closed entrance hall). This gave access to the lower block, which was at the back of the site. The structure was a reinforced concrete frame, faced with rough travertine and artificial stone. In the larger block the frame stood free of the walls of the building flush with the outside edges of the balconies.

The seventh International Congress of Modern Architecture (C.I.A.M.) was to use the better-known initials of the French translation (C.I.A.M.) was held at Bergamo, Italy, from July 23-30. Six permanent commissions were set up and embarked on studies of the following subjects: town planning, inter-relation of the plastic arts, education for architecture and town planning, industrialization of building construction, legislative procedure necessary to implement the Athens charter (a town-planning manifesto issued at the third congress in 1933) and the social programme of the C.I.A.M.

The congress reflected fairly closely the currents of thought among architects of the modern movement, if such it could still be called. Though there was still close concern for the scientific and sociological responsibilities of contemporary architecture, there was evident at the congress an increasing concern for the more intangible aesthetic questions.

(I. R. M. M.)
and throughout an entire school in Bristol, England. It was suggested that the future of the material would develop more rapidly when its own characteristics were stressed. Stainless steel for exterior surfaces was used in several buildings and projected for others. Many experiments were made in the wider application of lightweight aggregates and lightweight combinations of natural and synthetic materials.

Commercial. Perhaps as a by-product of greater costs and as a consequence of a longer period of familiarity with the modern approach to building design, the onset of a period of maturity in the design of commercial and industrial buildings could be detected. An outstanding example was the office building of the United Nations nearing completion in New York City. Its characteristics, such as reserving part of the space for walks and parking, thus eliminating need for interior courts and complicated back premises and providing better light and air, were shared by other projects both under construction and in the design stage.

The highest distinction conferred by the American Institute of Architects, its gold medal, was awarded to the great U.S. architect, Frank Lloyd Wright. At the age of 80, he maintained his role as bea noire of conservatives; he suggested moving the capital of the United States to a more western point, and continued his output of original creative buildings, houses which could be partly built by the owner’s own labour and a theatre which by its triple stage proposed to make use of the lessons of the cinema. The influence of his ideas and of his buildings seemed to be growing as the austerity of the ‘30s and ‘40s was superseded by a warmer, sometimes excessively mannered mood (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; INTERIOR DECORATION; TOWN AND COUNTRY PLANNING) (C. L. V. M.)

**AREAS AND POPULATIONS OF THE COUNTRIES OF THE WORLD.** The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or official estimates are given for each country. Areas in square miles, including inland water areas, are in accordance with the boundaries for the year of the population figure unless otherwise noted.
ARGENTINA

ARGENTINA. The second largest South American republic, occupying the southeastern portion of the continent. Area (excluding the so-called "Zona Austral" which is supposed to comprise the "Malvinas" (i.e., Falklands) and other islands or territory in the Antarctic): 1,079,965 sq. mi. other islands or territory in the Antarctic): 1,079,965 sq. mi. Pop.: (1947 census) 16,108,573; (mid-1948 est.) 16,300,000. The population is overwhelmingly European in origin (mostly Spanish and Italian, with Irish, German, Croat and Polish admixtures); in 1940 about 9% were of mixed blood, the dwindling Indian population was estimated at 262,600 and the total of foreign-born population was 2,355,900. The distribution of the population is uneven: the federal capital and the four provinces of the littoral (La Plata, Corrientes, Paraná and Santa Fé) cover only one-fifth of the total area but have two-thirds of the country's population; urban population is estimated at 75%. Chief towns (pop. 1947 est.): Buenos Aires (q.v.) (capital and leading port, 3,000,371); Avellaneda, a Buenos Aires suburb (279,572); Rosario (464,688); Córdoba (351,644); La Plata (271,738); Lanús (242,760); Santa Fé (168,011); Tucumán (152,508). Language: Spanish. Religion: mainly Roman Catholic; Jewish 350,000. President of the republic, General Juan Domingo Perón (q.v.).

History. During 1949 there was a trend in Argentina toward a more authoritarian central government, denial of civil liberties and economic self-sufficiency.

Early in the year, at the Inter-American Economic conference held in Buenos Aires, there was some disagreement with the United States. The expected flow of dollars to be obtained through sales to European countries benefiting from the Marshall plan and the Economic Co-operation administration programme failed to materialize. The requirements of the five-year industrialization and development plan launched by Perón in 1946, requiring ever-increasing quantities of steel and machinery, and a reduction in foreign trade, as a result of high Argentine prices and large crops elsewhere, created additional economic difficulties.

Miguel Miranda, head of the National Economic council, who controlled the Institute for the Promotion of Trade (I.A.P.I. or Instituto Argentino de Promoción del Intercambio), continued to advocate a nationalistic economic policy of high prices, nationalization of foreign-held assets and self-sufficiency. His theories were mildly opposed by Orlando Maroglio, president of the Central bank, who advocated economic liberalization. This dispute prompted Perón to remove Maroglio and on Jan. 19 appoint Alfonso Gómez Morales as minister of finance and head of the Central bank. He also removed Miranda and appointed Roberto Antonio Arés as minister of national economy. For a few days Miranda's status seemed uncertain and he was reported

Eva Perón (right) wife of the president of Argentina, with the Spanish ambassador and Mrs de Areiliza, on board the Spanish training ship "Juan Sebastian Elcano" when it visited Buenos Aires in Oct. 1949.
to continue as financial adviser to the president. But on Jan. 26 his resignation was announced and he went to Montevideo, Uruguay. The reorganization of the National Economic council seemed to indicate a desire to correct mismanagement and inflation. Postage, telephone rates and taxes were increased, especially in Buenos Aires province.

These measures, however, did not bring about prompt relief. A report issued by the Institute of International Finance of New York University, *The Economic Situation in Argentina*, claimed that Argentine inability to use sterling and other non-convertible currency arising from its trade with Europe to cover its large deficit with the United States was responsible for most of its economic difficulties. The purchase of foreign-owned enterprises, nationalization of internal air lines, railways, telephones and merchant fleet, the reduction of the dollar debt and conversion to a government-controlled economy, were contributory factors to the economic crisis. The report added, however, that Argentine economy was basically sound.

Economic relations between Argentina and Great Britain were rather strained at the beginning of the year. Under the “Andes” agreement of Feb. 12, 1948, Argentina undertook to deliver to Great Britain 400,000 tons of meat in the year ending Feb. 1, 1949. However, during the last four months of 1948 shipments fell short and when the year ended 108,000 tons of the carcase meat remained unshipped with the result that from March 27 the British weekly meat ration was reduced from 1½ to 10d. worth. The Argentine government did not exert themselves to carry out the contract because of the alleged “low price” paid by Britain and because by keeping Britain in short supply it had strengthened its bargaining position in the negotiation of a new agreement.

The negotiations, which opened on Feb. 22, were conducted by Sir John Balfour, the British ambassador, and Señor Aréz, the new minister of national economy. On June 27 a new five-year Anglo-Argentine trade agreement was signed, providing for changes totalling about £125 million each way in the first year and envisaging at least the same level in subsequent years. Sir Stafford Cripps stated in the House of Commons on July 5 that the average price of beef, mutton and lamb purchased under the new agreement was 28% above the price paid under the “Andes” agreement.

Basically, the new treaty was a barter arrangement whereby Argentina would receive machinery and manufactured goods and Great Britain would receive wheat, meat and linseed oil. The treaty constituted an attempt by Perón to overcome the dollar shortage. In the midst of the negotiations, the United States granted $28 million of E.C.A. funds to purchase Mexican and U.S. meat to be sent to Britain. This was regarded by Peronistas as unfair interference in their internal affairs. The United States, on the other hand, considered the treaty as a denial of multilateral trade principles.

The constitutional convention, made up of 109 Peronistas, 48 Radicals and one Labour member, met in Buenos Aires early in the year. The outstanding provisions of the new charter were: (1) it allowed the re-election of the president; (2) it incorporated Perón’s rights of workers—whereby they were granted increased wages and seniority rights—and Eva Perón’s rights of old age; (3) deputes and senators were to be elected together with the president every six years; (4) it incorporated article 40 which granted the government power to nationalize enterprises where mutual sale agreements were not reached; (5) foreigners could become citizens after residing in Argentina two years; after five years’ residence they would have to become citizens unless they expressed a desire to the contrary. The constitution was approved on March 11, after the opposition had walked out charging steam roller tactics by the Peronistas, by a vote of 101 to nil. Juan A. Bramuglia, minister of foreign affairs, who had acquired international renown for his work in the United Nations assembly, was removed on Aug. 11. It was reported he differed with Jerónimo Remorino, ambassador to Washington, over Argentine policy toward the United States. Bramuglia was reported to approve international co-operation and was regarded as the outstanding member of the cabinet and possible presidential candidate. Hipólito Jesús Paz, a 33-year-old law professor, succeeded Bramuglia.

In July the Peronistas held a convention, which urged Perón to run for re-election in 1949. Colonel Domingo R. Mercante, governor of Buenos Aires province and chairman of the Constitutional Convention, was nominated for vice-president. The Peronistas also launched a purge of their party, and Waldino Suárez, governor of Santa Fé, and Pablo Diana, director general of immigration, were expelled from office Augustín Rodriguez Araya, who had charged the government with graft, and Atlíio Cattáneo were expelled from the Chamber of Deputies and fled to Montevideo. To deny Cattáneo’s charge that he had enriched himself in office, Perón, flanked by his cabinet, called a press conference where he produced an affidavit listing the property he owned before he took office. Later La Prensa and La Nación also repeated this charge, openly testing a law recently enacted that provided up to three years’ imprisonment for anyone who alleged a public official had committed a crime.

Congress also passed a law providing that new political parties must wait three years while a federal court passed on their applications; parties already organized could be dissolved if their ideological principles endangered social peace; and coalitions of existing parties were banned. (J. McC.; X.)

**Education.** Schools elementary (1943) 14,565, pupils 2,016,330, teachers 79,081, secondary (1946) 1,145, pupils 221,409, teachers 28,360, universities (1943) 8, students 62,870.

**Agriculture.** Main crops (‘000 metric tons, 1948) wheat 4,700; barley 650, oats 640, rye 229, maize 5,000, potatoes 840; linseed 500, cotton ginned 92, rice 120 Livestock (‘000 head): cattle (June 1947) 41,268, sheep (July 1948) 54,800, pigs (June 1948) 3,500, horses (June 1947) 7,238, asses and mules (June 1947) 501. Meat production (‘000 metric tons, 1947): total 1,105,1, mutton 190, pork 469 Wool production (on a greasy basis, 1948-49): 209,000 metric tons.

**Finance and Banking.** (Million pesos) Budget (1949 est.) revenue 3,860, expenditure 4,569; (1950 est.) revenue 4,870, expenditure 5,835. Budget of autonomous agencies (1950) balanced at 5,022 million pesos National debt (Dec. 1948; in brackets Dec. 1947) 12,940 (11,538). Currency circulation (Jul. 1949; in brackets Jul. 1948): 7,018 (5,201). Gold reserve (May 1949; in brackets May 1948) U.S.$1,024 (214). New government unit is the peso. New currency, devaluation on Sept. 19, 1949, the free market rate was 4½ pesos to the S or 19-37 pesetas to the £. On Oct. 3, 1949, the Argentine Central bank announced a new free rate of 9 pesetas to the S or 25-20 pesetas to the £.

**ARMIES OF THE WORLD.** The outstanding development during 1949 in the armies of the world was an increased standardization of arms into two basic types: Soviet and American. Regional agreements for military
assistance, the groundwork for which was laid in 1948, were generally established in 1949. The two most important alliances were the North Atlantic treaty (q.v.) and the Soviet bloc.

The year saw the North Atlantic alliance nations begin the formation of integrated programmes. Included in the over-all alliance were 12 nations: Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom and the United States. At a meeting of the defence committee of the alliance, composed of the defence ministers of the 12 member nations, agreement was reached on the over-all strategy, an armament production programme and the co-ordination of planning among the five regional groups. The five regional groups were set up as follows: North America, north Atlantic, northern Europe, western Europe and Mediterranean.

Certain important developments also took place in the Soviet bloc of powers. Most important was the defection of Yugoslavia, whose army could no longer be assumed to be part of the Soviet alliance. As far as the remaining powers in the U.S.S.R. orbit were concerned—Poland, Czechoslovakia, Hungary, Bulgaria and Rumania—the outstanding feature of 1949 was an increased sovietization. Indicative of the extent to which the U.S.S.R. would carry sovietization of the armies of its satellites was the situation in Poland, where Marshal Konstantin Rokossovsky, one of the outstanding Soviet commanders in World War II, was appointed head of the Polish armed forces.

The intensive rearmament, particularly of the western powers, which began in 1948, continued apace in 1949. However, economy measures in Britain, France and the United States indicated that the extent of the rearmament was to be definitely limited. The passage of the Military Aid programme by the U.S. congress assured the Atlantic treaty nations of certain assistance in modernizing their armies. Another outstanding development of 1949 saw the almost complete destruction of the Nationalist Chinese armies by the Communists.

The principal change in disposition of the armies of the world in 1949 was the beginning of the evacuation of Indonesia by the Netherlands. The return to the Netherlands of more than 100,000 troops from the Indies was one factor enabling the Netherlands to build up the ground forces required under the Western Union treaty. There was little change of disposition of the occupation forces in Europe, although continued replacement and relief of troops by the Soviet Union in eastern Europe gave rise to many reports and rumours of withdrawal. It would be safe to assume, however, that the Russians would not withdraw their occupation forces until replacement in the form of a reliable eastern German army should take place.

Postwar grouping complete, the three major powers were able to engage in training exercises involving up to the equivalent of a corps. France, as a result of heavy troop commitments in Indo-China, was hampered in effecting large-scale training exercises, except in its occupation zone of Germany.

While extensive research and development of new types of equipment continued, most equipment remained that which was in use at the end of World War II. Economy measures restricted re-equipping by the western powers, although it appeared that under the Military Aid programme certain new types of equipment, particularly late model tanks, would be made available.

United States. The year might well be marked by historians of the U.S. army as the peak of its postwar appropriations. With funds for the fiscal year 1949-50 lower than those for the previous year, the army began to curtail certain of its activities in 1949. Economy measures taken included closing of numerous army posts and concentrating cadres on fewer, large posts, reducing of the number of reserve officers on active duty and calling up of fewer men in the draft. Previous authorization to expand the army to more than 900,000 men was rescinded, and at the end of 1949 strength was at 670,000.

To the regular army strength should be added the national guard as reserve strength. After a year of intensive training, national guard units were in a far better position to bolster the regular force in the event of emergency. Army units of the national guard reached a strength of approximately 350,000 officers and men. Although this could not be considered as entirely effective combat strength, the national guard units had a large number of combat veterans.

Disposition of U.S. units remained approximately the same as in 1948 with the exception that the 11th Airborne division returned from Japan to Camp Campbell, Kentucky. Approximate strength of U.S. forces in 1949 was as follows:

- Far east . . . 127,000 Europe . . . 97,000
- Hawaii . . . 7,000 Caribbean . . . 14,000
- Alaska . . . 13,000 United States . . . 411,000

Exercises were conducted on all scales during the year by
both regular and reserve units. Most of the reserve and national guard units conducted some form of divisional exercises during the year. All of the regular army divisions engaged in extensive unit re-training. The chief exercises conducted by the United States army during the year included: operation "Snowdrop" held in the U.S. zone of Germany in January, involving 16,000 men and designed to test the troops in winter warfare; the Vieques manoeuvres held in the Caribbean in February—an operation held with the navy and naval aviation—in which the 2nd Marine division and the 65th Infantry participated; exercise "Harvest" conducted in Germany in September, involving about 112,000 troops, in which the 18th Infantry was transported approximately 300 mi. by air. Manoeuvres held at Fort Benning, Georgia, stressed the two-bladed attack—infantry-artillery-tank teams advancing in conjunction with airborne assaults. In these exercises, units of the 11th and 82nd Airborne divisions were preceded into the drop zone by so-called "pathfinder teams" which guided the principal attack formation of transports and gliders to the target by radio beams.

There was continued development of new airborne equipment. In 1949 a new technique was successfully developed for dropping completely assembled 105 mm. howitzers. The 376th Airborne Artillery Battalion successfully dropped a battery of four howitzers with ammunition and 150 men during the exercises at Fort Benning.

**Great Britain.** The defence budget for the British army was cut by approximately 20% for the year 1948-49. The ground forces received 44% of a defence outlay of £692,6 million, or funds amounting to £305 million. British army strength in 1949 dropped to 400,000 men, of whom more than 175,000 were overseas. Difficulty was experienced in keeping the army up to strength through voluntary enlistments and there was considerable discussion in parliament about extending the period of conscription from 12 to 18 months.

At the beginning of the year defence critics pointed out that not a single organized division was in the United Kingdom. British army strength was spread throughout the world during 1949 with two divisions in Germany, one division and three scattered brigades in the middle east and the equivalent of almost two divisions throughout the far east.

Principal troop movements in 1949 saw the reinforcement of Hong Kong, bringing the strength of the garrison to approximately 25,000. Units sent there in 1949 included advance elements of the 40th Infantry division including the 28th Infantry brigade, the 3rd Royal Tank regiment plus the 3rd Royal Marine commando brigade. Troop commitments in Malaya remained heavy. At the end of the year elements of the Scots Guards and the Gurkha Rifles were withdrawn from the jungle for refitting and re-training. With the end of hostilities in Greece that particular drain on British manpower was ended and the 3,000 troops were withdrawn.

In addition to the defence exercises conducted in Hong Kong and the actual experience of combatting insurgents in Malaya, British training was concentrated in the army of the Rhine. Exercises in Germany stressed co-ordination of air, artillery, infantry and tanks. British officers also set about training an army of 3,000 in Ceylon. When trained the Ceylonese would take over the coastal and anti-aircraft defence duties.

**U.S.S.R.** Expenditures for the Soviet armed forces totalled 19% of the budget in 1949, compared with 17% in 1948. The Soviet Union continued to maintain approximately 2,500,000 men on active duty organized into 175 to 200 divisions. Inasmuch as Soviet divisional strength is 8,000 men, the U.S.S.R. had 1,600,000 first-line combat troops available for immediate action. Of the active divisions, 50 were armoured units, giving the Soviet army a powerful striking force. In addition to the active units the Soviet Union could mobilize sufficient reserves to field another 100 divisions within 60 to 90 days. Ultimate Soviet army strength could equal 500 combat divisions.

To Soviet army strength should be added that of the satellite armies consisting of about 40 to 60 divisions. Also, there were continued indications during the year that the long-heralded east German army was nearer to becoming a reality. Latest reports stated that a Volksarmee of 60,000 men was to be completely organized by March 1950. The army was to be composed of six motorized divisions equipped with tanks and artillery. The similarity of this force to the 100,000-man army of Germany under the treaty of Versailles was striking. Each man was to be qualified as a weapons instructor, thus immediately indentifying the army as a training cadre. The force was ultimately to consist of 360,000 men, with conscription of all men 18 to 30 reportedly scheduled to begin early in 1950.

The principal changes during 1949 in the disposition of the Soviet army units occurred as a result of the "cold war" between the U.S.S.R. and Yugoslavia. Three new Soviet divisions moved into Rumania and Hungary in August, giving the Soviet army between seven and nine divisions in these two countries. About half of the Soviet forces in these two countries was composed of tank units. In addition there was a combat division in the Soviet zone of Austria and another in Bulgaria. Although far from sufficient in strength to mount an attack, Soviet divisional moves kept the Yugoslav army constantly on the alert.

Soviet training showed an increasing reversion to the pomp, ceremony and caste of the Tsarist army. The Soviet army, for example, had three grades of marshal, adapted a modified version of the "goose step" for parade purposes and encouraged postwar units to identify themselves with famous wartime units. The development of a hereditary officer corps was taking place. Professional army personnel

The British army during 1949 introduced a new combat suit (right). On left is shown the new short greatcoat to be worn over the combat suit.
were provided with better quarters, could obtain better food and had their own commissariats. Separate messes were established for both officers and non-commissioned officers. Training started at an early age, cadet schools beginning at the age of 8. The distinction between officers and other ranks was more sharply emphasized, with iron discipline becoming the rule rather than the exception. Important Soviet training exercises were held in Germany. Among the largest were the autumn manoeuvres at Ohrdruf in which all of the garrisons of the Soviet zone—including the German people's police—participated. Spring manoeuvres were held in Brandenburg.

Marshal Alexandre M. Vasilevsky replaced Nikolai A. Bulganin as minister of the armed forces. For the first time since 1940 before the German invasion, the Soviet army was under the control of a professional soldier. Next to Gheorghy K. Zhukov, Marshal Vasilevsky was considered one of the Soviet army's most gifted strategists.

France. The French budget of national defence amounted in 1949 to Fr.350,000 million. This represented 28% of the total ordinary budget, compared with an expenditure of 30% in 1948. The maximum authorized strength of the army in 1949 was 493,000, although actual strength was closer to 470,000. One of the principal problems of the French army was to maintain the strength of the fighting formations with the short term of service. A bill to broaden conscription was presented to parliament but was not passed.

France was still heavily committed in Indochina in 1949. The French forces, however, were unable to make substantial progress and were able to hold only the main cities and principal lines of communication. At the end of the year the French forces were patrolling the Indochina-Chinese frontier to keep watch on the flow of the defeated troops of Chiang Kai-shek seeking refuge in Indo-China.

Over-all disposition of the French army in 1949 was:
- 150,000 troops in France;
- 60,000 in Germany and Austria;
- 91,000 in north Africa;
- 69,000 in other colonies; and
- 100,000 to 120,000 in Indo-China.

Training of the new French army was still restricted to exercises of divisional size and less as a result of overseas commitments. Recruits were called for one year, and most training concentrated on fundamentals. After the completion of 1 year's service, 16 years had to be served in the first reserve, followed by 8 years in the second reserve.

Professional army schools, having been re-organized and re-staffed to eliminate all traces of the army of 1940, began turning out regular officers and non-commissioned officers of high calibre. The École de Sous-Officiers at Strasbourg had an enrolment of 2,500 students, while the Military academy at Coëtquidan had an enrolment of 1,200 future officers. Requirements for successful completion of both courses were rigorous and there was careful screening of all candidates. From Coëtquidan—the successor to Saint-Cyr—officers advanced to specialized training for their particular branch of the service at the Écoles d'Application.

Under René Pleven, minister of national defence, General Georges Rever was replaced as chief of staff by Major General Clément Blanc. Blanc was formerly chief of staff to General Jean de Lattre de Tassigny (q.v.) at Fontainebleau in the high command of the Western Union.

China. During 1949 the Nationalist forces were virtually destroyed by the Communists. Perhaps the outstanding factor in the Communist victory was not so much the ability of their own forces, but the complete disorganization of Nationalist armies. Defection and disorder contributed heavily to Chiang's defeat. The so-called people's army was in possession of the bulk of the U.S. equipment given to China under lend-lease and sold after the war as surplus. To this should be added all of the Japanese arms left in China in 1945 and a certain amount of Soviet equipment picked up in Manchuria. The most important question concerning the Chinese armed forces was whether Mao could hold together the army of more than 2 million men that had been assembled. Organized into a disciplined army, Mao's force could become the most powerful military instrument to emerge in Asia in modern time, with a potential strength exceeding 5 million.

Europe. Albania. Soviet officers were attempting in Albania to develop a force capable, at least, of guerrilla activity. Alarmed by defection of Yugoslavia from the Soviet orbit, the Soviet army appeared to be developing Albania as a shuttle base for a two-pronged attack on Tito, if necessary.

Czechoslovakia. Although the information could not be confirmed, there was some indication that the progress of sovietization of the Czech army was well advanced. Soviet General Chitinnov was reported to be taking over the command of the Czech army.

Denmark. The Danish defence budget for 1949 was 10% larger than that of 1948. After discussion between the Danish high command and Great Britain, the decision was reached to leave the Danish brigade in Germany for another two years. August manoeuvres were held by the Jutland division.

Finland. Manoeuvres were held near Sappola with approximately 14,500 men participating, the largest held since World War II. Finnish army strength was being maintained by conscription for a nine-month period.

Greece. The heavy fighting ended in Greece in autumn 1949. The Communist rebels announced their withdrawal and survivors of the guerrilla army were reported in Bulgaria and Albania. Fewer than 2,500 rebels were believed left in Greece, with no bands larger than 200. The Greek army announced its intention of keeping units in the Grammos and Vitsi mountains throughout the winter of 1949-50 to prevent any new infiltration. At the end of the fighting there were 210,000 men in the army besides 50,000 gendarmeries. Of these 68,000 were to be demobilized, although a new class of 18,000 conscripts would be called up.

Hungary. There were definite indications that the new Hungarian army—Soviet model—was nearing treaty strength of 70,000 men in 1949. Intensive military activity throughout the country characterized 1949. This included, in addition to the rebuilding of the army, the enlargement and expansion of certain key military airfields and the building of guided missile sites.

Italy. The strength of Italian forces was approximately 170,000 in 1949 organized into five divisions with three infantry regiments each and three divisions with two regiments each, one Alpine brigade and one armoured brigade. Plans called for bringing up the over-all strength of the Italian army from 8 to 12 divisions. The Giulia Alpine brigade of 5,000 men organized around one infantry regiment would be reinforced by two more Alpine brigades of comparable organization. Two new armoured brigades would be formed, modelled on the existing Ariete brigade. Both spring and autumn manoeuvres were held in 1949, the former involving the use of armour.

Netherlands. Out of a military budget of approximately £50 million in 1949, the Netherlands allocated £9-5 million for its contribution to the Western Union. Repatriation of the troops from the Netherlands Indies relieved certain of the problems in meeting Western Union commitments. During the early part of 1949 the only troops in the Netherlands were two battalions of combat troops as well as about 25,000 men in training. However, by the end of 1949 the bulk of the "Seventh of December" division was repatriated, and the 2nd division and Guards units were en route. The
bulk of the 85,000 troops in Indonesia were expected to be returned to the Netherlands or to be demobilized during 1950.

**Norway.** Regular army strength totalled 30,000 men in 1949, but a Home guard of 95,000 was being trained to support the regular force. Norwegian units held training manoeuvres in conjunction with Swedish army units.

**Poland.** Marshal Konstantin Rokossovsky became minister of national defence of Poland. Together with the granting of dual citizenship on a large scale to high ranking Soviet officers, so that they could serve in the Polish army, this assured the virtual integration of this force with that of the Soviet army. A majority of the high-ranking officers were Soviet. All equipment, tactical and strategic direction of the Polish army thereafter came from the U.S.S.R. The combat strength of the army in 1949 consisted of 16 divisions. (See Poland).

**Rumania.** Poorly trained and indifferently equipped with cast-off Soviet equipment, the Rumanian army had approximately five effective combat divisions.

**Yugoslavia.** The budget for defence for the year totalled 16% of the national expenditures. This represented an increase of 12% over the previous year. The Yugoslav army was the strongest force in the Balkans, with 30 infantry and 2 armoured divisions. In addition 4 security divisions were used as border patrols, although armed only with light weapons. Training in Yugoslavia required 2 years compulsory military service. The largest manoeuvres since World War II were held in September, indicating to Moscow that Yugoslavia was not yielding to any further threat of force.

**Commonwealth. Australia.** The regular Australian army was composed of 16,000, with a reserve strength of approximately the same, and a cadet corps of 24,000. There was legislation to increase the regular army by 3,000 and the number of reserves by 26,000. Another bill was introduced to make the Australian regular army a permanent part of the defences. Officers were exchanged with other Commonwealth countries, and several were sent to Great Britain to study the latest developments in land-air warfare.

**Canada.** An intensification in the training of reserves was put into effect in 1949. Closer integration of the Canadian and U.S. armies was achieved with the use of the same communications systems, tactics and command channels. There was continued interchange of officers, and standardization of weapons was effected as far as possible.

**India.** The Indian army concentrated its efforts on the development of a sound system of military education and the creation of an adequate body of reserves. Construction began on the National War academy at Khedakvasla, near Poona. On completion in 1953, the Armed Forces academy at Dehra Dun would be transferred to the new location, where officers for all three services, army, navy and air, would be trained. The new National War academy, which was modelled on Sandhurst in England and the U.S. Military academy at West Point, would admit 500 cadets every year to take the four-year course. An intensive drive was conducted to recruit about 75,000 students for the National Cadet corps. At the end of the year slightly under 60,000 had enrolled. In addition a Territorial army of 130,000 was being organized to act as reserve for the regular Indian army. The Territorial army was to be similar in all respects to the regular force, except that its units would not be required to serve outside India in peacetime.

**New Zealand.** Conscription was adopted by referendum vote. Training would start at the age of 18, and approximately 2,800 men would be called up each year. In addition
factor in the Arab defeat of 1948, continued to keep the Arabs weak. On the other hand, Israel passed a compulsory service law and began the establishment of a regular army in which all men were required to serve. Provision was made for service in the reserves. (See also MUNITIONS OF WAR.)

E. L. S.

ART EXHIBITIONS. Cultural agreements were concluded between a number of nations during 1949; and as restrictions were dropped the interchange of exhibitions became progressively easier than at any time after 1939.

The year 1949 was, indeed, referred to as London's annus mirabilis, on account of the great accumulation of masterpieces assembled there throughout the summer and autumn. After their long continental tour the art treasures from Vienna arrived at the Tate gallery in May—paintings, tapestries, armour (of which an additional exhibition was held at the Tower of London), jewellery, gold and silver ware, ivories, cameos and crystals combined to form a sumptuous and dazzling display. They were narrowly preceded by 121 paintings from the Alte Pinakothek in Munich, which were simultaneously on view at the National gallery. Disappointment was felt at certain lacunae in these exhibitions—in particular, perhaps, at the absence of most of the great paintings by Pieter Brueghel the elder for which Vienna is famed—but remarkable concentrations of work by certain masters resulted. Together with those in the National gallery's own collection, there were, for example, more than 50 important Rubens on view in London. Velasquez was seen to advantage in both exhibitions; Titian and Tintoretto more especially at the Tate.

Attendances at these two rich displays together totalled well over 500,000.

In the autumn a depleted version of the collection of work by Gerard David and his followers, which had been seen earlier in the year at Bruges, was shown by the Arts Council at Messrs. Wildenstein's gallery. In December the winter exhibition at Burlington house devoted to "Landscape in French Art" was opened, composed mainly of oils but including also drawings, engravings and tapestries. The exhibits, ranging in date from the 15th to the 19th century, were drawn in about equal proportions from France and Great Britain and included many little-known works from private and provincial collections. From Germany came Watteau's "Embarkation for Cythera." The exhibition was chiefly notable, however, for the display of landscapes by Claude and Nicholas Poussin, the finest perhaps that has ever been assembled.

At its own headquarters gallery the Arts Council showed a fifth collection of work from overseas—an exhibition of German graphic art of the last 50 years, which was initiated by the Institute of Contemporary Arts. This gave London its most comprehensive view of German expressionism since before 1939. All these importations served to draw attention once again to the postwar pressure on exhibiting space in London, and the decision to re-open the New Burlington galleries under the direction of the Arts Council as a centre for temporary exhibitions was greeted in November with satisfaction.

The year saw no major changes in any of the national collections. At the British museum the Elgin Marbles were returned from their wartime fastnesses and the museum received Campbell Dodgson's gift of more than 5,000 prints and drawings. Three important works—a Titian, a possible Giorgione and Leonardo da Vinci's "Virgin of the Rocks"—were newly cleaned at the National gallery. The Tate gallery showed an exhibition of work by Richard Wilson (organized the previous year in Birmingham) and a memorial exhibition of paintings by James Pryde (seen earlier in Scotland). The uneveness of the latter—it was only the third large showing of his work ever to be arranged—suggested that Pryde's most lasting claim to fame was his collaboration with William Nicholson at the end of the last century as one of the poster-designing "Beggarstaff Brothers." The Victoria and Albert museum organized two admirable exhibitions of applied art. The first consisted of half a century of London Transport posters—those daring and stimulating designs which would always be associated with the name of Frank Pick. The second comprised the first international exhibition of the art of the book jacket, with examples culled from 19 countries. Reference may perhaps here be made to another exhibition of drawings for reproduction, that of historical and contemporary humorous art organized by the Royal Society of Arts.

In February Walter Hutchinson opened his so-called National Gallery of British Sports and Pastimes at the fine 18th century mansion in London that used to be known as Derby house. The collection, which was extensive, was seen to contain many works of curious interest and not a few—more particularly the examples of George Stubbs's work and Constable's "Stratford Mill"—of real artistic worth.

The Sunday pictorial's second annual show of children's drawings and paintings, at the Royal Institute galleries, was selected in 1949 from nearly 47,000 entries submitted from all parts of the country. The Society for Education in Art held in 1949 its third "Pictures for Schools" exhibition, at the Whitechapel gallery. Here, too, very fittingly, was seen the memorial exhibition of work by Mark Gertler in the spring. Often derivative and certainly uneven, Gertler's talent was felt by some to have been too lightly dismissed in the past.

Early in 1949 the ancient dispute between the Tate gallery and the Royal Academy over the purchasing machinery of the Chantrey bequest was brought into the open once again when the entire Chantrey collection to date was exhibited at Burlington house. This was a fascinating reminder of the tastes of an era when British painting was at a low ebb and was visited, probably in a nostalgic frame of mind, by nearly 100,000 people. It did, however, add weight to the contention that the gallery of great art has been shown towards the academic purchase; and later it was announced that the Tate gallery (which received the purchases) had been given equal representation on the selection committee with the Royal Academy (which made the purchases). In the autumn Burlington house showed Leslie Wright's ambitious collection of 18th and 19th century watercolours, a project which gave considerable pleasure.

Between these two exhibitions the Royal Academy held its usual summer show. This was remarkable, apart from the presidential broadcast from the pre-exhibition dinner, chiefly for the inclusion of a gallery devoted to "modern" work in which John Minton's large decorative landscape held a dominating position. The academic idiom was seen at its most incisive in the works of Pietro Annigoni, two portraits by Nando who later attracted attention at the Royal Society of Portrait Painters. By far the most enterprising of the other exhibiting societies was the Royal Society of British Artists, which gave hospitality to a lively show by London art students, to recent work by Giorgio de Chirico and, in the winter, to the most exciting collection of contemporary sculpture since Battersea Park in 1948.

In the provinces some collections, like the Ashmolean at Oxford, completed schemes of postwar re-arrangement. In Glasgow, a selection from the rich Burrell collection, which was presented to the city in 1944, was seen publicly for the first time. Municipal galleries showed varying degrees of initiative, some contenting themselves with accepting Arts Council travelling exhibitions (which included, during 1949, shows devoted to Joshua Reynolds, Indian miniatures,
women artists from the Netherlands, pictures from the Wellington gift, Sickert, Gainsborough, Gordon Craig and old master drawings from Chatsworth; York, on the other hand, organized a centenary exhibition of William Etty and Wakefield, the town nearest to his birthplace, sponsored an impressive retrospective exhibition of work by Henry Moore which later, with some additions, toured Europe under the auspices of the British Council.

Among the more memorable offerings of the commercial galleries in London were exhibitions by Michael Ayton, Francis Bacon, Edward Bawden, Edward Burra, Prunella Clough, Robert Colquhoun, John Craxton, Ivan Hitchens, Frances Hodgkins, Wyndham Lewis, Robert MacBryde, John Minton, Victor Pasmore and F. E. McWilliam. Perhaps the most noticeable thing about the dealers' galleries, however, was the range of foreign work shown as a result of the easing of import restrictions. Apart from those already mentioned, Eugene Berman, Massimo Campigli, Edouard Goerg, Hans Hartung, Charles Howard, Jean Lurçat, Pablo Picasso and Pavel Tchelitchew were among those seen. Many other younger French painters were shown, and pictures by German, Turkish, and Indian artists. There was a display of Polish folk art, and at least three exhibitions of the traditional art of British colonies were arranged in connection with "Colonial Month," that organized by the Royal Anthropological society including some entirely realistic and hitherto unknown heads from Ife, Nigeria.

British masters were seen overseas in Lisbon, Madrid, Hamburg and Oslo; contemporary painting in Paris, Germany, Holland, Luxembourg, the U.S.A. and throughout Australia; work by Paul Nash toured Canada; drawings and prints went to Australia, Canada, New Zealand, Austria, France, Germany, Indonesia; sculpture was included in the international open-air exhibition at Sonsbeek in Holland, and the important Henry Moore exhibition already referred to was seen in Brussels and Paris, where it aroused the greatest interest.

From the many displays in Europe arranged during 1949 mention may be made of the 200 paintings of "Rembrandt and his time," at Schaffhausen; of the opening to the public of the Thyssen collection at Lugano; of the belated centenary exhibition of Paul Gauguin in Paris; and the assembly in Venice of over 100 painting and drawings by Giovanni Bellini from all over western Europe and America. As an augury for the future, note should perhaps be taken of the first travelling exhibition of fine reproductions organized and circulated by U.N.E.S.C.O. (M. H. M.)

United States. The State University of Iowa, Iowa city, devoted its fifth annual summer show entirely to sculpture. Sculpture also had a prominent showing during the summer
at the Third Fairmount Park Sculpture International in the rotunda and in the garden court of the Philadelphia museum. The object of the exhibition was to be a basis of selection for sculptors to create the remaining historical groups of the Ellen Phillips Samuel memorial in Fairmount park. Foreign artists represented numbered 32, compared with 216 from the United States. The Philadelphia museum also exhibited the Henry P. McIlhenny collection, containing the finest pictures of the 19th century and contemporary period. Among these were Jacques Louis David's "Pius VII and Cardinal Caprara"; Ingres' "Countess of Tournon"; Renoir's "Mlle. Legrande"; Cézanne's "Mme. Cézanne"; and Picasso's "Pitcher and Bowl of Fruit."

The Museum of Modern Art in New York had a full-scale retrospective one-man show of Georges Braque (in collaboration with the Cleveland museum) covering work from 1904 to 1947. It also held a survey of 20th century Italian art. Beginning with early experiments in sustained motion by the Futurists, Boccioni and Balla, the exhibition then showed an impressive group of early works by De Chirico and came down to the present with emphasis on the sculpture of Marini and various abstract painters. San Francisco's California Palace of the Legion of Honor celebrated its 25th anniversary with an exhibition of 32 paintings and 24 drawings of the French 18th century lent by the Louvre and several French provincial museums. Seven Watteau's, including "Le Faux Pas" lent by the Louvre, and Chardin's famous "Le Jeune Homme au Violon," also from the Louvre, were exhibited.

The Italian government made two good-will gestures of gratitude in return for the help given by the United States in the restoration of Italian monuments. Michelangelo's "David." (from the Bargello in Florence) was lent to the National gallery and Donatello's San Lodovico (1423), which had been cleaned to reveal the full splendour of the original gilt bronze, was sent from the church of Sante Croce in Florence to the Metropolitan museum, the Art Institute of Chicago and a few other American museums.

American art of the earlier periods was prominent in the year's exhibition calendar. Washington's Corcoran gallery under the title "De Gustibus" showed 100 years of American taste from Thomas Cole to the present. In the meantime the Wadsworth atheneum in Hartford, Connecticut, in collaboration with the Whitney Museum of American Art, New York, arranged a large exhibition of the work of Thomas Cole (1801-48).

The Art Institute of Chicago put on a comprehensive showing of American paintings, silver and blown-up architectural photographs under the title "From Colony to Nation" covering the period 1650-1815. Leonardo da Vinci and his contemporaries were shown in an exhibition at the Los Angeles County museum. A feature was the "Madonna of the Pomegranate," thought to be his earliest painting, and nine of his drawings. Of great interest were the reconstructions of several of Leonardo's designs for mechanical contrivances, including a flying machine.

The Louise and Walter Arensberg collection of 20th-century art was permitted to leave their home in Hollywood, California, for the first time and was featured at the Art Institute of Chicago. More than 200 paintings, water colours and pieces of sculpture made up the group which marked the foundation of the art of this century. Sculpture by Brancusi, early paintings by Braque, Picasso and Marcel Duchamp (including all four versions of the "Nude Descending a Staircase") and works by Joan Miro, Paul Klee and Salvador Dali were notable in the collection.

The Metropolitan museum opened the autumn season with a great exhibition of the work of Vincent Van Gogh (organized in co-operation with the Art Institute of Chicago), consisting of 97 oils and 67 drawings lent for the most part from two Dutch sources, the Kröller-Muller museum in Otterlo, Netherlands, and the collection of the artist's nephew and namesake, Vincent Van Gogh. The value of the collection was reputed to be $3 million.

Art treasures from the Vienna collections was another great European exhibition which crossed the Atlantic; it opened at the National gallery in Washington, D.C., in November. (See also ART SALES; ARTS COUNCIL; DRAWING AND ENGRAVING; PAINTING; SCULPTURE.) (F. A. SW.)

**ARTHITIS.** During 1949 all advances in the field of rheumatic diseases were overshadowed by the contributions of P. S. Hench, E. C. Kendall, C. H. Slocumb and H. F. Polley who demonstrated the effects on rheumatoid arthritis of 17-hydroxy-11-dehydrocorticosterone (Kendall's Compound E, later renamed "Cortisone").

While investigating the mechanism whereby remissions of rheumatoid arthritis occur during pregnancy and certain diseases complicated by jaundice, Hench and his co-workers found it probable that the factor responsible for the relief of arthritis might be a hormone liberated by one of the endocrine glands other than the sex glands. Trials of various hormones available prior to 1948 had failed. Kendall had isolated various fractions of the secretion of the adrenal cortex, one of which was called Compound E. The quantity of isolated material was inadequate to allow studies of the effect of this adrenal cortical fraction on arthritis. For many years, Kendall and his associates and biochemists in other laboratories had been collaborating to synthesize this compound. Finally in 1948 enough of this material was produced (starting from one of the acids in ox bile) to allow a study of its effects on patients to be made. During the winter of 1948-49 at the Mayo clinic, Rochester, Minnesota, the effects of Compound E were carefully observed in several patients with rheumatoid arthritis. All the patients made remarkable improvements. Stiffness quickly lessened, movement of the joints increased, pain, swelling and tenderness of the inflamed joints were reduced or disappeared in a period of only a few weeks, and there was a gratifying improvement in the general health of the patient. Report of these investigations was made in the spring of 1949. Throughout the remainder of the year Compound E was made available to other investigators, all of whom confirmed the reports of Hench and his collaborators.

Cortisone was given by injection daily to accomplish remission or near-remission of the disease. When it was discontinued, after a short period of administration, the arthritis usually relapsed, although some patients maintained a portion of the improvement. In some persons receiving the drug for longer periods, various undesirable side effects were noted—all of which disappeared after administration of the hormone was discontinued. A fraction of the hormone complex produced by the pituitary gland stimulated the adrenal glands to liberate an increased amount of cortical hormones including Cortisone. This pituitary secretion, known as "adrenocorticotropic hormone" (ACTH) was isolated in a potent and purified form suitable for injection into humans, and when administered to patients with rheumatoid arthritis effects were observed similar to those resulting from Cortisone.

The effects of Cortisone and ACTH were studied in other rheumatic disorders and connective tissue diseases. Some improvement was observed in rheumatic fever, gout, diffuse lupus erythematosus, neurodermatomatositis and other collagen diseases.

The extreme difficulty of isolating ACTH and the tedious and difficult task of synthesizing Cortisone and the limited
supply of ox-bile acid severely restricted the production of these hormones. Consequently these substances were important in 1949, chiefly as research tools in the study of rheumatic diseases. The whole problem of connective tissue and rheumatic diseases took on a new aspect. The mystery surrounding rheumatism could now be clarified so that an amelioration of these painful diseases might be effected.

Much research however lay ahead: research to improve the methods of manufacture so that larger supplies of these hormones could be produced at a lower cost; the definition of the scope and limitations of effects of the hormones in different diseases; methods of administration to produce the greatest benefit and the minimum, or the absence, of undesired effects; the elucidation of the mechanism of effect of these hormones which in time should reveal the nature and possibly the cause of the diseases; the study of the effects of steroids chemically similar to Cortisone; and the influence of all effective steroids on the entire endocrine glandular system and metabolic functions. (See also CHEMISTRY.)

ART SALES. Prices tended to remain high during 1949 as a counterbalance to currency fluctuations and in Great Britain a proposed Rembrandt exhibition was unable to be held because devaluation of sterling made the insurance costs prohibitive.

There were two moments of high drama during the year. The first occurred at Sotheby's on Feb. 16 when a Rubens "Suicide of Dido" came up for sale. Its owner offered it to Reading Art Gallery but the authorities refused the gift and it was afterwards auctioned at Henley-on-Thames, Oxfordshire, for 50s. At Sotheby's it was bought for £3,200. The second happened at Christie's in June when the Graham Robertson collection of Works by William Blake came up for sale. Graham Robertson had bought the famous "Ghost of a Flea," now in the Tate gallery, for £12 and had also acquired the collection of Thomas Butts, one of Blake's patrons. He had made many gifts to public galleries and it was expected that he would have made certain bequests in his will. This did not, however, seem to be the case, and the items were auctioned in the usual way. The National Gallery of Scotland bid 7,400 guineas for "Job Confessing His Presumption"; the Tate gallery 8,600 guineas for three fine examples of William Blake; and the British museum 6,000 guineas for "Jacob's Ladder" and "The Sacrifice of Jephthah's Daughters." The Fitzwilliam museum became the owner of "The Ascension" for 7,000 guineas. The sale realized £61,600. At its conclusion it was announced that, according to the terms of the will, works acquired by public galleries would be presented to them through the National Art Collections' fund, representing a bequest of £41,181.

Public art galleries were fortunate in 1949. The Fitzwilliam acquired Constable's "Hampstead Heath" (from the Eckstein collection) for £13,000; the Barber institute at Birmingham bought The Butleigh Salt (17th century, silver gilt) for £4,400 and a sheet of Rembrandt drawings in pen and bistre for £4,410. At the same sale a Rowlandson drawing, "The Accusation," went for £25 5s. On the other hand, at Sotheby's in July, a Constable of "The Marine Peer at Brighton" was withdrawn at £13,500. The most interesting of several acquisitions made by W. V. Hutchinson for the National Gallery of British Arts and Pastimes was a series of eight Henry Alkens of "The Grand Leicestershire Steeplechase, 1829," for which he paid £1,995.

The most impressive series of sales, which had begun in 1948, was of various works of art acquired by the late Sir Bernard Fekestein. Apart from the Constable, which went to the Fitzwilliam, the most noteworthy examples of painting from the collection were Morland's "Children Birdnesting" and "Juvenile Navigators," for which W. V. Hutchinson gave £10,200 and a Fantin Latour flower-piece, which sold for £4,200, as against £819 in 1933. The only notable depreciation was a Gainsborough, "Woodland Scene," which went for £1,800 as against £3,150 in 1937.

Amongst other sections of the Eckstein collection £1,050 was given for a Persian manuscript of the longest poem in the world (120,000 lines): "The Book of Kings"; and an easter egg in rock crystal made by Fabergé and set with rose diamonds brought £1,700; a panel of Beauvais tapestry, after a Boucher design, sold for £2,400 and a Tampion travelling clock (¾ in. high) in its original case sold for £2,300.

Contemporary artists commanded a fair market throughout the year. A Raoul Dufy "View of Langres" sold at £350; and £880 was given for two Richard Sickert views of Dieppe and £790 for two Augustus John portraits of his sons, Edwin and Caspar. Winston Churchill realized £1,312 10s. at Christie's in aid of the Y.W.C.A.

Provincial sales were vigorous, although their contents were not up to the standard of the London sale-rooms. One interesting event was the sale in July of a work by Rubens and Snyder's for £2,900 at Kimbolton castle. (B. Dr.)

Sotheby sold the H. A. C. Gregory collection of Constable paintings and drawings at £28,467, top item of which was an oil, the "Marine Parade" at £13,500. This was shown in the Masterpieces of English Painting at the Art Institute of Chicago in 1946.

Christie's held several important sales during the season including 139 lots of antique gold and silver sold for the earl of Strathmore at a total of £15,704. The rarest item was a Charles II gold porringer (1675) which sold for £4,200. Christie's auctioned the collection of Mrs. Arthur James in which a notable Guardi, "Entrance into the Grand Canal," went for £10,290.

UNITED STATES. Kende galleries announced a 1948-49 season totalling more than $1 million, their largest single sale having been to the Cortlandt F. B. Bishop library which brought $325,900; an Aesop in maioli binding went for $24,000; a Paris Tasso (1771) with 68 original Gravelot drawings went for $23,500; and a Molère (1734) for $20,250. In the Oscar Bondy sale Dosso Dossi's "The Combat between Roland and Rodomonte" went at $12,000 and Giovanni di Paolo's "Adoration of the Magi" for $11,000.

Parke-Bernett galleries of New York city, the leading art auction house of the country, reported that their season amounted to $5,618,628 50, which was a $400,000 increase over the previous year. The highest price paid for a single item was $54,000 for Lincoln's "Gettysburg Address" and the largest individual sale was comprised mostly of early Christian and Byzantine art from the estate of Joseph Brummer and totalled $739,510. The top item in this sale was a pair of Burgundian Gothic tapestries at $42,000. A Saxon 12th-century champlevé plaque brought $11,000.

Leading prices at sales of paintings were $25,000 for Degas' "L'Ecole de Ballet"; $12,000 for Winslow Homer's water colour "The Voice from the Cliffs"; $10,500 for Renoir's "Young Bather"; $7,000 for Frederic Remington's "Among the Led Horses"; and $6,500 for Grant Wood's "Birthplace of Herbert Hoover."

The sale of the Joseph H. Seaman prints brought $90,067. Of these, Rembrandt's "Christ Healing the Sick," went for $7,500, "The Young Haering" for $3,200, "Ephraim..."
**ARTS COUNCIL—ASTRONOMY**

**Bonus** for $3,000, and "Clement de Jonghe" for $2,600.

Many books came up at auction including a first edition of Dante's Divine Comedy at $9,000 and a Caxton edition (1478) of Chaucer's Canterbury Tales at $4,000. (See also Art Exhibitions.) (F.A.Sw.)

**ARTS COUNCIL.** For the Arts Council the year 1949 was one of consolidation rather than expansion. The council's grant-in-aid from the exchequer for the financial year 1949-50 was the same as in 1948-49, viz., £575,000. Assistance was again given on much the same scale as in previous years to theatre, opera and ballet companies, to orchestras and to arts clubs, arts centres and chamber music clubs throughout Great Britain. The largest grant was to the Covent Garden Opera trust, for building up a national opera and ballet at Covent Garden on a scale and of a standard worthy of the country's achievements in other fields. The smallest grants were those to individual arts clubs for purchase of equipment or as guarantees against loss on concerts and other events.

Apart from the continuation and consolidation of the programme already laid down, the Arts Council was concerned in 1949 with encouraging two special developments. The first of these was the new interest in artistic enterprise made possible for municipalities under the Local Government Act, 1948. The council was naturally anxious to cooperate with local authorities in the development of plans to implement these powers and the local authorities, on their side, presented many new and varied schemes for the council's consideration, assistance and advice. Examples of the kind of co-operation made possible with the joint assistance of the municipality and the Arts Council were the arts centres established at Dudley in Worcestershire and Leek in Derbyshire; the Civic theatre founded at Chesterfield; the Playhouse at Nottingham; and the theatre company installed at the Grand theatre, Swansea. In all these instances the council sought to show how an independent venture, receiving the support of the citizens, might be encouraged by the assistance of public funds, both from the rates through the local authority and from the exchequer through the Arts Council. The second particular interest of the Arts Council in 1949 was in preparations for the Festival of Britain, 1951. When the festival was first announced in the House of Commons in Dec. 1947, the council was charged by the chancellor of the exchequer with the responsibility of organizing the Festival of the Arts as part of the national celebrations. The year saw the successful progress of a number of local festivals in which the council collaborated with local authorities, the supreme example of this being the International Festival of Music and Drama at Edinburgh.

It was the continuing policy of the Arts Council to assist independent ventures with grants, loans and guarantees against loss, rather than itself to organize and present entertainment. The council did, however, sponsor certain directly provided concerts and theatrical tours, and it was also the agency for several art exhibitions in London and the provinces. The loan of the pictures from the Alte Pinakothek at Munich and of the art treasures from Vienna, arranged by the council, made the summer of 1949 a period of special interest to Londoners. On Nov. 9 the council re-opened the newly decorated and lighted New Burlington galleries in London with an exhibition of modern British art. (See also Art Exhibitions.) (M.C.G.)

**ASCENSION ISLAND:** see Saint Helena.

**ASSASSINATIONS.** Assassinations, actual or attempted, during 1949 included the following:

- Feb. 4. Tehran, Persia. The Shah was shot at and slightly wounded by a member of the Tudeh party, Fakhr Rai, who after the attempt was attacked by the crowd and died the following day.
- Feb. 12. Cairo, Egypt. Sheikh Hassan el-Banna, leader of the Moslem brotherhood, was shot and fatally wounded.
- April 28. Lubon, Philippines. Mme. Manuel Quizon, widow of president Quizon who died on Aug. 1, 1944, and nine persons with her were ambushed and killed by bandits while driving through hill country in Neua Eypa.
- May 25. Detroit, United States. Victor Reuther, educational director of the United Automobile Workers' union, was shot in the face and neck and severely wounded at his home. His brother Walter was similarly attacked on April 20, 1948.
- June 26. Seoul, Korea. Kim Koo, a politician and opponent of President Syngman Rhee, was assassinated by an army lieutenant, An Du Hi, who was sentenced to death by a military court on Aug. 6.
- July 6. Tokyo, Japan. Mr. Shimosaya, president of the National Railway association, was found dead, believed to have been murdered, on the railway track near Tokyo.
- Aug. 5. Nawnpalang, Burma. The Sawbwa of Nawnpalang state, Sao Tin Hla, was murdered by Karen rebels in front of his palace and Sao Tun Sein, Sawbwa of Pwehla, was wounded.
- Sept. 19. Hong Kong. General Yang Chueh, former Chinese ambassador to Moscow, was shot and killed by gunmen, believed to have been Kuomintang agents.
- Nov. 3. Quito, Ecuador. An attempt was made on the life of President Guala Plaza Lasso when an explosion destroyed a bridge shortly after his car had passed over it.
- Nov. 4. Tehran, Persia. Abdol Hossein Hajiri, prime minister from June to Nov. 1948, was shot and severely wounded by Hossein Imami. Hossein Hajiri died on Nov. 5; his assailant was sentenced to death by a military court the same day and executed on Nov. 9.
- Nov. 6 Damascus, Syria. Lieutenant Colonel Walter Francis Sirling, Damascus correspondent of The Times, London, was shot at and severely wounded by three men dressed as tribesmen.
- Dec. 3. Sibu, Sarawak. Duncan George Stewart, governor and commander in chief of Sarawak, was stabbed by a young Malay during the governor's first visit to Sibu. He was seriously wounded and flown to Singapore for medical treatment. He died on Dec. 10, and was buried the following day in Singapore with full military honours.
- Dec. 10. Freetown, Sierra Leone. Sir John Lucie-Smith, chief justice of Sierra Leone, was shot at and wounded while asleep in his house at 3 a.m.

**ASSOCIATION FOOTBALL: see Football.**

**ASTRONOMY.** Observatories. The year 1949 opened with an event of high significance for the progress of astronomy: the making of the first photographs with the 200 in. Hale telescope on Mount Palomar, California, U.S.A. From January to April about 60 exposures were made under the direction of Dr. Edwin B. Hubble, who stated that they confirmed the most optimistic predictions of the designers. Some plates recorded galaxies at an estimated distance of about 1,000 million light-years. For these tests the figure of the great mirror had intentionally been left a shade too high near the edge; afterwards it was dismantled for final re-touching. The Hale telescope has for an essential companion-instrument the 48 in. Schmidt camera. Whereas the
Schmidt will reveal almost all objects "readily seen" with the 200 in. instrument it can show on a single plate a region of the sky some hundreds of times greater than the area covered by one plate taken with the latter. In July the Schmidt was put to work on the National Geographic Society—Palomar Observatory Sky Atlas, which would take about four years to complete and would comprise about 2,000 plates, covering about three-fourths of the entire sky, photographed once in blue light and once in red. It would record some 10 million galaxies and some 500 million stars of our own Galaxy. Besides serving as an atlas proper, it would serve other important purposes. It would provide the most extensive survey yet made of the distribution of galaxies. Again, for instance, in future when a nova appears there will be a good chance of identifying the star concerned in the Atlas and thus seeing what sort it was before its outburst, a feature about which existing evidence is meagre.

Perhaps the most important purpose of the Atlas, however, is to locate objects for detailed study with the 200 in. Thus, one of the most significant classes of object for cosmological investigation is that of remote clusters of galaxies. The few that have been discovered by chance indicate that there must be a large number: the 48 in. Schmidt is incomparably the best existing instrument for finding them, as is the 200 in. for studying them when found.

The Solar department was the first observing department of the Royal Greenwich observatory to start work at Hurstmonceux, Sussex, whither the whole observatory will be transferred during the next few years. The Nautical Almanac office and some other non-observing departments were in operation at Hurstmonceux by the end of the year. The trustees of the McGregor fund in Michigan presented a 98 in. "Pyrex" glass disk for use in the Isaac Newton telescope.

Interstellar matter. This has been one of the most fruitful fields of astronomical research in current years. The existence of interstellar matter, in addition to what is immediately evident in the form of bright and dark nebulae, has long been known. In the part of the Galaxy near the Sun, it is estimated to comprise about as much material as that of the stars themselves in the same region. Various processes of inference lead to the conclusion that it consists predominantly of hydrogen gas. For the rest, apart from an undetermined amount of helium, it contains under 1% by mass of other elements in the gaseous state and about an equal mass of solid particles. There is no evidence of any considerable variation of composition from one part of space to another.

Interstellar gas absorbs certain frequencies of the stellar radiation traversing it, thus producing "interstellar lines" in the stellar spectra. Observable interstellar lines are all due to certain of the "other elements" mentioned (conditions in interstellar space being such that the hydrogen and helium present cannot in general produce absorption lines in accessible frequencies) and, as recently identified by A. McKellar and A. E. Douglas, the molecular combinations CN and CH. In 1936, S. C. Beals discovered that interstellar lines are sometimes multiple in structure, indicating their production in such cases by several interstellar clouds with different sightline velocities.

In 1949, W. S. Adams gave an account of work at Mount Wilson, nr. Pasadena, California, which forms the greatest single observational contribution yet made to the study of details of the distribution and motion of interstellar gas. The work is mainly a skilful exploitation of Beals's discovery, employing the utmost refinement of spectroscopic technique. Adams used about 300 selected stars in whose spectra the interstellar lines are not confused by lines proper to the stars themselves, and whose brightness and relative
ATHENS

spacing renders them suitable to yield the desired information.

Some conclusions indicated or confirmed by Adams were:
(i) The molecules mentioned are prevalent in interstellar gas and have effectively the same spatial distribution as the more familiar atoms in the gas. (ii) The interstellar gas is largely concentrated into clouds whose thickness averages something of the order of 20 parsecs. The clouds themselves tend to concentrate towards the galactic plane in whose vicinity they are estimated to occupy about 15% of interstellar space. (iii) The clouds have individual random velocities averaging about 20 km/sec., the larger clouds having in general the smaller speeds. (iv) Apart from certain particular systems, there is no special association between individual clouds and individual stars.

Turning to the solid particles in interstellar matter, H. C. van de Hulst published from Utrecht, Holland, an extensive theoretical investigation. Various general considerations show the particles to be about 10^-6 cm. in diameter. He studied the physical chemistry of the condensation of such particles in a gas under interstellar conditions and concluded that they have indeed originated by condensation. Therefore he favoured the term "smoke" for this constituent of interstellar matter, rather than "dust," which implies an origin in the disintegration of larger bodies. He concluded also that the smoke might be described as consisting of "ice with impurities." He investigated the optical properties of the particles and showed that they provide a good explanation of interstellar extinction of stellar radiation as regards both total amount and dependence on wavelength. His value for the mean density of the smoke in the neighbourhood of the Sun is 1.4 × 10^-26 g/cc.

W. A. Hiltner announced the remarkable discovery that light from some distant stars is polarized (to the extent of about 10%). His observations showed that the effect is not associated with particular stars but must be introduced in the passage of the radiation through interstellar space. Scattering by the smoke particles is the only known agency that might operate in this way. As Hiltner pointed out, this would require the particles to be non-spherical and oriented in some preferential directions. The effect might thus provide an unexpected means for investigating physical conditions in interstellar space.

Sun. The luminosity of the Sun, measured on the scale of stellar magnitudes, is a quantity whose accurate determination is of great importance but also of great practical difficulty. R. van der R. Woolley and S. C. B. Gascoigne published a new determination from a comparison of the Sun and Sirius by photographic spectrophotometry using devices developed at Mount Stromlo Commonwealth observatory at Canberra, Australia. The comparison was made at four wavelengths. The authors cited also preliminary results of photoelectric spectrophotometry performed at Mount Stromlo which showed that the previously accepted magnitude of Sirius was somewhat too high. Allowing for this, they obtained about 26.9 for the Sun's apparent photoval magnitude in good agreement with earlier determinations.

E. Durand, J. J. Oberley and R. Tousey published an analysis of the first rocket ultraviolet solar spectra, which resulted from the work of the U.S. Naval Research laboratory at Washington. The spectra were obtained at heights of 35 to 75 km. They covered the hitherto unobserved wavelength-interval from 2,900 to 2,200 angstroms, and this is found to be more complex than the familiar part of the spectrum. Certain lines or line-multiplets of neutral and ionized iron and magnesium, of neutral silicon and of ionized magnesium feature prominently. A pair of strong lines due to ionized magnesium reproduces characteristics familiar in the H and K lines of ionized calcium in the visible spectrum. The background intensity was estimated to be well below the black-body intensity for 6,000 degrees. The results will repay much further study; meanwhile they appear generally to confirm the predictions of solar physicists.

One of the three "crucial tests" of Einstein's relativity theory is that the lines in the solar spectrum should show a red-shift in wavelength of about two parts in a million with respect to the corresponding lines in laboratory spectra. M. G. Adam published her new "absolute" measurements of solar wavelengths using the high dispersion of better than one angstrom per mm. rendered possible by an interferometric method. After all known corrections had been applied, she found almost no shift in wavelength except in the light from the outermost 10% of the radius of the solar disk, the shift reaching about the Einstein value near the edge of the disk. She refuted the earlier explanation of such a result, depending upon postulated radial currents in the solar atmosphere. Consequently, it was still undecided whether the Einstein effect does exist and is masked for most of the disk by some other unknown effect or whether it does not exist and some unknown effect produces a shift only near the solar limb.

Solar system. Following the discovery of a fifth satellite of Uranus in 1948, a second satellite of Neptune was discovered in 1949, also with the 82 in. reflector of the McDonald observatory, Mount Locke, Texas. The newly found satellite has an orbital radius more than 20 times that of the previously known satellite Triton, and a period of about two years; its estimated diameter is only about 200 mi.

An interesting relation between the solar system and the interstellar "smoke" mentioned above was suggested by a new theory of the origin of comets given by R. A. Lyttleton. According to this, if the sun traverses an interstellar cloud, the smoke particles moving in its gravitational field tended to collide with each other in its wake and so to form a smoke trail there. Examining the further gravitational effects which ensues, Lyttleton concluded that this trail would give rise to comets having characteristics as regards number, masses and orbits in agreement with actuality.

ATHENS, capital of Greece and—east of Rome and south of Vienna—the largest city of Europe. Area: 17 sq. mi. Pop.: (1938 est.) 392,731; (1949 est.) 700,000. Lord mayor, General Ioannis Pitsikas. What might be called Greater Athens fills a triangle of which one side is based on the Saronic gulf from Perama to Vouliagmeni with the opposite vertex at Eakin. This Greater Athens covers approximately 70 sq. mi. and contained in 1949 some 1.5 million inhabitants—one-fifth of the population of Greece. In fact, however, what appears to be agglomeration is divided into 39 townships and rural districts of which Athens proper and the port of Piraeus are the largest. After the liberation the city was governed by a lord mayor and a municipal council appointed by the government. In May, 1949, women were represented on the council by the appointment of Mmes. E. Pantelaki and A. Manzolinou. The cost of repair work to public utilities in existence before 1940 was estimated at £410,000. As the population had nearly doubled between 1938 and 1949, essential new public services were estimated to cost over £10 million. Substantial progress was made at the Piraeus with the extensive reconstruction begun in 1948.

On Nov. 20 the departure from the city of the 1st battalion East Surrey regiment was marked by a ceremonial parade at which the salute was taken by King Paul, Queen Frederika,
The main event of the season in Scandinavia was the match against the United States in which Scandinavia were beaten by 238½ points to 224½. In this contest the winning performance in six of the 23 events beat that achieved in the 1948 Olympic Games. J. Fuchs, U.S.A., broke the world record for the weight with a putt of 58 ft. 4½ in. and F. E. Gordien, U.S.A., the discus record with a throw of 186 ft. 10½ in.

Sweden remained the best of the Scandinavian countries and in a match in September beat the rest of Scandinavia by 232 points to 196, a larger margin than in the same event in 1947. A. Ahman, winner of the Olympic hop, step and jump won this event and also the high jump. In G. Leandersson Sweden had the greatest marathon runner of the day. Amongst the milers, O. Aberg now led L. Strand, S. Landqvist, G. Bergkvist and the Olympic champion H. Eriksson. Finnish athletics showed a steady improvement and Czechoslovakia was defeated by 104 points to 97. The great distance runner V. Heino, at 36 years of age, achieved a remarkable return to form and was the only man in the world capable of extending the Czech, E. Zatopek. On Sept. 1 Heino recaptured the world record for the 10,000 m. which he covered in 29 min. 27½ sec. However, on Oct. 22, the record fell again to Zatopek with a time of 29 min. 21½ sec. Iceland contributed perhaps the greatest athlete in his history in O. Clausen, the leading Scandinavian decathlon expert.

A small team from Hungary travelled to London to compete in the A.A.A. championships. I. Németh won the hammer and F. Klöcs the discus.

There was considerable evidence of a rebirth of athletics in Germany, although she played no part in international competition. The sprinters, long jumpers and hammer throwers were thought to be among the best in Europe, and there were some remarkable women athletes.

French athletics suffered from the retirement of the great middle distance runner M. Hanches, but the loss was made less acute by the improvement of the twins Jean and Jacques Vernier. J. Heinrich set up a new French decathlon record with 7,165 points. France won the international cross country championship at Belfast in March, supplying the individual winner, A. Mimoun.

In Great Britain and Ireland the improvement in the general standard was more marked than elsewhere. A team from Oxford and Cambridge visited the United States in June and, although beaten by Princeton and Cornell, gained a clear victory over Harvard and Yale. Great Britain beat France by 82 points to 65 at the beginning of August, and a week later London defeated Gothenburg in the first match between the two cities by 83 points to 57. The outstanding performances of the season were in the high jump, in which both R. C. Pavitt and P. Wells cleared 6 ft. 6 in., breaking an English native record that had stood since 1921. G. W. Nankeville was probably the best of a group of six or seven milers, all capable of 4 min. 14 sec. or better. A. S. Wint was still outstanding in the middle distances, but E. McD. Bailey had lost much of his fire as a sprinter and had to give way to a Jamaican L. Laing. J. T. Holden remained one of the best marathon runners. D. O. Finlay (q.v.), at the age of 40, won the 120 yd. A.A.A. hurdles championship for the eighth time.

Oxford beat Cambridge in the university sports in March by 72 points to 54. R. G. Bannister of Oxford broke the mile record for the meeting which had stood since 1905 and P. R. L. Morgan, also of Oxford, the three mile record set up in 1914. The Kinnaird trophy was won by Polytechnic harriers, the Achilles club, holders from 1935, fielding a team weakened by the absence of many members representing Oxford and Cambridge in the United States. (M. A. Me.)

The United States. The National Amateur Athletic union's 100 m. and 200 m. sprint titles were won by Andy Stanford
of Seton Hall. Craig Dixon of the University of California at Los Angeles won both the 110 m. high hurdles and 200 m. low hurdles events, defeating Harrison Dillard in the high event. In 1948 Dillard set up a world record of 13·6 sec. for this event, but in 1949 both Dixon and Dillard could only achieve 13·8 sec. Malvin Whitfield, 1948 Olympic winner at 800 m., won the National Collegiate Athletic association’s outdoor and the A.A.U. titles at this distance. His best time during the season was 1 min. 50·3 sec., 1·1 sec. slower than his Olympic record. The Wanamaker mile went to Don Gehrmann of Wisconsin who beat Willy Slykhuis of the Netherlands in 4 min. 9·5 sec. Gehrmann also won the A.A.U. 5,000 m. and 10,000 m. championships. The 1948 Olympic decathlon winner, Bon Mathias, retained his A.A.U. championship. Charley Moore of Cornell university established a new national record of 51·1 sec. for the 400 m. hurdles. The best high jump of the season was by Walters of Texas with 6 ft. 8 5/8 in. while Gay Bryan of Stanford university jumped 25 ft. 4 1/2 in. in the long jump.

Five Europeans, Gaston Reiff of Belgium, Slykhuis, Marcel Hansenne of France, and Eric Ahlden and Ingvar Bengtsson of Sweden, took part in the U.S. indoor season. Tuskegee institute retained the women’s National A.A.U. outdoor championship. Mrs. Nancy Phillips of New York won both the high and long jump events in the National A.A.U. indoor games.

ATOMIC ENERGY. On Sept. 23, 1949, it was announced officially in London and Washington that evidence of an atomic explosion in the U.S.S.R. had been obtained. A few days later, the Moscow press referred to these announcements and connected them with “blasting by the most modern methods.” In October, A. Y. Vyshinsky confirmed the U.S.S.R.’s possession of atomic weapons and gave a reminder that V. M. Molotov had stated in 1947 that the secret no longer existed. The tone of British comment on this development was sober. The news was not exactly a surprise; for it had been said many times by competent authorities that the basic principles of atomic weapons were no secret and that the technology could be mastered by any nation able to draw upon substantial scientific skill and large industrial resources. There were some queries both in parliament and outside about British progress, but generally there was more emphasis on the political than on the technical aspect of the situation. As regards the methods by which the western powers had obtained the information on which their announcement was based, it could only be learned that collaboration between observers in various countries was involved. It had long been recognized that the radioactive materials generated in an atomic explosion could be windborne to great distances and that methods of extreme sensitivity could be used to detect them; for example, an article in the Physical Review (vol. 76, pp. 375-380) gave strong evidence for the detection in Iowa of radioactivity from the 1945 test explosion in New Mexico, 1,000 mi. away.

There are three scientific methods of detecting an atomic explosion. The ground vibrations are revealed by seismographs. The air vibrations can be recorded by the microbarograph, an ultra-sensitive barometer which detects minute and sudden changes in atmospheric pressure. The radioactive cloud, which drifts with the wind, can be detected by Geiger counters and similar instruments. When the first Bikini bomb was set off, evidences of the radioactive cloud were recorded 10 days later by Geiger counters on the Pacific coast of the United States.

British Technical Developments. At the Ministry of Supply’s Atomic Energy Research establishment at Harwell, Berkshire, the second and more powerful uranium fission pile was brought into full operation early in 1949; from March onwards, it was in regular use for the production of radioactive substances for scientific and medical purposes. At about this time, it was announced that some plutonium had been extracted from the low-energy pile, which had then been in operation for more than a year. A large part of the new radiochemical laboratory was completed and taken into use during the year. This laboratory was of very advanced
design and was fully equipped for chemical operations with substantial amounts of radioactive material. Extreme precautions were taken against the personal hazards involved in such work and against the spreading of radioactive contamination to other parts of the establishment.

At Sellafield, Cumberland, constructional work for still larger piles went on; it was understood, though never officially announced, that three such piles were to be built and that they would be capable of producing substantial quantities of plutonium. According to reports in The Times of Dec. 5 and 6, the building for the first pile was complete, that for the second was going up but the programme for the third pile had been cancelled for financial reasons.

A large frequency-modulated cyclotron was given a successful first trial at Harwell in December. Cyclotrons are research tools and not generators of atomic energy, and are machines for setting atomic nuclei in motion with extremely high speeds. The field of a powerful electromagnet causes the nuclei, which are electrically charged, to pass repeatedly across the gap between two metal electrodes within a vacuum chamber; a high-frequency alternating voltage between these electrodes is so arranged that at each time the nuclei cross the gap they are given additional speed. If, for example, they cross the gap 2,000 times and at each crossing are speeded up by 50,000 volts between the electrodes, their final speed will correspond to 100 million volts.

So long as the speed attained is only a small fraction of the speed of light, the frequency of alternation of the voltage between the electrodes can be kept constant; but to reach the highest possible speeds the principle of frequency-modulation (changing the frequency of the alternating voltage as the group of nuclei gains speed) is necessary. The Harwell cyclotron was the first frequency-modulated cyclotron constructed in Britain; on its trial, it accelerated hydrogen nuclei to 160 million volts. Nuclei moving with such speeds (roughly half the speed of light) can cause a wide variety of changes when they collide with the nuclei of other atoms.

Three smaller cyclotrons already existed in British universities; and a still larger one was under construction at the University of Liverpool.

Relations with Canada and the United States. A conference on the hazards associated with the operation of fission piles was held at the Harwell establishment in September; it was attended by U.S. and Canadian representatives and was an example of the co-operation, in certain aspects of atomic energy work, that had been maintained between the three countries since the end of World War II. This collaboration, including a system for controlling the release of information obtained jointly during World War II and arrangements concerning the supply of essential raw materials, was under review during the year; the agreement on the supply of Canadian uranium to the U.S. was understood to expire at the end of 1949, but it was expected that arrangements would be made for future U.S. purchases of this material. Reports were current that the agreement on the exchange of scientific and technical information about atomic energy, which covered only limited portions of the subject, might be renewed in a wider form and might be linked with a concentration of large-scale developments on the North American continent.

Sources of Uranium within the Commonwealth. Preparations for the mining of uranium in Australia continued and it was expected that substantial yields would be obtained in 1950. The possibility that South Africa might become an important source of uranium was brought to mind by the announcement of discussion in Johannesburg on uranium production, in which British and U.S. representatives took part. There was, however, no indication of how these deposits of uranium in the southern hemisphere might compare with the very rich ones in Canada. (P. B. M.)

United Nations. All attempts during 1949 to resolve the fundamental differences of opinion between the majority of nations in the United Nations and the Soviet bloc on the international control of atomic energy failed.

On Nov. 4, 1948, the United Nations general assembly, meeting in Paris adopted by a vote of 40 to 6 a four-fold resolution which (1) approved the plan of international control outlined in the three reports of the United Nations Atomic Energy commission, (2) expressed deep concern over the impasse in the commission, (3) requested the representatives of the five great powers and Canada to initiate private conversations in an effort to end the impasse and (4) called on the commission to resume its deliberations.

The majority plan was based on the premise that a mere agreement outlawing the atomic bomb would be insufficient. The plan would create an international control agency which would have ownership or managerial control of the production of uranium, the manufacture of fissionable materials and all atomic activities potentially dangerous to world security. It would have the power to license, control and inspect all other atomic activities. The agency would be empowered to create an international inspection service, make aerial surveys, maintain guards and otherwise take precautions to prevent clandestine operations. It specified that the veto power vested in the Security council of the United Nations would not apply to the control agency.

In accordance with the directive of the general assembly, the United Nations Atomic Energy commission resumed its meetings on Feb. 18, 1949. It became apparent almost immediately that the U.S.S.R. delegation had no intention of withdrawing from the position it had taken during the previous three years. On July 29 the commission voted to suspend its work indefinitely. The vote, following the characteristic pattern of previous years, was 9 to 2 with the U.S.S.R. and the Ukraine casting the negative votes.

Six-Power Conversations. Following the adjournment of the United Nations Atomic Energy commission, the five great powers and Canada initiated the private conversations requested by the general assembly. These six powers, the U.S., U.S.S.R., Great Britain, France, China and Canada, were the permanent members of the Atomic Energy commission and were known as "the sponsoring powers." The first meeting was held behind closed doors at Lake Success, New York, on Aug. 9, 1949.

The new atom landscape as seen by Illingworth in the "Daily Mail" (London) after the announcement on Sept. 23, 1949, that an atomic explosion had occurred in the Soviet Union.
On Oct. 26, after 11 secret meetings, the six powers made an interim report to the general assembly. It revealed that no progress had been made. At the same time all the powers with the exception of the U.S.S.R., issued a joint statement explaining their objections to the Soviet proposals. The statement summarized "three basic obstacles in the way of agreement." These were the proposals of the U.S.S.R. that (1) nations should continue to own explosive atomic materials, (2) nations continue to own, operate and manage facilities making or using dangerous quantities of such materials, and (3) a system of control be adopted depending on periodic inspection of facilities the existence of which the national government concerned has reported to the international agency, supplemented by special investigations on suspicion of treaty violation. The five powers believed that these proposals were insufficient to prevent the sudden or clandestine diversion of atomic materials to purposes of war.

The General Assembly. While the six-power secret talks were in progress, the debate over the control of atomic energy flared out again in the United Nations general assembly. In several addresses the Soviet foreign minister, A. Y. Vyshinsky, accused the U.S. and Great Britain of plotting an atomic war. Sharp exchanges took place between Vyshinsky and the representatives of the U.S., Great Britain and Canada. In a letter to the six powers, Carlos P. Romulo, president of the general assembly, suggested possible compromise solutions, in order to break the deadlock.

An address by Vyshinsky on Nov. 10 before the Special Political committee of the assembly was interpreted by most delegates as a final rejection of the majority plan. In the course of the address Vyshinsky said that the U.S.S.R. was utilizing atomic energy for its economic needs in its own economic interests.

On Nov. 14 the Special Political committee by a vote of 48 to 5 adopted a resolution introduced by France and Canada calling on the six sponsoring powers to continue their private talks in an attempt to solve the problem. The five negative votes were those of the Soviet bloc.

Early in Dec. 1949 General A. G. L. McNaughton, Canada, chairman of the United Nations Atomic Energy commission, in keeping with this resolution asked General Carlos P. Romulo and Sir Benegal Rau to submit new proposals on the control of atomic energy. Replying on Dec. 16, Romulo suggested that the search for a permanent solution be suspended for a few months and an attempt made to arrive at a short-term interim agreement.

United States. The U.S. stockpile was believed to contain more than 100 bombs although the true figure was one of the nation's most carefully guarded secrets. An immediate effect of the atomic explosion in the U.S.S.R. was to accelerate the U.S.'s programme. On Oct. 18 President Truman authorized the U.S. Atomic Energy commission to draw on its budgetary reserve for funds to begin a major expansion of its production programme. Soon after, congress rushed through legislation to relax the curb it had placed on the commission's spending powers in July 1949. Under the new legislation, the commission could start construction of unbudgeted facilities if it satisfied the director of the budget that they were necessary for national defence.

New Eniwetok Tests. On Nov. 29, 1949, the U.S. Atomic Energy commission announced that a new series of tests of atomic weapons would be held at Eniwetok atoll in the Marshall Islands in 1950. The assumption was that a new and yet more powerful bomb was ready for testing. The field operations were to be carried out by joint task force 3, representing the army, navy, air force and Atomic Energy commission.

The Ultimate Weapon. Scientists believed that the ultimate weapon would be a rocket powered by atomic energy, capable of crossing an ocean or the arctic regions, and carrying an atomic bomb in its nose. However, they believed that before that day arrived, there would be rockets of the familiar V-2 type capable of delivering atomic bombs.

Three-Power Conference. Considerable interest was aroused by a secret meeting called by President Truman at Blair house, Washington, D.C., on the evening of July 10, 1949. It was attended by the secretary of state, secretary of defence, the temporary chairman of the joint chiefs of staff, the chairman of the U.S. Atomic Energy commission and a group of congressmen representing the foreign affairs, military and atomic energy committees. It was later disclosed that the meeting had been called to discuss relations of the United States, Great Britain and Canada in the field of atomic energy. It was understood that the British government had requested secret data from the United States. The situation was clarified on July 28 when President Truman announced that the three nations would hold exploratory talks on the question of sharing atomic information and allotting supplies of uranium ores. The three-power conferences began in Washington on Sept. 20. The expressed purpose of the conference was to consider establishing a partnership for the joint utilization of materials, techniques and knowledge in the field of atomic energy.

U.S. Atomic Energy Commission. Chief emphasis was placed on the development and production of atomic weapons and of the fissionable materials required for their manufacture. Increasing attention was given to the design of new types of nuclear reactors. The research programmes in the physical, biological and medical sciences were expanded, and important additions were made to the commission's laboratories.

The improved atomic bombs tested at Eniwetok in 1948 were put into production during 1949. Component parts were produced on an industrial basis by manufacturing concerns with special government facilities. In collaboration with the U.S. geological survey, the commission continued the examination of virtually every rock formation in the country for uranium ores. Fissionable materials were produced in 1949 in greater quantities than ever before. Increased shipments of ore from Canada and the Belgian Congo were supplemented by domestic production. The chemical and metallurgical plants which converted ore into "feed materials" for the Oak Ridge, Tennessee, and Hanford, Washington, plants, were put on a sound operating basis. Unit production costs were reduced 30% below the 1947 level and intermediate stock piles were built up to adequate levels.

Installation of new equipment and improvements in operating technique reduced the cost of producing uranium 235 in the gaseous diffusion plant at Oak Ridge by 50%. In addition, the yield from a given amount of uranium was increased. Improvements in the operation of the Hanford plutonium plant increased by 40% the amount of plutonium produced per dollar of operating cost. A new uranium pile for the production of plutonium and a new plutonium metal fabrication plant began operations at Hanford in 1949. Construction work was started at Oak Ridge on a $67 million expansion of the plant for the production of uranium 235.

The "Breeder" Reactor. On Nov. 28, 1949, L. R. Hafstad, director of the division of reactor development of the U.S. Atomic Energy commission disclosed that the final work was being done on the design of a "breeder" nuclear reactor, a uranium pile that would produce more fissionable fuel in the form of plutonium than it consumed in the form of uranium 235. He described this reactor as the greatest peacetime development in the history of atomic energy and said that it was hoped to build the device during 1950 at the Nuclear Reactor Testing station near Arco, Idaho.
On Dec. 13 Hafstad revealed that his division was also working on another reactor of revolutionary design, a so-called homogeneous reactor. This device would employ nuclear fuel in a constantly circulating liquid form instead of a solid form. It was anticipated that this would eliminate the difficulty of removing the fission products, the nuclear "ashes" which clogged up the reactor.

Research on a type of reactor suitable for ship propulsion was being carried on by the Argonne National laboratory near Chicago, Illinois, and by the Westinghouse Electric Corporation.

An "intermediate power breeder reactor" which would generate power as well as breed some additional fuel was being designed at the Knolls Atomic Power laboratory near Schenectady, New York. A reactor for research purposes, nearing completion at the Brookhaven National laboratory, Long Island, New York, was expected to begin operation in 1950.

Radioactive Isotopes. An average of 400 shipments per month of radioactive isotopes was made during 1949 from Oak Ridge to laboratories all over the United States and to 27 other countries. The use of radioactive isotopes was constantly increasing. Physicians and biologists were using them as "tracers" to follow complicated biological processes in living organisms; to investigate the formation of the blood and body secretions; to understand the physiological action of hormones, vitamins and drugs; to delineate the changes in such diseases as diabetes, heart disease and kidney disease; and to follow the growth and death of cancer cells. An important development was the experimental use of radioactive cobalt as a substitute for radium in the treatment of cancer.

The division of biology and medicine of the commission was carrying on an extensive programme to investigate the effects of radioactivity on living organisms and to devise safeguards.

New Atom-Smashers. Two particle accelerators or atom-smashers of gigantic proportions were under construction by the U.S. Atomic Energy commission. They would dwarf the 184-in. cyclotron at Berkeley, California, which was, in 1949, the largest in the world.

At Brookhaven scientists were building a proton synchrotron which had been named the cosmotron. It would impart energies of 2,000 million to 3,000 million electron volts to subatomic particles. An even larger proton synchrotron, the bevatron, was being built at the Berkeley Radiation laboratory. It would develop 5,000 million to 7,000 million e.v.

Smaller atom-smashing devices were completed or were nearing completion at the Brookhaven, Argonne, Oak Ridge and Los Alamos laboratories. In addition the commission was financing researches in the physical sciences in more than 50 university and industrial laboratories.

Congressional Investigation. On May 22, 1949, Senator Bourke B. Hickenlooper, former chairman and ranking Republican member of the congressional joint committee on atomic energy, issued a statement charging David E. Lilienthal, chairman of the U.S. Atomic Energy commission, with "incredible mismanagement" and demanding his resignation. Hearings were held before the congressional joint committee on atomic energy. The committee brought in a majority and a minority report in October, splitting on straight party lines. The majority report held that all of the charges had been satisfactorily answered and, moreover, that the commission had done an exceptionally fine job of administering the atomic energy programme. The minority report virtually ignored the subject matter of the hearings and, taking a new tack, raised a new issue, charging the commission with hesitation and insufficient boldness in initiating a major development programme. On Nov. 23, 1949, Lilienthal tendered President Truman his resignation as chairman of the U.S. Atomic Energy commission, to take effect in Feb. 1950.

U.S.S.R. It was impossible, of course, to say what point the U.S.S.R. had reached in its atomic programme. U.S. observers were inclined to discount the claim that the U.S.S.R. had had the bomb since 1947. It was known, however, that the U.S.S.R. had been operating the Czech, Austrian and Saxon pitchblende mines at a feverish rate. The U.S.S.R. was reported to possess uranium deposits in the Tashkent area in the central Asian region of the Soviet Union; in the Ossetia area, north of Tiflis; in Svanetia in northwestern Georgia; in the region between Samarkand and the Ferghana mountains; in the Alai mountains in Turkestan; and in the Kara-Mazar mountains, north of Khodzhent.

Reports circulating in western Europe stated that the U.S.S.R. had created a large underground factory for processing uranium on the Sanga river, a few miles north of Erivan, capital of the Armenian S.S.R. Information received by the U.S. state department indicated that the U.S.S.R. had deported more than 17,000 Greeks and other non-Russians from the Caucasus area since June 1949. It was believed that the U.S.S.R.'s atomic bomb explosion occurred in this area.

ATTLEE, CLEMENT RICHARD, British statesman (b. London, Jan. 3, 1883), became prime minister in July 1945 when the Labour party achieved a majority in the House of Commons. (See Britannica Book of the Year, 1949.)
AUCKLAND—AUSTRALIA

In April 1949 he presided over the second meeting within a year of the Commonwealth prime ministers; and in January he held talks with Sir Basil Brooke (q.v.), prime minister of Northern Ireland. In March he flew to Germany where he saw the Berlin air lift and had discussions with Western German political leaders. He attended the Labour party conference at Scarborough in June, at which the party's election programme Labour Believes in Britain was approved, and on Sept. 7 addressed the Trades Union congress at the Hall of Memory, Manchester. In the autumn there was widespread feeling that he would dissolve parliament and call a general election, but on Oct. 13 he issued a statement declaring that he would not recommend the King to dissolve parliament in 1949. During the parliamentary recess he paid visits to the armed forces: in August he visited the Royal Navy and made a descent in a submarine; in October he visited the Royal Air Force and also the United States Air Force at Marham, Norfolk; and later in the same month he watched infantry training and a training regiment of the Royal Engineers near Aldersholt, Hampshire. During the absence of senior cabinet members during August and September—Sir Stafford Cripps (q.v.), because of illness and later in Washington, Ernest Bevin (q.v.), on holiday, at Strasbourg and later in the United States, and Herbert Morrison, lord president of the council, at Strasbourg—he undertook control of their departments. He again acted for the foreign secretary in December when Ernest Bevin was on leave. In April he received an honorary degree from the University of Wales, and on Oct. 12 he laid the foundation stone of the concert hall on the south bank of the Thames.

AUCKLAND, the largest city in New Zealand and a thriving seaport on the east coast of the North Island; capital of the province of its name. Pop., city and suburbs (Sept. 1948): 329,500, Mayor, J. A. C. Allum. Within the metropolitan area of approximately 70 sq. mi., in which there are 15 contiguous but independent municipal authorities each with their own officers (including mayor and borough councillors) and accounts, the total revenue (March 31) was £6,890,246 and expenditure £6,666,798. The provisional total cargo handled in the Port of Auckland in the year ended Sept. 30, 1949, was little different from 1948 (2,635,219 tons), in spite of the loss of over 72,000 man-hours when watersiders refused overtime work as a protest against a wage decision by the Waterfront Industry authority and in support of a nation-wide carpenters' strike. Of the man-hours lost throughout New Zealand 76% were lost in Auckland.

Building controls curtailed the erection of other than private dwellings but some leeway in the severe housing shortage was made up.

The establishment of the first annual Music Festival was of cultural importance; and performances were given by national and local groups and single performers. The Italian Grand Opera company visited the city and played several operas. There was an exhibition of early British watercolours arranged by the Empire Art Loan Exhibition society. The number of boats competing in the 99th yachting regatta in Waitemata harbour—over 500—was a world record for a one-day regatta.

Major bequests included £30,000 by Mr. Hallyburton Johnstone to an Auckland girls' home; and £59,000 by Mr. Goldwater for the foundation of a Jewish educational institution. (R.W. B.)

AURIOL, VINCENT, French statesman (b. Revel, Haute-Garonne, France, Aug. 27, 1884). On Jan. 16, 1947, he became the first president under the constitution of the Fourth Republic. (For his early career see Britannica Book of the Year 1949.)

Speaking at Tours, on May 7, 1949, he said that France remained convinced that there would be no lasting peace and prosperity without an association of national sovereignties. On May 29, 1949, he arrived at Algiers on the first presidential visit since that of Gaston Doumergue in 1930 and during his stay visited Bone, Oran, Constantine and Tiemcen. He said that those who thought Algeria could dispense with French sovereignty were madmen.

AUSTRALIA, COMMONWEALTH OF. A self-governing member of the Commonwealth of Nations, situated in the southern hemisphere. Areas and populations of the six federated states, of the Northern territory and the Australian Capital territory are:

The total population figure excludes full-blood aboriginals estimated at 47,000; half-castes numbered 24,881 in 1944. About four-fifths of the Australian continent is a hot, dry desert, virtually empty of population. Most Australian settlement is confined to three areas; on the eastern and southeastern coastal plains; on the eastern plateau; and on and near the southwestern coast. Territories under the administration of the Commonwealth but not included in it comprise Papua (q.v.), Norfolk Island, the trust territory of New Guinea, Nauru, the territory of Ashmore and Cartier islands, and the Australian Antarctic territory.

Chief towns (pop., June 30, 1947): Sydney (q.v.) (1,484,434); Melbourne (q.v.) (1,226,923); Brisbane (402,172); Adelaide (382,604); Perth (272,586); Newcastle (127,188); Hobart (76,567). Language: English. Religion: Christian (census 1933: Anglican 2,565,118; Roman Catholic 1,161,455; Presbyterian 713,229; Methodist 684,022; other Christians 603,914); Jewish 29,600. Ruler, King George VI; governor general, William John McKell; prime ministers in 1949, Joseph Benedict Chifley (q.v.) and, from Dec. 18, Robert Gordon Menzies (q.v.).

History. The main event of the year was the general election held on Dec. 10. (See Elections.)

Several decisions of the High Court given during the year had a profound effect on public life and on the relations between Commonwealth and the states. The High Court held that the Commonwealth no longer had the power to ration petrol. As a result, petrol was de-rationed; but as the Commonwealth largely depended on dollar area imports, a severe shortage developed. The petrol question displaced the Bank Nationalization act, 1947, as a major election issue. The Privy Council upheld the High Court in declaring vital sections of the Bank Nationalization act invalid. (See Banking.)

Following the failure of the referendum on price control, collaboration between the six states was reasonably successful, although the cost of living continued to rise. Price controls on a number of commodities were removed.

Social service expenditure for 1948-49 at under £81 million remained below the estimate, mainly because of the protracted struggle between the Commonwealth government and the British Medical association over the Pharmaceutical Benefits scheme. Under instructions from the B.M.A., the vast majority of doctors refused to issue free prescriptions on Government forms. The B.M.A. successfully challenged the act before the High Court, which by a majority held that the compulsion for doctors to use Government prescriptions and forms was an unconstitutional "civil conscription." The wider National Health Service act, passed in 1948, was not implemented.

The minister for external territories, E. J. Ward, was cleared of charges of corruption by a judge of the Supreme Court of South Australia functioning as royal commissioner.

Communism. Politically, the increased tension between the Communist movement and the rest of the community was the outstanding development. The Victorian government appointed a royal commissioner to inquire into Communist activities in industry, education and other fields. A coal strike lasting from June 27 to Aug. 15 affected practically all hard coal mines in the country and paralysed the industrial life of the country. It arose out of the decision by the Communist-dominated executive of the Miner's federation not to await the decision of the Coal Industry tribunal on a claim for long service leave. The strike was clearly political in character. The Commonwealth parliament reacted by passing an act prohibiting the payment or receipt of money for the continuance of the strike. The Commonwealth Arbitration court was given power to grant injunctions for the purpose of preventing breaches of the act. When leaders of the Miner's federation and other unions refused to disclose the use of their funds, they were sent to prison for contempt of court; they were released after the collapse of the strike and after having apologized to the court. The Commonwealth also used troops to work open-cut mines. The strike collapsed completely without any new concession being obtained by the miners. The Coal Industry tribunal later awarded long service leave, subject to certain penalties for the disruption caused by the strike. The general secretary of the Communist party, Laurence Sharkey, was sentenced to three years' imprisonment—the maximum term—for a seditious utterance in regard to the attitude of Australian workers in the case of war between Australia and the U.S.S.R.

Immigration. The flow of immigrants increased vastly during the year. With more liners and migrant ships coming into service, the numbers of both British and continental European migrants were rising steadily; 75,000 immigrants arrived in the first six months, and the 50,000th migrant from continental Europe, a Latvian girl, was officially welcomed on Aug. 12 by A. A. Calwell, minister for immigration.

Non-British migrants were housed in reception camps, from which they went to employment, mainly in farming, forestry, nursing services and industry. After a minimum period of two years they were to be free to choose their own occupations.

The government rigidly adhered to its exclusion of non-white immigrants, a policy for which the term "White Australia" was officially discarded. Much public and international controversy was aroused by some actions of the minister for immigration, who deported or threatened to deport an Indonesian wife of an Australian, with a number of Australian-born children, a Chinese farmer established for 20 years in Queensland and forbade the temporary entry of a U.S. army sergeant of Philippine descent for a visit to his Australian wife. To the last-mentioned action, the Philippine government reacted by retaliatory measures.

In 1948-49, 52,573 new houses were completed; but the coal strike affected building in the second half of the year.

External Affairs. Dr. Evatt was a very active president of the third session of the general assembly of the United Nations. Australian representatives were active in supporting the recognition of the new state of Israel, and the sovereignty of the new republic of Indonesia. Australia sent an official observer to the Conference of Asian Nations convened by the Indian prime minister at New Delhi, which strongly condemned the Dutch police action in Indonesia. Australia also took a lead in demanding U.N. investigation of the trial of religious leaders in Hungary and Bulgaria. As one of the main wheat-exporting countries, Australia ratified the important International Wheat agreement between more than 40 countries which assured guaranteed minimum quantities of wheat from a small number of exporting countries to a large number of importing countries, at maximum and minimum prices fixed in the agreement. Australia continued to contribute generously to international relief organizations, in particular to the International Children's Emergency fund.

Commonwealth affairs were of outstanding importance during the year. In April, J. B. Chifley attended the conference of Commonwealth of Nations prime ministers in London, which resulted in a declaration that the republican status of India was compatible with continued membership of the Commonwealth. A few months later, J. J. Dedman, minister for post-war reconstruction, attended in London a conference concerning the financial crisis of Great Britain and the sterling area (see below). The Australian Nationality and Citizenship
act, 1948, came into force on Jan. 26, 1949. It was the first to recognize officially Australian citizenship.

Defence. Expenditure for defence services was £61 million, slightly above estimates. Expenditure for total war and reparation services at nearly £150 million was considerably above estimates. Corresponding estimates for 1949-50 were £60 million and £121 million. A new aircraft carrier, H.M.A.S. "Sydney," joined the fleet. The most important naval manoeuvres after World War II were held by the joint Australian and New Zealand navies in October. Further progress was made on the guided missiles project in South Australia. On the retirement of Lieut. General V. A. H. Sturdee, Lieut. General S. F. Rowell was appointed chief of the army staff.

Finance and Economics. The Budget was balanced at £535 million. National income rose by 12% to a new record of £1,955 million, nearly 24 times the prewar figure. The income of primary producers still showed by far the greatest proportional increase, as the exceptional world demand for wool at very high prices continued through the year. Substantial price rises accounted for an increase of the "C" rate index of retail prices by nearly 9%, between Sept. 1948 and Sept. 1949.

Exports of merchandise and gold rose to £536 million as against imports of £415 million. Australia's international balance of payments resulted in a surplus of £41 million, but the prime minister gave grave warning of the dangers to Australia's prosperity that would follow from a world depression and from the dollar crisis of the sterling area. To safeguard against a slump, Australia maintained a large sterling balance estimated at over £400 million in London. The government made another gift of £10 million to the United Kingdom. Australia followed the devaluation of the British pound, thus maintaining the ratio of 4 British to £5 Australian. Australia agreed to cut her dollar imports by 25% and in October obtained a loan of £20 million from the International Monetary Fund.

Of many industrial development plans, the official start of the Snowy River Power scheme, which would provide a large proportion of Australia's power and conserve water for irrigation in the Murray and Murrumbidgee valleys, was the most important.

Despite substantial immigration, there was still labour and material shortage in almost every industry. About 30,000 new immigrants were absorbed in national production. Full employment was maintained. The Commonwealth Court of Arbitration was, for the second part of the year, mainly engaged in taking evidence on a trade union claim for a basic minimum wage of £10.

The Arts. The shortage of paper almost entirely disappeared but publication of Australian books continued to suffer from Board of Trade regulations made in connection with the U.S. loans. There was a steady stream of distinguished visiting artists from many countries, including the conductors Rafael Kubelik and Otto Klemperer, the Shakespeare Memorial Theatre company from Stratford-on-Avon, the pianists Wibold Malcuzyński and Alessandro Hellman, and the singers Joan Hammond, Elizabeth Schwarzkopf and Ninon Vallin. (W. Fr.).

Education. (1945) State schools 8,447, pupils 726,440, teachers 31,061; private schools 1,817, pupils 249,024, teachers 11,799; technical schools 131, teachers 517; business colleges 1,019, pupils 23,270, teachers 659; universities (1947) 8, students 30,477, professors and lecturers 2,141.

Agriculture. Main crops in '000 metric tons, 1947-48; 1948-49 in brackets: wheat 5,985 (5,162); oats 738 (540); maise 159 (152); barley 472 (450); sugar cane (raw value) 613 (930); potatoes 501 (569). Livestock (in '000 head, March 1948) sheep 102,559, cattle 13,785; pigs 1,255; horses 1,165. Wool production (in '000 metric tons, greasy basis, 1947-48; 1948-49 in brackets) 460 (490). Food production (in '000 metric tons, 1947-48; 1948-49 in brackets): butter 159-6 (163-9); cheese 42-1 (44); meat 962-2 (987-1) of which beef 371-1 (584-7).

Manufacturing (1948). Manufacturing establishments (1948) 13,052 (12,973); persons employed 848,872. Fuel and power (1948; 1949, six months in brackets) coal (in '000 metric tons) 15,059 (7,114); lignite (in '000 metric tons) 6,792 (3,622); manufactured gas (in million cu. metres) last six months 1948 529 (557); 1949 528 (555). Raw materials (1948; 1949, six months, in brackets) gold (in '000 fine oz.) 890, (448); pig-iron (in '000 metric tons) 1,155 (509); copper (in '000 metric tons) 13 (6); lead (in '000 metric tons) 196 (104); zinc (in '000 metric tons) 83 (416); tin (in '000 metric tons) 2 (0); pig and castings (in '000 metric tons) 1,236 (571). Employment in manufacturing (index 1937=100, 1948; 1949, six months in brackets) 158 (161). New capital investment in Australian manufacturing enterprises between Sept. 1948 and Mar. 1949 of which £41 million was for new enterprises and £103 million for expansion of established businesses. Industries which were being expanded included textiles and clothing, newspaper, agricultural machinery and implements, glass, plastics, industrial chemicals and building materials. Cement production (in '000 metric tons, 1948; 1949, six months in brackets) 1,004 (527). Building bricks (in millions, 1948; 1949, six months in brackets) 577 (296).

AUSTRALIAN LITERATURE. The Commonwealth Literary fund's fellowships for 1949 reflected current interest in the Australian historical background. Works commissioned by the fund included: a historical work on the pastoral industry by Judith Wright; a novel by John Morris, set mainly on the Melbourne waterfront; a novel of Australian life and progress and a poem of "epic proportions" telling of the discovery of the Great Southland, both by Rex Ingamells; and the completion by Eric Lowe of the fifth and sixth of his novels covering the story of land settlement from 1812-1938. Much of the work published during the year also went to history for its source. There was, for example, Frank Clune's Wild Colonial Boys, Eleanor Dark's Storm of Time, and C. B. Christensen's Australian Heritage which, like A. P. C. F.'s Australian Muster (1946) sought by literary selections to define the Australian way of life. Two biographies combined literary history with literary criticism. The one, Nette Palmer's Fourteen Years, selections from a journal kept between 1925 and 1939, covered practically everything of significance in Australian and New Zealand writing during those years. The other, Story Book Only, came from Hugh McRae, and gave a selection of all he considered worth preserving of his prose writings over some 50 years. Percival Serle's two-volume Dictionary of National Biography filled a long-neglected need, both of literary and general reference.

Among novels of note published during the year were: Vance Palmer's Golconda, written about a silver-lead mine in Queensland; Lawson Gossip's Lucky Palmer, a tale of racing, betting and bad luck; Pathway to the Sun by E. V.
AUSTRIA. A republic in central Europe. Area: 32,388 sq. mi. Pop.: (March 1938, est.) 6,754,000; (Oct. 1948, est.) 6,653,000. Language: German 98%, other 2% (mainly Slovene in Carinthia). Religion (1939): Roman Catholic 88-27%, Protestant 5-35%, Jewish 1-26% (0-2% in 1945), others 5-12%. Chief towns (pop., June 1948 est.): Vienna (q.v.) (cap., 1,730,613); Graz (226,229); Linz (184,336); Salzburg (106,919); Innsbruck (98,561); Klagenfurt (65,930). President of the republic, Dr. Karl Renner; chancellor (prime minister), Leopold Figl (q.v.); minister of foreign affairs, Dr. Karl Gruber (q.v.). The Austrian government had jurisdiction throughout Austria, with certain limitations regarding matters control over which was reserved to quadripartite decision in the Allied Council for Austria. By Dec. 31, 1949, members of the A.C.A. were: France, General de Gaulle; Great Britain, Lord Jindyworobak; United Kingdom, Lieutenant General Sir Alexander Galloway (succeeded from Jan. 1, 1950, by Major General T. J. W. Winterton); U.S., Lieutenant General Geoffrey Keyes; U.S.S.R. (from May 1949), Lieutenant General V. P. Swiridov.

History. A return to normal political life was the salient feature of 1949 in Austria. The growing self-confidence of the coalition government under Chancellor Figl, which continued in office (with some changes) after the general election on Oct. 9, meant that, in practice, less importance than hitherto attached to the continuing failure of the Council of Foreign Ministers to reach agreement on a peace treaty—though government spokesmen did not miss any opportunity of raising their voices in protest against the servitude of the prolonged Allied occupation.

There was, indeed, during the year, a mitigation of Allied control in certain minor respects. From Jan. 1 the United Kingdom handed over to the Austrian authorities full responsibility for the control of the Austro-Italian frontier; in February airfields in the United States zone were restored to the Austrian government for agricultural purposes; a relaxation of the control over goods traffic between the Soviet and the western zones was announced by the Soviet authorities to take effect from May 25; and at a meeting of the Allied council on July 19 notice was given of the relinquishing of certain controls over Austria's posts and telegraphs administration. Finally, the council, without yielding on the principle that Allied approval was necessary for any addition to the three recognized political parties—People's party (Christian Social), Social Democrats and Communists—in fact attempted no interference with the formation of new parties. The new electoral law, indeed, which was approved by the Allied council on June 24, specifically provided that any electoral group that could muster 100 supporters was entitled to put up candidates in the general election.

The meetings of the foreign ministers' deputies were resumed (for the sixth time in three years) on Feb. 9 in London. The Soviet deputy at once brought up again the territorial demands and claims for reparations of Yugoslavia—which provoked the Austrian government into a fresh assertion that Austria would not accept any treaty involving loss of territory or the creation of an autonomous zone for the Slovenes of Carinthia. The Yugoslav delegate, Dr. A. Bebler, was given a hearing, but his "compromise" proposals were not acceptable to the three western powers. A similar deadlock developed over the reparations issue, the compensation to the U.S.S.R. for those German assets to which a claim had been relinquished and the question of compulsory repatriation of displaced persons, etc. When the talks were adjourned on April 8, to enable the governments to be consulted, the western deputies made a significant gesture in abandoning all reparations claims in their zones, subject to the Austrian government assuming an obligation to liquidate all Reich German ownership of the German assets in question.

By the time the Council of Foreign Ministers itself met in Paris (May 23-June 20) the situation had been substantially eased by the abandonment by the Soviet government of support for Yugoslavia's territorial claims. The ministers agreed that, while no reparations should be exacted, Yugoslavia should retain all Austrian property rights and interests within Yugoslavia; that the U.S.S.R. should receive from Austria (1) $150 million in freely convertible currency to be paid within a period of six years, (2) the assets of the Danube Shipping company in Bulgaria, Hungary and Rumania as well as eastern Austria, (3) concession rights to oil production areas equivalent to 60% of Austrian oil production, as also to 60% of all exploration areas in eastern Austria which come in the category of German assets, and that, in return, the U.S.S.R. should relinquish all property, interests or rights held as German assets or war booty, with the exception of the oil and shipping assets previously conceded. But the deputies were unable to compose their differences in the time allotted (by Sept. 1), and the negotiations were taken up again by the ministers in New York on Sept. 23.

In internal politics the Social Democratic party made the
AVIATION, CIVIL

running, with the Communists unable to make any real impression on the emphatically "western" orientation of the country. The party executive tabled a resolution, in May, calling for revision of the Allied Control agreement in order to secure greater freedom of action for parliament and government, total abolition of the censorship, the reduction of occupation forces to token level and the removal of zonal frontiers. Relations with the Austrian People’s party became more acrimonious in the middle of the year, triggered by the latter’s reputed electoral bargaining with certain prominent ex-Nazis, and on July 13 a bill for a further amnesty for certain groups of incriminated Nazis, which had been sponsored by the People’s party, was defeated in parliament. But the makers of Socialist policy made it clear that they had no intention of breaking up the coalition before the general election; and, in the end, both the principal parties pledged themselves to its continuance, whatever the outcome of the polling.

In the event the election produced little change in the balance of parties. The People’s party won 77 seats, the Socialists 67, the Communists 5 and the Independents 16 (see also ELECTIONS). This represented a loss of 8 seats by the People’s party and 9 by the Socialists. The Communist gain of 5 seats was chiefly on account of the defection of a left-wing Socialist leader, Erwin Scharf, who set up a Left bloc shortly before the elections.

In February an occupation costs levy was imposed to defray the outstanding costs for 1948. On March 24 a Four Years’ plan for Austrian agriculture was issued, to be operated within the framework of the European Recovery plan. (The outlay was estimated at Sch. 4,900 million, financed largely by the farmers themselves.) On May 8 the government announced its programme of financial consolidation to replace the wage-price agreement of Sept. 1948. Trade agreements were made with Italy, Hungary (under U.S. auspices) and Germany.

Industry. Insured persons employed (Aug 1949) 1,978,000. Fuel and power (1948; 1949, six months, in brackets) coal (in ‘000 metric tons) 178 (943), lignite (in ‘000 metric tons) 3,336, natural and manufactured gas (in million cm cu metres) 398 (215), electricity (in million kWh) 4,213 (1,952). Raw materials (in ‘000 metric tons 1948; 1949, six months, in brackets) pig iron 613 (423); steel ingots and castings 648 (389). Manufactured goods (1948; 1949, six months, in brackets). cement (in ‘000 metric tons) 721 (465); leather shoes (in ‘000 pairs) 2,269.

ANNEX

AVIATION, CIVIL

Relatively little expansion occurred in European air transport during 1949. There were few new services and new types of aircraft were put into service; but business on the air lines generally improved. The Dutch and the Belgian lines (K.L.M. and Sabena) had a surplus on operations in 1948. Sabena appeared to have made a profit on the work of 1949. K.L.M. had its line to the east closed for two months and diverted for another five months by the closing of Pakistan to its aircraft, and, like the other major operators, showed a loss on the year. Yet almost without exception the European air lines were busier than they had been in 1948. As compared with 1948, passengers increased by 35% and aircraft movements were more than double. At London airport aircraft movements rose from 1,145 in Dec. 1948 to 2,423 in July 1949 and at Northolt, in the same months, the rise was from 1,319 to 4,565. These figures marked the peak of the holiday season but they also marked a big rise on the corresponding period of 1948. The general rise in the volume of traffic in 1949 seemed to have amounted to about 30%.

Competition for the improved traffic remained as keen as ever and was no doubt responsible for the failure in the early part of the year of an Anglo-American attempt to introduce the full freedom of the air for the whole of Europe outside the Russian-controlled areas. The proposal, sponsored by the United Kingdom and the United States, that the existing bilateral air agreements (including reciprocal rights of operation) should be replaced by multilateral arrangements (giving general freedom to operate commercial services) was rejected by a regional conference of the International Civil Aviation organization held at Geneva, Switzerland.

Authority to operate international services had, therefore, still to be sought by individual negotiation and countries were still inclined to make their air agreements depend on the conclusion of satisfactory bargains. This was beginning to be modified by pooling arrangements on certain routes. The United Kingdom had a pooling agreement with France before World War II on the route between London and Paris. A similar arrangement was reported in 1949 between K.L.M., Scandinavian Airlines System, the Czechoslovak line and one of the Italian companies on certain common routes. The precise terms of these agreements were not disclosed but their effect was expected to restrict some forms of competition as well as lead to some measure of co-operation.

Passenger fares, agreed by operators through their long-established International Air Transport association, remained steady at an average of 7½d. a mile on European routes. Throughout the year there was some pressure towards lowering freight rates and towards introducing lower passenger rates on non-regular services. Indirect competition by British charter companies, which were forbidden to operate regular services, had been checked partially by allowing a number of them to become "associates" of British European Airways, operating particular services under agreements specifying frequencies and fares. With the return of aircraft from the Berlin air lift, there was a renewal of the movement towards charter fares. One charter company, operating Tudor II and Tudor newborns, offered them at 50s. a mile, if all seats were filled, would represent 2d. to 3d. a passenger-mile. As the overheads of air line companies are not supposed to exceed 33% of total costs, this seemed to argue that fares should not be as high as 7½d. a mile even if air line companies assumed that, on the average, they could not expect to fill more than 60% of their aircraft capacity.

Great Britain. The two British corporations—Overseas Airways and British European Airways—were engaged in re-organizations designed to reduce overheads and to diminish the losses on their operations. In the middle of the year the smaller, third corporation, British South American
Airways, was amalgamated with B.O.A.C. This was a direct result of the ban put on passenger-carrying in Tudor I and Tudor IV aircraft after two had been inexplicably lost over the Atlantic. This left B.S.A.A. with an inadequate fleet and with no prospect of acquiring quickly other types of suitable aircraft. B.O.A.C. on the other hand had good aircraft prospects. Not only had it six Stratocruisers on order but it had succeeded in acquiring from Scandinavian Air Services the right to fly four more which were on order for that company. It had also taken over from the Irish company four additional Constellations; and it was expecting delivery of 22 Canadair Argonauts and 25 Hermes IVs. In the event, the deliveries of the Hermes IVs and the Stratocruisers were much delayed and B.O.A.C. was somewhat handicapped both in handling its own business and in providing for the services which B.S.A.A. had intended to operate.

British European Airways, equipped chiefly with Viking aircraft, had fully recovered from its early difficulties with this type and did good business during 1949. In the preceding financial year its losses were about £2,250,000. Improved traffic, combined with more economical management and maintenance, gave a much better outlook for the financial year ending in March 1950. The signs were that the deficit would be reduced by about £1,000,000. B.O.A.C., which lost £5,250,000 in 1948-49, had not begun to feel the benefit of its new aircraft and was not expecting to show large additional savings on the year 1949-50. This corporation had already made notable economies in administration and reduced its deficit by nearly £2,000,000 in 1948-49.

To fill capacity was the chief difficulty of air operators in a period of high fares and many competitors. Evidence of the competition was to be found in the fact that 17 international air companies used London airport regularly during 1949, although the daily passenger totals at that airport varied only between 600 and 1,000 and the daily freight loads between 20 and 25 tons. Standards of operation and the quality of the aircraft in use were becoming important factors in securing traffic as well as in economical running. During 1949 the first signs appeared of a probable British advantage on the air lines serving Europe. These arose from the successful application of the gas turbine to the needs of commercial air transport.

In all other countries except Canada, the gas turbine at its present stage of development had been considered unsuitable for commercial operation, largely on account of its high rate of fuel consumption. In the face of that prejudice, British and Canadian constructors had proceeded with the preparation of air liners using gas turbines both as the motive power for driving airscrews and as the means of providing jet propulsion. The disadvantage in fuel consumption per h.p.-hr. or per lb. thrust was admitted but a counter-argument based on cost per passenger-mile or on the probable return on capital invested was advanced by the aircraft manufacturers. Proof that this argument must be taken seriously

* Revenue

Source: Ministry of Civil Aviation.

was contained in the interest shown by United States operators when the first batch of gas turbine aircraft was exhibited during 1949. There were four liners of various sizes using gas turbines to turn their airscrews. These were the Vickers Viscount 40 to 53-seater, the Armstrong Whittworth Apollo 26 to 41-seater, the Handley Page Hermes V 48 to 74-seater and the Miles Marathon 16 to 20-seater. One jet liner, the de Havilland Comet 36-seater appeared in England and one, the Avro Jetliner 36 to 40-seater, in Canada. The designer of the Viscount produced figures to show that it could be operated as cheaply per passenger-mile, up to a maximum practical range of 900 mi., as a comparable piston-engine liner. These figures had yet to be tested in conditions of regular service, but early experience with liners of this type suggested that an additional economic advantage might be derived from the smooth running and relative absence of vibration in the rotary engine which is responsible for a large part of the cost of airframe and instrument maintenance. This fact impressed air line operators, first because of its probable attractiveness to passengers and also because of other economic implications. They were likely to cruise at speeds between 270 and 330 m.p.h. but they did appear to offer new standards of passenger comfort.

The one new liner which promised high speed was the Comet. A number of its long-range test flights were made at a speed of about 500 m.p.h. To obtain this speed it flew at heights between 36,000 ft. and 40,000 ft. If operators should decide to fly it at a lower level, the cruising speed might be 450 m.p.h. or less. Its value on a highly competitive route like that between Europe and America was so obvious that the appearance of the first Comet caused a stir among operators and aircraft manufacturers alike in the United States. Sixteen Comets were ordered, 14 of them for use by British Overseas Airways.

Some 40 Viscount turbo-prop liners were also ordered for use by the two corporations and these also were thought likely to go into service in 1953. Thus, although both corporations were still losing money on current operations, there was a good prospect of their leading the field in four years’ time. Alongside this were indications that B.O.A.C. expected good results from the 140-ton flying-boats which were being built by Saunders-Roe. This type too would use gas turbines to turn its airscrews and was expected to cruise at 380 m.p.h.

These signs of the re-entry of highly efficient British aircraft into the field which had been largely monopolized by United States aircraft led to some speculation during the year as to probable American reaction. Strong pressure was being applied during the latter part of 1949 to prevent the ordering of new British aircraft by United States lines at a time when they were extending their interests in Europe and on routes between Europe and the east. Pan-American Airways, which already had an interest in Turkey, obtained a 36% interest in the Lebanese-owned Middle East Airlines and in view of the proposed absorption of American Overseas Airways was likely to inherit exclusive operating rights in Saudi Arabia.

Canada. Trans-Canada Airlines handled a record volume of traffic on its domestic and overseas routes in 1949, carrying more than 690,000 passengers, an increase of 23% over 1948. Air cargo and air express were up 55%, totaling over 3-6 million ton-mi. Mail was almost double the 1948 total exceeding 3-9 million ton-mi. Financial results were not reported, but in 1948 T.C.A. showed a loss of about $3 million, 60% of which was on its overseas services across the Atlantic and to the Caribbean and 40% on domestic operations. The route from Montreal to Bermuda and Trinidad was flown once a week with Canadair 4’s. On Dec. 1, 1949, it was extended to Barbados.

Canadian Pacific Air Lines, which at first had been refused permission to operate international services and then had been awarded the trans-Pacific route, had negotiations under way at the close of the year to extend its services beyond Australia to Auckland, New Zealand. Altogether, there were eight private carriers in Canada authorized to operate scheduled services, three of which were reported to have shown profits. In addition, there were about 150 private operators whose gross revenues exceeded $10,000 a year.

Four Canadian aircraft manufacturing companies produced civil aircraft during 1949: the Canadian Car and Foundry Co. produced the Norseman; de Havilland, the Chipmunk and the Beaver; Candair Ltd., the "4’; and A. V. Roe Canada Ltd., the Avro C-102 Jetliner. The last named was the first jet-powered civil transport to fly in the western hemisphere.

United States. Scheduled air lines of the world, exclusive of the U.S.S.R., operated about 3,800 aircraft of all types at the end of 1949. Approximately three-fourths of all these transports were of U.S. manufacture. Aircraft produced in the United States carried about 90% of the world’s scheduled air traffic. Principal U.S. air line transport types in production at the year-end were the four-engined Boeing Stratocruiser, the Lockheed Constellation, the Douglas DC-6 and the twin-engined Consolidated Vultee 240 and Martin 2-0-2.

Throughout the world the DC-3’s and DC-4’s, largely war surplus equipment, were still the main work horses of the air lines, but in the United States air carriers were fast changing over to the more efficient postwar types of equipment. American Airlines, for example, retired the last of its prewar planes from passenger service during the first half of the year and by December was operating with 50 DC-6’s and 74 Convairs.

Scheduled American air carriers operated 1,083 planes on both domestic and international services by the end of 1949 and carried close to two-thirds of the world’s air traffic. The year 1949 was the busiest the air lines of the United States had experienced to date. An estimated 16-5 million passengers were carried a total of 8,800 million passenger-mi., representing about a 12% increase over 1948. Scheduled U.S. domestic and international air lines employed 78,500 persons in the autumn of 1949 and provided service to 705
U.S. cities, as well as their overseas points of call. It was estimated that the domestic lines were carrying 43% of the first class rail and air travel market in the U.S. in 1949 as against 39% in 1948 and only 13% in 1945.

The year 1949 witnessed the introduction of air coach travel on a wide scale. Irregular carriers, operating under exemption permits from the Civil Aeronautics board, had proved that lower fares and less emphasis on the usual air travel luxuries would attract many new passengers to air travel; and one by one the major certificated air lines entered the coach field. Pan American World Airways’ coach-type service between Puerto Rico and New York, inaugurated in the latter part of 1948, proved very popular during 1949 and the record disclosed little diversion of first class passengers to the new coach service. Capital Airlines’ initial coach service between New York and Chicago was an immediate success and by the last week of Dec. 1949 both American Airlines and T.W.A. (Transcontinental and Western Air) had begun low cost ($110) transcontinental coach service between New York and California. Many regarded the wide-spread introduction of coach service during 1949 as a significant step toward ushering-in an era of mass air travel. (See Table IV).

Substantial improvement in passenger and cargo traffic, increased mail pay and a reduction in unit operating costs through the installation of new postwar equipment and more efficient operations combined to produce the best revenue period since the war for U.S. carriers. Gross revenues increased about 13% over 1948, according to Air Transport association estimates, totalling $764 million in 1949, as compared with $678.9 million in 1948. Gross operating expenses were estimated at $720 million as against $662.6 million in 1948, resulting in a major increase in net operating income to over $44 million for 1949—an impressive improvement for an industry which was operating at a heavy loss only three years before. Of the total 1949 revenues, passenger traffic contributed about 72%, mail 18%, freight, express, excess baggage and other services making up the remaining 10%.

While the 14 feeder airlines experienced substantial income increases in all categories of traffic except mail during 1949, most of them were too new to be out of their initial developmental period. E. W. Wiggins Airways, for example, operating in New England, and Central Airlines in Texas and Oklahoma did not begin operations until Sept. 1949. Helicopter Air service, serving the Chicago area, began operations Aug. 20, 1949. It was the second helicopter mail service to be started, following Los Angeles Airways which began in May 1947.

The de Havilland Comet, the world’s first jet airliner, which flew for the first time on July 27 1949. On Oct. 25 it flew from London to Castel Benito, Tripoli, and back in 8 hrs. at an average speed of nearly 450 m.p.h.
The Civil Aeronautics board finally awarded five-year temporary all-cargo operating certificates in Aug. 1949 to Slick Airways, Flying Tigers and U.S. Airlines, culminating a three and a half years’ battle for recognition on the part of these “irregulars” against determined opposition from the major certificated carriers.

In spite of four serious accidents in the last half of the year, the U.S. scheduled airlines set a new safety record in 1949, operating domestically and on routes around the globe at an over-all average rate of 1.0 passenger fatality per 100 million passenger-mi. On international routes U.S. carriers had a perfect safety record, flying 2,100 million passenger-mi. during the year. On domestic routes, the safety record was the same as in 1948, namely 1.3 fatalities per 100 million passenger-mi. but the airlines flew over 1,000 million more passenger-mi. than during the year before.

There were an estimated 510,000 certificated pilots in the United States at year’s end, as against 491,306 the preceding year. Of these, 9,678 were women pilots. Some 1,800 women were rated as air traffic control operators, about one-fifth of the total in that branch. The number of new student and private pilot certificates issued showed a sharp decrease. Partly due to a revision of its records, the Civil Aeronautics administration reported a decrease in the number of civil aircraft registered: 92,700 at the end of the year. The number of airports in operation remained about 6,100.

As a result of the growing use of landing and air navigation aids installed on the Federal airways by the C.A.A., the airlines continued to increase the regularity of their scheduled operations without reducing safety standards. Instrument landing systems were in daily use at 87 points in the continental U.S. and at 2 points in Alaska. Static-free very high frequency radio ranges were installed at 370 points by the end of the year. The Collier trophy was awarded to the Radio Technical Commission for Aeronautics for its new air traffic control plan, which would not become effective, however, for several years. Under the Federal Aid Airport programme, the C.A.A. made grants totalling some $99 million for improvements at 783 different airports.

Meanwhile, the Civil Aeronautics board was wrestling with approximately 1,100 undecided proceedings which had piled up on its calendar, including new route applications, proposed mergers, interchange agreements, foreign permits, mail rate decisions and other matters affecting the economic future of the airline industry.

**South America.** In Argentina one of the most imposing airports in the world, the Pistaarini International airport located 15 mi. from Buenos Aires, was opened to traffic on Oct. 27, 1949. The four Argentine air lines, however, reported heavy losses ever since the government had taken them over a few years previously. F.A.M.A., the principal international air line which had been expected to begin operations between Buenos Aires and New York in 1949, was planning to do so during 1950.

In Brazil, Panair do Brasil maintained four round trips a week to Europe, Africa and the middle east with Constellations. Together with Cruzeiro do Sul it operated seven round trips weekly to Uruguay, Argentina and Paraguay. These two carriers and Aerovias Brasil accounted for over three-fourths of Brazil’s air line traffic.

At La Paz, Bolivia, which boasts the highest airport in the world (altitude 13,398 ft.), Braniff Airways operated DC-4’s using jet-assisted take-off (Jato) and Panagra was planning to extend similar Jato DC-4 operations into other high-altitude airports along the Andean chain, notably at Cochabamba, Bolivia, and Arequipa, Peru.

Pan American World Airways’ Latin American division reported a record year for 1949, carrying 709,000 revenue passengers a total of 586 million passenger-mi., compared with 683,600 passengers and 548 million passenger-mi. in 1948. Cargo totalled 16,650 tons in 1949, compared with 14,620 tons the preceding year. The Latin American division completed four and a half years of accident-free operation on Dec. 31, 1949, during which about 2,500 million passenger-mi. were flown without injury to passengers or crew. (See also AIRCRAFT MANUFACTURE; AIRPORTS; AIR RACES AND RECORDS; JET PROPULSION AND GAS TURBINES)

**BACTERIOLOGY.** The Society of American Bacteriologists held its 49th annual convention at Cincinnati, Ohio, in May 1949 with a full programme including 217 scientific papers. A significant step was taken by a committee of the society with a view to improving the professional status of all bacteriologists.

A typical study in the field of bacterial physiology was presented by S. J. Aji and C. H. Werkman of the Iowa Agricultural Experiment station who extended knowledge of the new concept that heterotrophic metabolism utilized CO₂ in synthesis. A related paper by S. M. Martin and P. W. Wilson of the University of Wisconsin reported the utilization of CO₂ by *Aspergillus niger*.

Among the reports on agricultural bacteriology was a study of nitrogen fixing bacteria (*Rhizobium*) from *Caugana arborescens* by K. F. Gregory and O. N. Allen of the University of Wisconsin.

A representative research in the field of industrial microbiology was reported by D. G. Reinhard and J. C. Garey of the Pennsylvania State college, who studied the development of free amino acids in cheese during the curing period. A paper on medical bacteriology was that by N. B. Williams and M. A. Judson of the University of Pennsylvania School of Dentistry, who found enterococci in apical abcesses of teeth and demonstrated S. *faecalis*, *S. liquefaciens*, and *S. zymogenes* in the normal mouth of many persons.

All the local branches of the Society of American Bacteriologists held meetings during the year and researches in all fields were described. One interesting study made at the U.S. Public Health Service, Communicable Disease centre, Atlanta, Georgia, dealt with the *in vitro* virulence test for *C. diphtheriae*. The test was made in a special culture medium and would eventually eliminate the necessity of using animals in this important laboratory procedure. At a meeting of the south western branch, held at Tuscaloosa, Alabama, a film showing a simple method for the prolonged preservation of bacteria by desiccation in vacuo was shown for the first time. The film, with sound effects and spoken narrative, was to be made available on loan from the Communicable Disease centre, U.S.P.H.S., Atlanta, Georgia. Many valuable new films and other visual aids to education in bacteriology were also made available during the year by the Society of American Bacteriologists.

A symposium on Brucellosis was held at Bethesda, Maryland, in September and papers were read on every important aspect of the subject by a panel of experts.

On Oct. 28 and 29 the New York Academy of Science sponsored a conference on the mechanism and evaluation of antisepsics. The first session was devoted to antibiotics, the second to surface-active anti-microbial agents and the third dealt with the use of miscellaneous chemicals, especially halogens, as antisepsics. The value of ethyl alcohol as a general disinfectant, long regarded as insignificant, was re-emphasized during this meeting. It appeared that 2% solutions of iodine in alcohol might be one of the most useful disinfectants for external application.
Much interest was also shown in new surface-active, synthetic disinfectant-detergents, a great many of which appeared on the market and in the trade during the year. Special interest centred around the quaternary ammonium compounds, especially in their mode of action and in inactivators for them, to be used in differentiating between their bacteriocidal action and their bacteriostatic action.

In November the American Type Culture collection published a new catalogue, the first since 1938. In the new edition 2,975 strains of organisms were listed, of which 49% were bacteria, 28% higher fungi and 16% yeast. Also included were algae, protozoa and bacteriophages. Viruses and rickettsiae were to be handled separately and listed in a separate catalogue.

(M. Fr.)

BADMINTON. The international Badminton championship was won by Malaya who defeated the United States 6–3 at Glasgow and Denmark 8–1 at Preston, Lancashire, in the inter-zone ties. Ten countries competed and England, after victories over Scotland and France, lost to Denmark in the European zone final. In other international matches England beat Scotland 7–2 and Ireland 5–4, and lost to Sweden and Malaya. Scotland also lost to Ireland and U.S.A. The All-England championships were played at Harringay arena, London, when titles were won by David Freeman (U.S.A.); Miss Aase Jacobsen (Denmark); Oo Teik Hock and Teoh Seng Khoon (Malaya); Mrs. H. S. Uber and Miss Q. M. Allen (England); and Clinton Stephens and Mrs. Stephens (U.S.A.). Cheshire won the inter-county championship, beating Surrey in the final. Thirty-three counties took part.

Some 60 open tournaments were held in various parts of Great Britain. 1,900 clubs were affiliated to the Badminton association of England and 600 to the Scottish Badminton union (H. A. E. S.)

United States. Marten Mendez of San Diego, California, captured the men’s singles honours in the 1949 national badminton championships at Chicago, Illinois, when he defeated Joseph Alston, also of San Diego, 15–8, 12–15, 15–5, while Ethel Marshall, Buffalo, New York, won the women’s laurels for the third successive season. Miss Marshall routed Marriana Gott of West Los Angeles, California, 11–2, 11–8, in the title round.

Wynn Rogers of Arcadia, California, teamed with Barney McCay of Alhambra, California, to win the men’s doubles. Thelma Scovil and Janet Wright, both of San Francisco, California, again repeated their previous success in the women’s doubles and Rogers triumphed in the mixed doubles with Mrs. Loma Smith of Arcadia. (T. V. H.)

Rapid progress was made in the construction of Butlin’s vacation village at West End, Grand Bahama. Announcements were made of negotiations with the United States for passage over the colony of rockets from Florida on the first 500 mi. leg of a Caribbean guided missile range. A general election in the summer resulted in 13 new members being elected to the House of Assembly. After further re-examination it was decided the sponge beds were not yet sufficiently restored to justify re-opening.

Finance and Trade. The local tender is British sterling currency, though U.S. currency is also generally accepted. Budget (1948): revenue £1,360,226; expenditure £1,317,621. Foreign trade (1945): imports £4,720,151; exports (visible) £351,920. Tomatoes, lumber and crawfish were the principal exports in 1948, but the economy of the colony is primarily dependent on the tourist industry. (J. A. H.)

BAHREIN ISLANDS: see ARABIA; BRITISH EMPIRE.

BAKERY PRODUCTS: see BREAD AND BAKERY PRODUCTS.

BALANCE OF PAYMENTS. Events of 1949 justified fears expressed in the previous year that Great Britain might not succeed in maintaining the improvement in her balance of payments achieved in 1948. During the second and third quarters of the year, much of the ground gained during 1948 was lost, nor could it be fully recovered in the last quarter. This setback was not immediately apparent; on the contrary, the total deficit, amounting to £10 million for the first half of the year (or £20 million at the annual rate) represented less than one-fifth of the £110 million shortfall for 1948. But this seeming improvement concealed a renewed increase in the dollar deficit, its most important and at the same time least tractable component. This adverse development was largely due to a marked decline in business activity in the U.S. and in the dollar area in general. Thus, according to estimates of the U.S. Federal Reserve board, the volume of industrial production in the U.S. had, by Oct. 1949, contracted by more than one-fifth (22%) compared with its maximum of Oct.-Nov. 1948. As a result, U.S. imports dropped appreciably and the dollar income of the exporting countries shrank correspondingly. The dollar shortage, manifest throughout the world after World War II, grew worse again, after some improvement in 1948. Most countries could only meet their commitments in that currency by further depleting such meagre gold and hard currency reserves as they could muster. In Great Britain’s case, in particular, a heavy outflow of gold and dollars reduced these reserves to far below the safety level, generally set at £500 million. Ultimately, in an attempt to stop the heavy drain, the pound was devalued (Sept. 18), a measure followed by the devaluation of many other currencies.*

---

*Great Britain’s gold and dollar holdings were as follows: Dec. 31, 1948; £457 million; June 30, 406; Sept. 30, 351 (after a loss of 330 on Sept. 18); by Dec. 31, 1949, they had improved to 416. All figures at pre-devaluation rates.

† Provisional figures for first six months.

Current Account. At first sight, the figures for the first half of 1949 (released in October) hardly reflected the onset of a new crisis. Exports in the second half of 1948, when there had actually been a surplus of £45 million, the results were the best recorded since the end of World War II. Total receipts from abroad had risen by 13-4% over the period; total outward payments had increased by only 8%. Exports...
of merchandise had expanded by 16.6%, against only 6.3% for imports. Altogether, exports had made a very satisfactory showing, although their rate of expansion had slowed down. But analysed by destinations, their dollar content had shrunk by some 26% compared with the second half of 1948.

Invisible Trade. Income from invisible transactions had, on balance, contracted by 26% over the period. (See Table II.)

Invisibles would have made a better showing but for the heavy increase in government payments abroad of which fully £112 million were military expenditure. Receipts from all commercial transactions combined improved appreciably (+17.5%). The gradual replacement of merchant tonnage lost during World War II showed in a further striking advance of shipping receipts (+42%). The expansion of earning assets more than outweighed the progressive drop in freight rates after 1948. The omnibus item “Other receipts,” containing the overseas income of British oil and insurance companies, royalties, bankers’ and merchants’ commissions, etc., less payments made under these headings, rose only by a small amount after its remarkable expansion in 1948. Not unexpectedly, income from interest, profits and dividends dropped (by about 15%). Taking the 30 months from Jan. 1, 1946, to June 30, 1949, the progressive decline of Great Britain’s “independent income” was unmistakable, reflecting further sales of foreign assets during the first postwar years, after the large-scale realizations of the war period.

On the debit side, the excess of British tourist expenditure abroad over expenditure of foreign tourists in Britain was appreciably reduced. The figures for the first half of the year did not, however, include the results of the main tourist season.

In the final outcome, the total deficit of the balance of payments on current account at the end of June 1949 represented, at £10 million, less than 1% of the balance sheet total. Had currencies been freely convertible in gold and dollars, there would thus have been no “balance of payments problem” for Britain, for it would then have been possible to offset practically the whole of payments currently owed by Britain, a negligible balance excepted, by sums currently received from her debtors. But after 1939, such compensation had in actual fact been quite impossible. The final deficit was a mere book entry, the result of a purely nominal compensation between certain positive and negative items. (See Table III.)

As the surplus of £155 million from countries outside the dollar area could not be used to settle the dollar deficit amounting to £135 million, the latter figure (not the £10 million of the total deficit) measured the real size of the gap in the balance of payments. On an annual basis, the dollar deficit was still equivalent to £270 million, against £280 million for 1948, and £230 million for the last six months of that year. Compared with last year, the best achieved after the end of World War II, it had, since the beginning of 1949, increased by over one-sixth (+17.5%).

For the first half of 1949, the net gold and dollar deficit with the dollar area, on capital account, amounted to £239 million (1948, full year, £423 million; last six months, £169 million). Compared with the second half of 1948, the rate of the deficit had thus increased by 41.4%. The adverse movement had gained in speed during the second quarter of 1949 when the outflow totalled £157 million, against £82 million for the first quarter.* Payments made for United Kingdom account, at £153 million, ran at practically the same rate as for 1948, but those made on behalf of the rest of the sterling area more than trebled (£43 million for six months, compared with £17 million for the whole of 1948).
months, against £26 million for the full year 1948). The major part of these gold and dollar losses must be ascribed to increased imports of American goods by the other sterling area countries (India, and also South Africa, despite some reduction, as compared with 1948). In part, this development might have been due to defects in the exchange control. But too rapid a release of sterling balances, for political or military reasons, seemed to have been the decisive factor. Such funds were either converted into dollars or used to pay for goods purchased in Great Britain. (Such British exports were thus settled through the capital account by a mere bookkeeping entry. Hence the expression “unrequited exports” used to designate these transactions. While these exports made an important contribution to employment in Great Britain and to the maintenance of British goodwill in the sterling area, they frequently absorbed resources which might have been used for the production of “dollar exports.”)

Against this outflow of gold and exchange reserves had to be set the reduction, resulting from this release, in the United Kingdom’s external indebtedness (£125 million) and a net increase in its external capital assets both inside and outside the sterling area (£104 million). The remaining debt balance of £10 million was equal to the deficit on current account (see above). As with the current account and for the same reasons, the gold and dollar deficit was decisive for an assessment of the real position on capital account.

Sterling Balances. At the end of 1949, the future treatment of the sterling balances promised to become a major issue. For economic and political reasons alike, the creditors—among which were such undeveloped countries as India, Pakistan, Egypt, Iraq, etc., but also a number of countries outside the sterling area—could at best be expected to accept a very partial write-off of their claims, even though these might, in many cases, have arisen out of defence expenditure undertaken by the United Kingdom on their behalf during World War II. Yet, the acceleration of their drawings (£130 million in 1947; £213 million in 1948; £125 million during the first half of 1949) placed an excessive burden on the United Kingdom’s strained resources. This problem became even more urgent with the approaching end of the European Recovery programme: indeed, E.R.P. aid had, during the first half of 1949, covered 69% of the total gold and dollar outflow (£166 million out of £239 million). A long term funding agreement limiting both the conversion of sterling balances into dollars and the volume of unrequited exports would thus be of great help.

Interim Measures. Pending the conclusion of such an agreement, and with the drop in dollar receipts from direct exports, only two means—both short-term expedients—were available to deal with the dollar deficit: a further reduction of imports from the dollar area; and a devaluation of the pound in order to stimulate exports to the dollar area. The cut in imports was decided upon in July, after the onset of the mid-year crisis, and was to have produced a saving of $400 million (then £100 million) over a full year, but as previous cuts had already reduced these imports to the barest essentials, the possibility of further savings on that score appeared in fact doubtful, nor could they in any case be effective much before the middle of 1950. Thus, only devaluation remained to stop the dollar drain at short notice. It achieved this immediate purpose and £21 million worth of gold and dollars (at the old rate of exchange) returned to the Exchange Equalization account during the last fortnight of September and the reflux continued thereafter, if at a slower pace. But the long term advantages of devaluation were more doubtful: resources of manpower and productive equipment were fully employed; British economy showed distinct signs of inflation, and devaluation was an inflationary measure; finally, the receptivity of the American market for increased imports appeared very doubtful indeed. During the last weeks of 1949, it was not yet certain whether dollar receipts could be maintained at pre-devaluation level, let alone increased. (At the beginning of Jan. 1950, the chancellor of the exchequer announced that the total balance of payments deficit for 1949 would “ not be far from that of 1948 in which there was an overall deficit of £110 million.” But the amount of the dollar deficit for 1949 was not yet known. The rate at which it was running was higher at the end than at the beginning of 1949.)

The Balance of Payments Crisis as a World Problem. In a report issued in Jan. 1949 by the Organization for European Economic Co-operation, official admission had come for the first time that despite American aid and whatever their efforts, the O.E.E.C. countries, upon termination of the European Recovery programme (June 30, 1952, at the latest), would still show a dollar deficit of about $3,000 million. At the end of 1949, it was practically certain that Great Britain, singly or in conjunction with her O.E.E.C. partners, would be unable to equilibrate her dollar balance by that date without outside help. There was growing recognition that the dollar shortage had to be considered as a long term factor in the balance of payments position, resulting from important structural changes that had taken place in world economy after 1920. To the persistent deficits of Great Britain and most other countries corresponded as persistent a surplus in the U.S. balance of payments. Both were abnormal in volume and duration. In Europe at any rate, it was no longer doubted that the U.S., to redress this situation, would have to make radical changes in its tariff policy, in order to replace by an import surplus the long standing export surplus in its own balance of payments.

Despite growing recognition of this necessity in the U.S.—as evidenced by President Truman’s and Dean Acheson’s speeches in November—the slowness of progress in this direction caused grave fears among European observers. Many also held that neither the recommended resumption of American private lending to foreign countries nor the development of backward areas—point four in President Truman’s inaugural address of Jan. 1949—would be an adequate substitute for a change in tariff policy, the factors of volume and time being decisive. At the end of 1949, Great Britain’s and western Europe’s prospects for 1952 and after appeared bleak indeed. With the approaching end of E.R.P. and failing a change in American economic policy, the balance of payments crisis might in the early 1950s cause a general economic crisis.
BANK FOR INTERNATIONAL SETTLEMENTS.

Founded in Basle, in 1930, this institution was established by the main European issue banks and commercial banks for the purpose, first, of handling the transfer of German reparations under the 1930 Hague agreement (Young Plan) and, secondly, of acting as banker to these issue banks. After 1945, its activity was mainly devoted to this second function. After 1947 it also acted as central clearing agent under multilateral monetary compensation schemes (extended in Oct. 1948 to all members of the Organization for European Economic Co-operation).

**Liabilities**

During the financial year 1948-49, customers' deposits in gold and various currencies increased to almost four times the amount of the previous year thus enabling the bank to expand correspondingly its productive lendings and investments. In 1948-49, also, the bank's turnover was two and a half times as large as in 1947-48 but the net profit, at Swiss (gold) Frs. 5,101,856 against 9,541,434, was appreciably lower. As had been the case since 1944-45, the last year for which a dividend was paid, the whole profit was placed to reserve.

The bank's cautious dividend policy was accounted for by the fact that a large proportion of its assets continued to be invested in Germany in execution of the Hague agreements of 1930. In 1949 both the legal position and the real value of these assets remained undeclined. The bank's liabilities to reparation creditors represented roughly 90% of its German assets and, to the extent of some 55%, were covered by its open reserves.

At the opening of the financial year 1949-50, Maurice Frère, governor of the National Bank of Belgium, continued as chairman of the bank with Sir Otto Niemeyer, a director of the Bank of England, as vice chairman. Roger Aubon (France) continued as general manager. The highly informative Annual Report of the bank was again published under the supervision of Dr. Per Jacobsson, economic adviser to the bank.

**Banking.** Inflationary stresses, together with the measures taken by the various governments to contain them, dominated the banking scene in Great Britain, the Commonwealth, Europe and the middle east in 1949. In most of these areas, internal financial conditions were more stable than in 1948, in large measure owing to the widespread realization that a more vigorous application of dis-inflationary proposals drawn up in earlier years was needed to combat the new difficulties that arose in the external payments field from the change in the world economic climate. The dislocation of international trade caused by the divergence of sterling and dollar prices in the period before the world currency realignment had little direct effect on banking affairs in most countries. After the currency realignment banks in many of the countries that had devauled their currencies were called upon to tighten credit restrictions. This was in connection with official programmes to combat the inflationary forces that were expected to be released by the exchange adjustment. Otherwise the alteration in currency exchange rates produced few important changes in the banking situation in these areas before the year closed.

**Great Britain.** The year opened in Great Britain with a decisive down-turn in the volume of bank money, explained partly by seasonal factors and partly by the pressures exerted by the government's money policy. The budget proposals introduced in April turned out to be less disinflationary in their effect than Sir Stafford Cripps, the chancellor of the exchequer, had intended and bank deposits showed a tendency during the summer and autumn months to climb at a pace that could not be wholly explained by seasonal considerations. The table giving the out-turn for 1949 up to October of the 11 London clearing banks (which together accounted for about 95% of all commercial banking resources in Britain) showed that at that time the total of bank deposits was virtually as high as a year before.

Examination of the banks' asset figures given in the table reveals that although total bank resources showed little net change in 1949, there were important changes in the way in which these resources were employed. In the first place, there was a considerable drop in the volume of bank lending to the public sector of the economy and an equally large expansion in lending to the private sector. The fact that cash, call money, holdings of bills and treasury deposit receipts together showed a substantial net decline during the year was due to a reduction in the volume of bank financing of the government's floating debt. The rise in bank loans reflected the provision of additional finance by the banks to industry and commerce. Further, as there was no reason to suppose that the government was a net seller of medium and longer-dated government securities during the year, the presumption was that the increase recorded in the bank's investments also indicated purchases from the general public and therefore an indirect method of extending additional finance to the private sector of the economy.

An original intention of the Cripps disinflation policy was to repay the government debt held by the banks with the aid of a budget surplus and so place these institutions in a position to furnish without increasing total lendings, the additional monetary resources needed by industry to finance reconstruction and development. This intention appeared to have been largely realized in 1949 so far as the "switch" from official to private lending by the banks was concerned. But in the event the contraction in bank lending to the government was due more to an unexpected accumulation of sterling resources in the hands of the government departments caused by the development of a substantial overall trade gap in the middle of the year than to an excess of government receipts over payments on budget account.

**Ballet:** see Dance.
The second major change in the deployment of British bank resources in 1949 was the result of the official decision to reduce the amount of government borrowing on the treasury deposit receipts in favour of increased borrowing on treasury bills. This development was welcomed, the banking community in general having long argued that the T.D.R., introduced during World War II as a means of drawing finance in the required amounts from the banking system quickly and conveniently, was not suited to peace-time conditions.

The increasing difficulties experienced by industry in raising capital on the new issue market kept the demand for bank finance on industrial account at a high level during the year. The banks continued to restrict lending in accordance with the directive given to them by the government earlier in the year. But despite the rise in rates of interest on government securities during the year, no general increase was made in rates of interest charged for bank loans. Small adjustments were made, however, in rates quoted for discounting commercial bills, consequent upon the increased risks attaching to this type of paper after the change from sellers' to buyers' market conditions in world markets.

During the year it was announced that two important Scottish banks, the Clydesdale bank and the North of Scotland bank, were to be merged from 1950. The spheres of influence of the two banks, both of which had been owned by the Midland bank for over 25 years, were complementary so that no great structural changes were involved.

The Commonwealth. One of the most interesting developments in banking affairs in the Commonwealth countries was the dismissal by the Privy Council of the United Kingdom of the appeals made by the Australian government and several state governments of Australia against an earlier ruling by the High Court of Australia that vital operative sections of the Australian government's act nationalizing the trading banks of that country were ultra vires. In the absence of a clear statement by the Australian government, however, it was impossible to say whether the threat of nationalization of the trading banks had in consequence been permanently or temporarily removed. The resources of the Australian banks continued to expand during the year, the deposits of the nine trading banks rising to £795.0 million in July as compared with £698.6 million a year before. The movement was due in part to the influx of capital from overseas and in part to inflationary pressures generated by the high level of export earnings and intense activity in the capital development field, the latter being itself to some extent the result of the inflow of overseas capital for investment purposes. Most of the additional resources were devoted by the banks to strengthening "special accounts" with the Commonwealth bank. Loans to private industry were, however, increased by about £40.0 million during the year.

In New Zealand the exchange revaluation of July 1948 helped to restrain inflation previously caused by expanding export incomes and the steady rise in the prices of imported goods. But there was a further modest addition to the volume of bank resources in the year to mid-1949.

The money-goods gap caused by the high level of capital development and the government's efforts to stimulate exports to the United States produced a further expansion in the volume of bank activity in money terms in Canada during 1949. The active note circulation of the Bank of Canada in 1949 rose up to August by 2% to $1,085 million. Over the same period, the deposits of the chartered banks showed an increase of $582 million to $8,188 million. About one-half of these additional resources were utilized to expand the banks' holdings of government securities. Most of the balance was represented by increased loans to industry and commerce.

The deterioration in South Africa's payments position in progress through the greater part of the year, and the steps taken by the government to deal with it, had sharp repercussions on the country's banking situation. At the beginning of 1949, the banks were asked, as a matter of public policy, to contract credit facilities for non-productive purposes generally and to restrict advances in the case of less essential or over-developed industries. After the devaluation of the South African pound in terms of the U.S. dollar, the government embarked on a positive policy of "dearer money." The bank rate was raised, causing the commercial banks to make corresponding adjustments in rates for deposits, loans and discounts. The drain on the cash resources of the banks caused mostly by payments on sterling account and by the deposit of commercial bank funds with the National Finance corporation, set up during the year to channel "idle funds" into desirable capital outlays, caused the authorities to adjust the minimum reserve which the South African commercial banks were required to maintain with the Reserve bank from 10 to 7% in the autumn. In the twelve months to July 1949, these reserves dropped by ESA106.6 million to ESA44.9 million. Over the same period, deposits declined from ESA395 million to ESA110.9 million.

A feature of the Indian banking year was the passing of new legislation to bring the commercial banks under closer official supervision, with the particular object of limiting the extent to which such banks could mismanage their affairs. Inflationary forces were at work during the greater part of the year, but owing to the relief provided by the inflow of unrequited imports from the United Kingdom the net expansion in the volume of bank money was relatively moderate.

In Pakistan, further important steps were taken to strengthen the banking structure in order to make it easier to carry out the government's new economic development programme. The Ceylon authorities pressed forward with plans for the establishment of a central bank. In this connection a proposal that the dominion should retain part of its net earning of dollars, instead of contributing them to the sterling area pool, for the purpose of starting a gold and dollar reserve was approved by the British authorities.

The Middle East. The new Israeli government carried out a general overhaul of banking arrangements following the decision to make the Anglo-Palestine bank the central bank of the new state which had been taken towards the close of 1948. In the neighbouring kingdom of the Jordan steps were taken to establish a state bank and to provide for the issue of a separate Jordanian currency.

Europe. The outstanding development in banking affairs in France, Italy, Belgium and Western Germany in 1949 was the partial relaxation of the credit restrictions that had been imposed in 1947 and 1948 to counter inflationary pressures. In all these countries interest rates were reduced and physical controls on lending modified with the deliberate object of encouraging increased lending by the banks to obtain capital outlays. In Belguim official steps to this end included a complete overhaul of the regulations governing the cover of liabilities maintained by the commercial banks, as well as a reduction in bank rate. In most of these countries the "cheaper money" policy led to an expansion in the advances and deposits of the trading banks. In Switzerland an important factor in the banking situation during 1949 was the renewed influx of gold from other countries. However, steps taken by the Swiss authorities to "neutralize" the gold inflow proved largely successful, the volume of bank money showing no substantial change. In the Netherlands and the Scandinavian countries, the tendency for the supply of savings to fall short of the demand for investment finance was the main concern of bankers. The demand for bank finance on official account was, however, generally much reduced when
BANKING

compared with the preceding years so that it was possible to avoid further large increases in balance-sheet totals of an inflationary character.

(C. H. G. T.)

United States. In 1949, banking and monetary developments followed a pattern first of moderate contraction of bank credit and then of renewed expansion. Contraction of bank credit occurred in the winter and spring, accompanying the downward movement in business. Later in the year, recovery in levels of economic activity brought about a resumption of bank credit expansion. A notable development in the field of banking which occurred during 1949 was a comprehensive congressional study and investigation into the effectiveness and co-ordination of monetary, credit and fiscal policies. The Subcommittee on Monetary, Credit and Fiscal Policies of the Joint Committee on the Economic Report received statements on the issues involved from the heads of government agencies in the credit field and from a number of leading economists, bankers and businessmen. The publication of this collection of statements was followed by hearings before the sub-committee during November and December, and by the submission of a report by the sub-committee in Jan. 1950. Sticking differences of opinion among government officials, bankers and economists appeared in the course of the congressional inquiry. In its report, the sub-committee recommended "not only that an appropriate, vigorous, and co-ordinated monetary, credit and fiscal policy be employed to promote the purposes of the Employment act, but also that such policies constitute the government's primary and principal method of promoting those purposes."

In 1949 total bank deposits, other than inter-bank and United States government, and currency outside banks rose by $1,000 million to reach a new record level of $170,100 million at the end of 1949. The decline in currency outside banks, of about $1,100 million marked an acceleration in the decline of the preceding two years. Demand deposits adjusted rose $1,200 million during the year. The rise in total time deposits adjusted, amounting to $1,000 million represented a corresponding increase of time deposits at mutual savings banks with an increase of $100 million in time deposits at commercial banks being offset by a decline of about the same amount in postal savings deposits.

During the year as a whole, total loans of all commercial banks increased by about $800 million. Holdings of government securities rose $4,700 million and holdings of other securities increased about $1,000 million. Total loans and investments rose by about $6,500 million during 1949. These developments were in sharp contrast to those of the previous year when a large increase in the total loans of all commercial banks was offset by a greater decline in holdings of government securities with total loans and investments showing a decline.

At the end of the year, total loans of all commercial banks amounted to $43,300 million, exceeding all previous records. During 1946, 1947, 1948 and 1949, major changes had taken place in the composition of loans and investments of all commercial banks. Total earning assets of all commercial banks showed some decline in the four years from $124,000 million on Dec. 31, 1945, to $120,800 million at the end of 1949. Total loans were up $17,200 million. In contrast, holdings of government securities declined by $23,300 million. Holdings of other securities rose to $3,000 million.

On June 30, 1949, national banks, which numbered almost 5,000, held $78,200 million of total deposits. State banks, which numbered rather more than 9,000 had total deposits of $59,300 million. Total consumer credit outstanding was $18,800 million at the end of Dec. 1949, an increase of 15% or $2,500 million during the year. Almost all of the total growth occurred in the instalment credit category, with non-instalment credit, including charge accounts, single payment loans and service credit, rising only slightly. Apparently in response to eased credit terms, which occurred after expiration of Regulation W on June 30, outstanding instalment sale credit (appliances, furniture, radio and television sets) was 21% greater than at the end of 1948. Cash instalment loans increased 14% during 1949, evidence of the gradually weakening liquid asset position on the part of individual consumers. The gold stock showed little change during the year as a whole. An increase of almost $400 million in the gold stock in the first nine months of the year was followed by a decline of almost $300 million after the devaluation of the British pound and other currencies in September. Just before the devaluation of the pound sterling on Sept. 18 and the subsequent changes in other currency values, the gold stock reached a record of about $24,700 million.

Corporate issues for new capital decreased in 1949 as compared with the preceding year, but nevertheless remained at a high level. New corporate security financing fell off sharply during the last six months of the year, however, in large part as a result of a moderate decrease in business capital expenditures and lessened working capital requirements. During the year the volume of new stock issues somewhat exceeded the 1948 total. Refunding issues were small in volume. State and local government issues for new capital reached a new record-breaking total, in spite of the reduced contributions of veterans' bonus bonds.

(J. K. L.)

Mutual Savings Banks. The mutual savings banks of the United States ended the year July 1, 1948-July 1, 1949, with assets totalling $21,112,142,047, deposits of $18,949,020,111, and a surplus of $2,062,634,259, equivalent to 10.9% of deposits. During the year which ended on July 1, 1949, the net income in assets was $849,184,942 or 4.2% and the net increase in deposits was $738,588,044 or 4.1%. These increases were less than those recorded during the previous year of $910,356,586 or 4.7%, and $793,955,422 or 4.6% respectively. There were 19,186,258 accounts on July 1, 1949, a net gain of 432,579 during the year, whereas in the previous year there was a net gain of 66,661 accounts.

The average rate of dividend paid by all mutual savings banks increased from 1.73% on July 1, 1948, to 1.90% on July 1, 1949. On Dec. 31, 1949, there were 531 banks and 198 branches in operation, a net decrease of one bank and an increase of 17 branches during 1949, two of which were the result of mergers. The annual growth of the savings banks had become relatively stabilized during the preceding three years at under $1,000 million. In the calendar year 1947 the net increase in deposits of mutual savings banks was $946,407,838; in 1948 it was $641,345,892, and for the first half of 1949 $547,742,152. In this same period the private share capital in savings and loan associations grew at the rate of $1,200 million annually, and private life insurance reserves increased $3,500 million annually. In addition the savings departments of commercial banks, the post offices (by means of postal savings), the U.S. Treasury Department (by selling savings bonds) and open-end investment trusts actively competed for the savings of the small investor. Since the portion of national income available for current savings had declined sharply since the war it had become necessary for the savings banks to extend their efforts to get new business. More branches, longer hours and higher dividend payments were adopted by many banks, and legal investment provisions of various savings bank states were changed to enable the banks to broaden their investments and so to increase earnings.
On July 1, 1949, the combined assets of all mutual savings banks consisted of the following: U.S. government securities, 55·22%; other securities, 11·21%; mortgage loans, 28·18%; cash and other assets, 5·39%. Mortgage loans amounted to $6,950 million, an increase of $16 million over the amount outstanding July 1, 1948. Since July 1, 1949, more than $146 million in loans were purchased from the Home Owners Loan corporation by savings banks in Massachusetts, New Jersey and New York in addition to loans made by the usual procedure. The combined portfolio of F.H.A. and Veterans Administration insured loans was $1,334 million, or 23·9% of all mortgage loans on Jan. 1, 1949. (See also Bank for International Settlements; Bank of England; Bank of France; Business Review; Export-Import Bank of Washington; Federal Reserve System; International Bank for Reconstruction and Development; International Monetary Fund.) (He. Br.)

**BANK OF ENGLAND.** Developments in Great Britain's external affairs were the main concern of the Bank of England during 1949. The bank normally acts as adviser to the Treasury in currency matters and also undertakes main responsibility for the operation of the country's exchange control machinery. In consequence, in the period prior to the devaluation of sterling in September it was called upon to play a large part in devising and enforcing measures to check the growth of evasion of the sterling area exchange regulations stimulated by the increased profitability of overseas black market dealings in cut-price sterling. Such measures were designed in particular to prevent legitimate sterling area dollar earnings being tapped by third countries and largely took the form of a general tightening-up of restrictions on transactions in sterling between the non-sterling countries. In the devaluation period, the bank's services were in demand in connection with the determination of the pound's new level and with preparations for the execution of the re-alignment operation. Subsequently it was required to devote its energies to an examination of the opportunities created by devaluation for adjustments in British exchange control policies to assist the flow of international trade and payments.

Movements in the note circulation were within narrower limits in 1949 than in the previous year, there being no evidence of large scale hoarding or dis-hoarding of bank notes by the public. In the first half of the year, the amount of currency in circulation showed a tendency to rise more rapidly than could be explained by seasonal factors, pressumably owing to the existence of inflationary pressures in the country. The total value of notes was raised by £50 million by temporarily increasing the fiduciary issue to £1,350 million between July and September to meet the summer holiday demand for additional currency.

**BANK OF FRANCE.** Although steps taken by the French government to contain inflationary stresses were relatively successful during 1949, the year witnessed a considerable increase in the note circulation of the Bank of France. The movement was to some extent explained by large scale dis-hoarding of gold and foreign currencies against franc notes by French nationals after the revival of confidence in the franc in the first half of the year. Efforts to induce the French public to invest such funds in government securities were largely unsuccessful. A second factor was the withdrawal in currency by the French government of the franc counterpart funds realized by the sale of Marshall aid supplies in France. Pending the periodic agreements with the Economic Co-operation administration, these resources were included in the current accounts and deposits of the bank. The government's ability to call upon counterpart funds to cover net deficits in respect of the nationalized industries, coupled with the increase in taxation and new efforts at economy, enabled it to cover its commitments without calling to any extent on the bank for financial aid during the year.

In June the bank concluded an agreement with the French Foreign Exchange Stabilization fund whereby it undertook to provide finance for foreign exchange purchases by the fund. Previously, such resources had been furnished by the Ministry of Finance. A condition of the agreement was that periodic sales of foreign exchange should be made to the bank to limit such advances.

The bank continued during the year to apply the "dear money" policy the government had adopted towards the end of 1948. But owing to the shortage of funds on the money market caused by the unwillingness of the French public to make savings available for investment, the bank was called upon to expand its discounts and advances by a considerable amount during the year.

**BAO DAI**, former 13th emperor of Annam (b. Hue, Oct. 22, 1913), succeeded to the throne at the age of 12 when his father, Emperor Khat Dinh, died on Nov. 6, 1925. Having completed his studies in France, he assumed power in Sept. 1932 under the name of Bao Dai ("he who maintains greatness"). On March 20, 1934, he married Mariette-Jeanne N'Guyen Huu Thi Lan, a Roman Catholic from Cochin-China who had been brought up in a Paris convent; by her he had five children. Up to the proclamation of Annamese independence by Japan on March 11, 1945, his position was unaffected by the world situation. On June 30, 1945, he renamed his state Vietnam which suggested an idea of re-unifying Tonking and Cochin-China with Annam. Shortly after the Japanese surrender he abdicated on Aug. 24, becoming citizen N'Guyen Vinh Thuy, adviser to Ho Chi Minh, leader of the Vietminh (Communist) party and president of a republic of Vietnam proclaimed at Hanoi on Sept. 2. In April 1946 Bao Dai was sent to Chungking as representative of the Vietnamese republic. When in Dec.
1946 fighting between Vietnamese and the French began, he took refuge in Hong Kong. He expressed readiness to negotiate with France "an honourable and lasting peace," and to break with Vietminh. Difficult negotiations began in Dec. 1947 and culminated on June 5, 1948, in the protocol of the Bay of Along, by which France recognized the independence of Vietnam, and in the agreement of March 8, 1949, which determined the conditions. On April 28 Bao Dai returned to Vietnam where he was declared an outlaw by Ho Chi Minh. On July 1 he formed a government with himself at the head. A clever diplomat, Bao Dai took advantage of his failure with the Nationalists to make further demands on France which became pledged to a formula of increasingly uncertain success. On Dec. 30 in Saigon he signed a series of conventions implementing the March agreement.

**BARBIROLL1.**

**BAPTIST CHURCH.** The Northern Baptist convention of the United States meeting in San Francisco, California, May 30 to June 3, 1949, registered 5,071 delegates. It was reported that of the $16,163,601 pledged to the World Mission crusade in 1947, 92.9% had been received. It was voted to allocate a larger amount of the budget than formerly to foreign missions. Negotiations with the Disciples of Christ concerning the merger of the two bodies were to continue. A proposal to change the name, Northern Baptist convention, to American Baptist convention was approved. A general secretariatship was created by combining the corresponding secretariats and the recording secretariats, the incumbent to serve as the recognized spokesman for the convention. Mrs. Howard G. Colwell of Loveland, Colorado, was chosen president for the year 1949-50, the third woman to hold the office. The 1950 convention was scheduled to meet in Boston, Massachusetts, May 21 to 26, 1950. Dr. G. Pitt Beers, executive secretary of the American Baptist Home Mission society of the Northern convention assured the Church World service that the denomination would provide homes for 1,200 families of displaced persons. The Southern Baptist convention met in Oklahoma City, Oklahoma, May 18 to 22, 1949, registering 9,357 messengers. Total gifts for the year 1948-49 amounted to $156,605,521. The Foreign Mission board proposed a goal of 1,750 foreign missionaries and an annual budget of $10,000,000. The 26,822 convention churches reported 312,246 baptisms, bringing the total membership to 6,491,981. The convention also operated 25 hospitals valued at $42,176,301. Its three theological seminaries, Southern, Southwestern and New Orleans, reported a total enrollment of 2,551 students. The convention formed a special organization through which individuals and churches might become sponsors for displaced persons. The 1950 convention was expected to take place May 7 to 12, in Chicago.

A new Baptist church at Nagyvarsany, Hungary, was consecrated May 9, 1949, with 1,000 Baptists present. The World Congress of Baptist Youth, numbering 1,350 delegates from 23 countries, met Aug. 3 to 9, 1949, in Stockholm.

During the first week of Sept. 1949, the Baptists of Wales celebrated the tercentennial of the founding of the first Baptist church in the principality. The Ontario and Quebec Baptist convention, Canada, celebrated its diamond jubilee, June 9 to 12, 1949. A memorial lectern to William Carey, the great Baptist missionary appointed by English Baptists to India in 1792, was dedicated in Westminster Abbey, Oct. 11, 1949. Dr. S. Pearce Carey presented the lectern which was received and dedicated by the dean of the abbey.

During 1949 plans were being consummated for a Commonwealth and Empire Baptist congress to be held in London, England, June 3 to 10, 1951. (See also CHURCH MEMBERSHIP.)

(R. E. E. H.)

**BARBADOS.** British colony consisting of the most easterly of the Caribbean islands. Area: 166 sq. mi. Pop. (1948 est.): 199,012. Governor, A. W. L. Savage.

**History.** Constitutional changes were proposed by the House of Assembly to the effect that it should have undivided authority in matters of finance, the life of the assembly should be extended from two to three years and a Parliament bill should be introduced to regulate relations between the assembly and the Legislative Council on the basis of those now existing between the British House of Commons and the House of Lords: and that if necessary the governor request the secretary of state for power to nominate sufficient additional councillors to secure the passage of the bill.

A report on local government by Sir John Maude recommended that the 300-year-old system of 11 vestries and 32 parochial boards should be abolished, and that the colony should be divided up into three areas for local government purposes: a northern district and a southern district (each with a council) and the town of Bridgetown, which should be granted municipal status with its local government entrusted to a city council.

( J. A. Hu.)

**BARBIROLLI, SIR JOHN,** British orchestra conductor (b. London, Dec. 2, 1899), was educated at the Royal Academy of Music, and made his first public appearance as a violoncellist at Queen's hall in 1911. He toured the British Isles and Europe as a member of the international string quartet, 1920-24. In 1925 he founded the Barbirolli chamber orchestra and in 1926 he joined the British National Opera company as conductor. In 1937 he succeeded Arturo Toscanini as permanent conductor and music director of the

**Sir John Barbirolli, conductor of the Hallé orchestra. He was knighted in June 1949.**
NEW YORK philharmonic symphony orchestra. He refused to give up his British nationality and, not being permitted by the American Musicians' union to continue in his post, left the United States in 1942. In the following year he became conductor of the Halle orchestra of Manchester. At that time the Halle was near dissolution because of wartime difficulties and Barbirolli succeeded in restoring it to its prewar eminence. At the end of 1948 he was asked to succeed Sir Adrian Boult as conductor of the B.B.C. symphony orchestra but declined, desiring to remain with the Halle. In return it was agreed that the Halle should be augmented to full concert strength, that the minimum wage for its musicians should be increased and that the orchestra should make one foreign tour each year. During 1949 Barbirolli conducted at the Belgian international music festival and at the Edinburgh festival, but in August was told by his doctors that he should restrict his activities for one year solely to the Halle. He was knighted in the birthday honours, June 1949.

BARKLEY, ALBEN WILLIAM, United States politician (b. Graves county, Kentucky, Nov. 24, 1887), attended Marvin college, Clinton, Kentucky, Emory college, Oxford, Georgia, and the University of Virginia law school, Charlottesville. He was elected prosecuting attorney of McCracken county, Kentucky, in 1905, and was judge of McCracken county court, 1909-13. He was elected to the House of Representatives as a Democrat in 1913, and after 14 years there was elected to the Senate. He was permanent chairman of the 1940 convention and at the 1944 convention delivered the speech nominating Franklin D. Roosevelt for a fourth term. During World War II he was Senate majority leader and, as such, shepherded numerous wartime and emergency acts through that body. In the 80th Congress (elected in Nov. 1946) he was minority leader in the Senate. At the Democratic national convention in Philadelphia, Pennsylvania, in 1948, he was nominated Democratic candidate for the vice presidency and on Nov. 2 was elected with President Harry S. Truman, taking office on Jan. 20, 1949, as the nation's first vice president since April 12, 1945. On Jan. 19, 1949, President Truman signed a bill to increase certain salaries including those of the president and the vice president (who is also president of the Senate) and thus when Barkley took office the following day he started to draw the increased salary of $30,000 a year (as against $20,000 previously). On Nov. 18, in St. Louis, Missouri, Barkley, who had been a widower from 1947, married Mrs. Carleton S. Hadley, a widow.

BARLEY: see GRAIN CROPS.

BASEBALL. On June 6, 1949, more than three years after they had been suspended for five years from professional baseball for jumping to the Mexican league, 18 former major league players were granted complete amnesty by Commissioner A. B. Chandler and invited to return to their former clubs immediately.

The top player deal of the year transferred pitcher Murry Dickson from the Cardinals to the Pirates for $125,000. In other manoeuvres, the Dodgers brought up pitcher Don Newcombe from their farm at Montreal, Quebec, on May 15, and the Negro righthander immediately became one of the aces of Manager Burt Shotton's staff. The Boston Red Sox also sought to strengthen their hill staff by trading pitcher Mickey Harris and outfielder Sam Mele to the Washington Senators for hurler Walter Masterson.

After more than two months on the side lines because of an injured heel, Joe DiMaggio made his 1949 debut at Boston, Massachusetts, on June 28. In his first game, the Yankee Clipper clouted a two-run homer to feature a 5 to 4 victory. The next day he poloed two round-trippers, one with two team mates on the basepaths, to highlight a 9 to 7 victory, and the third day he rapped a three-run homer as New York scored a 6 to 3 win.

Major League Races. In what were probably the most dramatic races in big league history, the New York Yankees and Brooklyn Dodgers captured the American and National league championships, respectively. Each pennant was decided on the closing day of the season with the Yankees defeating the Boston Red Sox, 5 to 3, to edge out Joe McCarthy's club by one game, and the Dodgers defeating the Phillies, 9 to 7, to protect their one-game margin over the St. Louis Cardinals, who beat the Chicago Cubs.

Individual Performances. Ted Williams' bid to win the triple crown—high-batting-average, runs-batted-in and home-run leadership—was thwarted on the final day of the season when George Kell, Detroit third baseman, passed up the Boston outfielder, posting a mark of .3429 to Ted's .3427. Williams won home-run honours, however, with 43, and tied for runs-batted-in with his teammate Vern Stephens at 159.

Jackie Robinson won the National league batting title with .342, out-distancing Stan Musial, who finished second, by three points, and gained the most valuable laurels in the senior circuit.

All-Star Game. The American league registered its 12th victory against only four losses in the midseason classic by defeating the senior circuit, 11 to 7, July 12.

World Series. The Yankees chalked up their 12th world championship out of 16 post-season series in which they participated, by defeating the Dodgers, four games to one. (A. B. C.)

BECH, JOSEPH, Luxembourg politician (b. Diekirch, Luxembourg, Feb. 17, 1887), after qualifying as doctor of law in 1912 at the University of Paris, practised as a lawyer at Luxembourg. Entering politics, he was elected to the Council of Europe in Strasbourg, Aug. 1949.

Joseph Bech, foreign minister of Luxembourg. This photo was taken at the Council of Europe in Strasbourg, Aug. 1949.
BEEKEEPING—BELGIAN COLONIAL EMPIRE

Chamber of Deputies in 1914 as a member of the Christian Social party, was minister of justice 1921-25 and prime minister and minister of foreign affairs, 1926-37. He served as foreign minister in the successive cabinets of Pierre Dupong (q.v.). From Aug. 1940 to April 1945 he represented his government in London. On Oct. 3, 1918, he married Georgette Delahaye, and had a son and daughter. On April 4, 1949, at Washington, he signed the North Atlantic treaty on behalf of the grand duchy of Luxembourg.

**BECHUANALAND:** see **BRITISH SOUTH AFRICAN PROTECTORATES.**

**BEEKEEPING.** Beekeepers in Great Britain found the year 1949 a great improvement on 1948. In districts which had sufficient rain excellent yields of surplus honey resulted. In a few places quantity of produce was disappointing; in others the hot, dry weather resulted in a mixture of honey dew, sometimes spoiling the whole take. Reports from heather districts showed that both the quantity and quality of the yield were good, owing not so much to heavy secretion of nectar as to the almost unprecedented weather conditions for foraging. Light coloured varieties were scarce, as evidenced by the exhibits on the show benches, but the darker honeys generally displayed made up for this in density and flavour. In most areas there was satisfactory storing in brood chambers, and, with comparatively little feeding, apiarists packed down for the winter with confidence.

Probably because of the exceptional heat and dryness the temper of bees was a matter for common complaint, but where adequate water supplies were available the bees were quite normal in this respect. As an offset, however, swarms were much fewer than in 1948, owing no doubt to fewer breaks in the possibilities of foraging.

Rearing young queens to head colonies in 1950 presented less difficulty than usual. Climatic conditions from early spring to the end of September were ideal for mating flights. In spite of this an exceptional number of strong colonies run for honey were queenless when supers were removed, which suggested that bees were too busy collecting nectar to attend adequately to what should have been a matter of high priority.

Bee diseases were still a menace owing to the carelessness of many owners. Acarine disease, for example, could be prevented either by using the Frow remedy in early spring or by giving a supply of wintergreen oil on packing down for winter; a small bottle of this oil stuffed with a cotton wick and placed on the floor-board between the frame ends and near the cluster was found to be an almost certain preventative. Foul brood (American and European) was not being treated as drastically as it should be; still the only known method of stamping out the disease was by burning and disinfecting. (See also *ENTOMOLOGY.*)  (W. H. R.)

**BEER:** see **BREWING AND BEER.**

**BELGIAN COLONIAL EMPIRE.** The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territories of Ruanda and Urundi. The accompanying table gives material relative to all territories administered by Belgium. Total area: about 925,094 sq. mi. Total population (1949 est.): about 14,352,200. Chief towns (white population only, Dec. 1948 est.): Léopoldville (cap., 7,244); Elisabethville (6,240); Stanleyville (1,517); Costermanville (1,511).  

**History.** The prosperity enjoyed by Belgium's African colony after World War II in 1949 showed no signs of diminishing; the year was one of consolidation, though there was, to begin with, a fall in the prices of oil-bearing products and fibres, and later of mining products. "We are doubly affected by this situation," commented the governor general, Eugène Jungers, in a statement to the council of government held at Léopoldville July 18-25. "While we are getting less for our exports, we continue to pay inflated prices for imported producer and consumer goods."

With a view to adapting the economy of the Belgian Congo to peacetime conditions and to consolidating results already achieved, a team of experts at Léopoldville under the chairmanship of the governor general, and another in Brussels under the chairmanship of Pierre Wigny, the minister for colonies, drew up a ten-year plan for economic and social development, allocating Fr.25,000 million to public investment. Published in June, the plan amply justified itself on various administrative, economic, social and political grounds, the most important being the need to co-ordinate efforts and to apportion in a co-ordinated programme the different projects to be undertaken. In the opinion of the minister for colonies, the ten-year plan was not of a restrictive nature. Each year the government would ask parliament to vote the necessary credits for the next twelve months and this, the minister pointed out, would afford the opportunity for checking the working of the plan and making any adjustments which might be required.

Not only would the ten-year plan tend to improve the living standards of the Belgian Congo's ten million population, whose essential needs were not yet satisfied, but it would also create a domestic market hitherto lacking. To this end, the government was to pursue a policy of wage increases for Natives which could be secured by developing output, conservation of crops and improving distribution and transport.

In the mining sector, since alluvial deposits were almost exhausted, new techniques were perfected for exploiting deep seams. In the agricultural domain, greater mechanization, curing processes and the construction of silos were foreshadowed.

In all, the public authorities were to devote, for the welfare of the Native population, Fr.1,500 million for the agricultural programme, Fr.2,000 million for drinking water, Fr. 2,000 million for education and Fr.2,000 million for technical instruction.

Also envisaged in the ten-year plan was intensive development of public works, including improvement of the road, railway and airway systems, of navigable waterways and of telecommunications, modernization of sea and river ports, and the construction of wharves, hydro-electrical works, refrigerating plants, scientific laboratories, etc.

Operation of the agricultural provisions of the ten-year plan began on July 15, 1949, with the passing of an order for organizing Native co-operatives. "If this programme succeeds," wrote Pierre Wigny, in his introduction to the *Plan décennal pour le développement économique et social du Congo Belge*, "we may be satisfied that for millions of human beings life will be a little easier and a little happier."

Ruanda and Urundi. The putting under trusteeship of the two territories, which since 1925 had been administered by Belgium, was approved by the Belgian parliament by the act of April 25, 1949. On April 11 the Mwamis (Native rulers) of both Ruanda and Urundi had been appointed, by decree of the regent, *ex officio* members of the vice-governor general's council.

In order to encourage greater participation by the Natives in the government of their country, the administrative authorities examined the question of creating an elected council which would have a legislative function.

With regard to the wage problem which had been raised at the fourth session of the United Nations general assembly, it may be recorded that in Ruanda-Urundi between 1938
Belgium and Ruanda-Urundi.

and 1949 wages had risen in the proportion of one to four, much more than the increase in output.

Steps were taken towards the opening of Kisantu (Belgian Congo) in 1953 of a university accessible to the inhabitants of the protected territories; moreover, from 1955 university training was to be made available at Astrida, in the heart of Ruanda-Urundi.

Education. (1948) State schools: elementary, pupils 3,464; technical, pupils 355; secondary i, pupils 311. Subsidized schools: elementary 8,001, pupils 406,652; technical 36, pupils 1,328; teachers training schools 39, pupils 2,471; secondary 12, pupils 959. "Free" (Catholic) schools: elementary 19,072, pupils 513,049; secondary 58, pupils 1,928.

(G.-H. D.)

Belgium. A kingdom in western Europe bounded by France on the S.W., the Netherlands on the N. and Germany and Luxembourg on the E. Area: 11,782.5 sq. mi.* Pop. (Dec. 31, 1948, est.): 8,602,611. Languages (1930): Dutch 42.92%, French 37.56%, German 8.55%, Dutch and French 12.92%, German and French 0.83%. Religion: mainly Roman Catholic; Jewish 34,500. Chief town (pop., Dec. 31, 1948, est.) first figure including suburbs, second figure commune only: Brussels (cap., 1,296,687; 185,112); Antwerp (chief port, 794,280; 266,636); Liége (573,176; 156,664); Charleroi (445,229; 26,262); Ghent (442,792; 166,797); Namur (215,069; 31,637); Bruges (200,830; 52,984). Ruler, King Leopold III (q.v.), Prince Charles (q.v.), regent; prime ministers in 1949, Paul-Henri Spaak (q.v.) and, from Aug. 11, Gaston Eyskens (q.v.).

History. Increasing unemployment—which already at the end of 1948 was giving cause for anxiety—was the chief political and economic preoccupation at the beginning of 1949. On March 12 the number of unemployed totalled 261,000, against 122,000 in Sept. 1948. Production, however, continued at a high level and on the stock exchange prices showed no tendency to fall. Some proportion of the unemployment, therefore, apparently was attributable to a general regrouping of manpower necessitated by a return to normal industrial activity dominated by competition. Though they agreed on measures for dealing with the problem, the two parties on the political scene—the Social Christian party and the Belgian Labour (Socialist) party—were unable to agree over the question of unemployment insurance payments.

*Including some small German frontier areas north of Aachen annexed on April 15, 1949. The six-power agreement of March 25, 1949, authorized Belgium to take over an area of about 104 sq. mi. with a population of about 6,000 but it renounced its claim to three townships and incorporated only an area of 71 sq. mi. with a population of barely 300.

The Socialists insisted on new taxes; the finance minister, Gaston Eyskens (Social Christian), opposed this, considering that a policy of economy was the only possible course. The conflict remained latent for several weeks.

The Royal Question. Meanwhile, in mid-April, a private visit to Belgium by Princess Josephine-Charlotte brought again to the fore another cause of contention between the two groups, namely, the royal question. No official reception had been arranged; but wherever she went the daughter of Leopold III was greeted by the public with enthusiasm.

On April 25 the king and the regent met at Berne, Switzerland, in the presence of Paul-Henri Spaak, the premier, and Henry Moreau de Melen, minister of justice, to discuss the political situation and the royal question. On May 3 Leopold sent his brother a letter insisting on the need to find a way out of the impasse, by a popular vote or some other constitutional means. "The country," he wrote, "must return to constitutionalism; the present abnormal situation cannot continue indefinitely." This was also the view of the Social Christian party. Since the party was still unable to persuade the Socialists to relinquish the idea of new taxation to pay for unemployment insurance, a crisis was inevitable; and on May 18 the regent signed a decree dissolveing the parliament. In uneventful conditions parliamentary and provincial elections took place on June 26, when for the first time women went to the polls. In the Chamber
of Deputies the Social Christian party out of 212 seats gained 105, the Liberals 29, the Socialists 66 and the Communist party 12. In the Senate the Social Christians secured an absolute majority with 92 seats. (See also ELECTIONS.)

On June 28 Spaak presented the resignation of his cabinet to the regent. First to be charged with the task of forming a new cabinet was Paul van Zeeland (Social Christian), who suggested a vote by the two houses in joint session to end the regency, in accordance with the act of July 19, 1945; but neither the Socialists nor the Liberals were prepared to support him in this. On July 6 the regent next entrusted Frans van Cauwelwaert (Social Christian), speaker of the Chamber of Deputies, with a mission of inquiry. Though this lasted a fortnight, it produced no concrete result. Finally, on July 23, the regent called on Gaston Eyskens (Social Christian), finance minister in the outgoing cabinet.

As the crisis threatened to continue, King Leopold on July 31 and Aug. 1 received a delegation from the Socialist party and on Aug. 2 and 3 from the Liberal and Social Christian parties. At the close of these conversations the king sent a message affirming his determination to comply with the will of the nation. "It is my express purpose," he declared, "to interpret the result of a possible referendum only in terms of the higher interests of the country. If I were led to believe that in re-assuming my constitutional prerogatives I could not serve my country, I would abdicate in favour of my son, the crown prince."

The political atmosphere having been thus clarified, the Liberal party agreed to take part in the government. Formed on Aug. 10, with nine Social Christians and eight Liberals, the Eyskens cabinet on Aug. 17 received a vote of confidence in the Chamber of Deputies by 125 votes to 64 with one abstention, and in the Senate on Aug. 18 by 99 votes to 51 with one abstention. On Oct. 27, by 100 votes to 65, the Senate approved a bill introduced by Paul Stuyve (Social Christian) for a national referendum on King Leopold's return. In the Chamber of Deputies the bill was approved on Dec. 13 by a special committee. The vote was 12 to 8, with 11 Social Christians and one Liberal in favour and six Socialists and two Liberals against.

Economic Situation. Far from worsening, the economic position of Belgium was strengthened during the first nine months of 1949. This was evident from a rise of about 10% in stock exchange quotations and especially from the balance of foreign trade. Imports for the first seven months amounted to Fr.46,900 million and exports to Fr.49,000 million, that is, there was a balance of Fr.2,100 million. Industrial production, however, was affected by the unfavourable economic conditions in Europe, as shown by the index of industrial production (1936-38 = 100): from 123 in Jan. 1949 it rose to 132 in March but it fell to 105 in July. The coal-mining and metallurgical industries were those chiefly affected.

Tax revenues conformed with the estimates. Returns for the first seven months of the year were Fr.28,400 million against an estimate of Fr.28,500 million. Compensation for this slight discrepancy was afforded by special taxes which exceeded the estimates, producing Fr.2,700 million against an estimated Fr.2,400 million.

The Belgian franc was monetarily sound when the devaluation of the pound sterling occurred, followed by the devaluation of other western currencies. However, the Belgian government was obliged on Sept. 21 to bring it into line and raise the official exchange rate from Fr.43.83 to Fr.50 to the dollar, but lower it from Fr.176.63 to Fr.140 to the pound. An early effect of devaluation was a decline in exports, these being in October only Fr.5,920 million, or Fr.300 million less than in September and Fr.240 million below the monthly average for 1948.

Foreign Policy. The replacement of Paul-Henri Spaak by Paul van Zeeland in no way modified the broad lines of Belgian foreign policy which continued within the framework of the North Atlantic treaty and the Organization for European Economic Co-operation. Some check, however, to the realization of Benelux was given by the new minister of foreign affairs. At the conference of the three interested powers held at Luxembourg in October, van Zeeland refused to ratify several paragraphs which had been initialed at The Hague by delegates appointed by Spaak and which were concerned with the unlimited acceptance of Dutch florins by Belgium and the country's withdrawal of the gold clause. The negotiations ended, however, with the signature on Oct. 15 of a protocol which, although not achieving the union contemplated, nevertheless extended the list of articles freed from licence and granted additional credits to Holland. Van Zeeland was consequently able to testify that one step forward had been accomplished. "Being realists," he added, "we took into account recent events, especially the devaluations which, of course, must have some effect. Benelux will serve the interests of the three countries: for others it has a symbolic significance."

Education. (1947-48) Elementary: infant schools 4,175, pupils 249,023; primary schools 8,697, pupils 788,514; adult schools 211. Teachers' colleges: elementary 120, students 9,443; secondary 39, students 1,055. Secondary education: state; lower grade (Bevordering) 121, pupils 52,153; higher grade (ecoles moyennes) 129, pupils 36,545; "free" (Catholic, 1945-46) 440, pupils 65,918. Technical schools (1947), pupils 226,290. Universities (1947-48) 4, institutions of higher education, students 17,933.

Agriculture and Fisheries. Main crops (in '000 metric tons, 1948; 1949 in brackets): wheat 344 (425); barley 172; oats 385; rye 184; potatoes 2,133 (1,905). Production ('000 metric tons): sugar (raw value) 263; meat 220-8; milk 2,250; butter (1947) 25. Livestock (mid-1948): cattle 1,876,876; sheep 155,173; pigs 1,074,228; horses 267,373; poultry 8,609,135. Fisheries: total catch (1948): weight 64,440 metric tons; value Fr.462 million.

BENEDIKTSSON, BJARNI, Icelandic statesman (b. Reykjavik, April 30, 1908). In 1930 he took his degree in law at the University of Reykjavik and later studied at the universities of Berlin and Copenhagen. During 1932-40 he was professor of constitutional law at the University of Reykjavik. He had joined the Independence (Conservative) party and from 1936 was a member of its executive committee. A councillor of Reykjavik from 1934, he was elected major in 1940 and twice again afterwards. In 1942 he was elected a member of the Icelandic Althing (parliament) and was re-elected in 1946, becoming chairman of the foreign relations committee of the Althing. On Feb. 4, 1947, he was appointed minister of foreign affairs in the coalition cabinet of Stefan J. Stefánsson, a Social Democrat. On April 4, 1949, at Washington, he signed the North Atlantic treaty on behalf of Iceland. He said on this occasion: "We would all prefer to lose our lives rather than our freedom, either as individuals or nations." On Dec. 18, 1943, he married Sigridur Bjornsdottir and they have two children.

BENELUX: see BELGIUM; NETHERLANDS; LUXEMBOURG.

BEN-GURION, DAVID, Israeli statesman (b. Plonsk, Poland, Oct. 16, 1886), became prime minister and minister of defence when the State of Israel was proclaimed on May 14, 1948. (For his early career see Britannica Book of the Year 1949).

After the adoption of the constitution and the formal election of Dr. Chaim Weizmann as president of the republic on Feb. 16, 1949, Ben-Gurion submitted the cabinet's resignation to the president, who charged him with the task of forming a new administration. On March 8 he announced the formation of a coalition cabinet and on March 10 received in the Israeli parliament a vote of confidence by 73 votes to 45. In his policy statement he declared that Israel would seek friendship with all peace-loving nations, particularly the U.S. and the U.S.S.R. In a speech on Oct. 29 he accused the Communists of causing labour unrest in Israel and of organizing anti-Zionist activities abroad. A struggle, he said, was being waged between the Socialist Zionists and the Communist Jews: there could be no compromise. Israel must be built as a Jewish state or act as a foreign agency.

BEQUESTS: see DONATIONS AND BEQUESTS.

BERIA, LAVRENTYI PAVLOVICH, Soviet politician of Georgian extraction (b. near Sukhum, Georgia, March 29, 1899). In 1919 he graduated from Baku Higher Technical college and from 1917 was a member of the Communist party. In 1921 he was appointed head of the Caucasian section of the Cheka (Extraordinary Commission for Repression of the Counter-revolution) and remained in this post for ten years, although in 1922 the Cheka was transformed into O.G.P.U. (United State Political department). In 1931 he became secretary general of the Georgian Communist party and in the following year secretary general of the Transcaucasian regional party commission; in this new post he continued his former function of purging the Georgian, Armenian and Azerbaijani parties of nationalist deviation. In 1934 the 17th congress of the All-Union Communist party elected him to the central committee. On Dec. 8, 1938, he was appointed head of the N.K.V.D. (People's Commissariat of Internal Affairs), into which the O.G.P.U. had been transformed in 1934. On Jan. 31, 1941, when the commissariat was divided into two sections, the N.K.V.D. dealing with internal affairs and the N.K.G.B. with state security, Beria headed the former, remaining chief of the political police. From March 23, 1939, he was substitute member of the Politburo. On June 30, 1941, he became a member of the State Defence committee. For organizing munitions production during World War II he was awarded in 1944 the title of Hero of Socialist Labour and the Order of Lenn. In 1945 he received the rank of marshal of the Soviet Union. He ceased to be the formal head of internal security on March 15, 1946, but was appointed deputy chairman of the council of ministers and, four days later, was promoted full member of the Politburo. On his 50th birthday he received the Order of Lenin for the second time. In September it became known that for four years he had been in charge of the Soviet atomic research organization.

BERLIN, Capital of the German Reich from 1871 to 1945, Berlin was still by 1949 the largest city of Germany. Area: 343-6 sq. mi. Pop.: (May 17, 1939, census) 4,332,542, (Oct. 29, 1946, census) 3,179,200 or 24 4% less. From June 6, 1945, to June 24, 1948, Berlin was administered by an inter-Alled governing authority (in Russian, Kommandatura) consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the Soviet commandant proclaimed the dissolution of the Kommandatura, Berlin was in fact divided into two opposing administrations. The three western sectors (pop., mid-1949 est., c. 2,500,000) were under the authority of the following Allied commandants: Great Britain, Major General Geoffrey K. Bourns (who on Jan. 22, 1949, succeeded Major General E. O. Herbert); United States, Major General Maxwell D. Taylor (who on Aug. 6 succeeded Colonel Frank L. Howley): France, General Jean Ganeval. In the Soviet sector (pop., mid-1949 est., 900,000) the commandant was Major General Alexander G. Kotikov. There were also two rival German city governments and two lord mayors: Professor Ernst Reuter, appointed on Dec. 7, 1948, Oberburgermeister by a city assembly elected by the population of the three western sectors; Fritz Ebert, appointed on Nov. 30, 1948, provisional Oberburgermeister of the Soviet sector by a meeting summoned by the S.E.D. (Communist) party.

History. After talks between the Soviet and U.S. representatives on the Security council of U.N. the Soviet government agreed on May 4 to re-open land traffic between the western zones and Berlin on condition that a four-power
conference was held to discuss the problems of Germany and Austria as a whole. Thus the Soviet blockade aimed at wressting the western sectors of Berlin from the control of the three western powers was abandoned after being maintained for 10 1/2 months. During the whole period the 2.5 million inhabitants of the western sectors had been supplied by the Anglo-American "air lift" which had flown 1,583,686 tons of supplies into Berlin by May 12, the date when the land blockade officially came to an end; 1,214,339 tons had been flown in by U.S. aircraft and 369,347 tons by British aircraft during this operation which was described by the British air minister as "the most outstanding transport operation in the history of aviation." The air lift did not cease immediately the blockade was lifted, but was allowed to run down gradually over a period of 4 1/2 months. By the time it ceased altogether, on Sept. 30, 2,323,738 tons of food, coal, machinery and other commodities had been flown into Berlin over a period of 15 months. The record day of the air lift was April 16, 1949, when 12,342 tons were flown into the city in 1,344 flights. The cost of the operation up to May 12 was $170 million. (See also AIR FORCES OF THE WORLD.)

With the lifting of the blockade living conditions in western Berlin became once more relatively normal. The shops filled immediately with commodities of all sorts which flowed in chiefly from the Western zones. Rationing of textiles and many other goods was abolished. Prices of vegetables dropped by as much as half. The supply of gas and electricity from the Soviet sector was resumed. And yet it soon became evident that western Berlin was faced—despite the lifting of the blockade—with a major economic crisis: a crisis of her producing industries.

This crisis had been latent in the condition of western Berlin since 1945 and aggravated by the currency reform and the blockade. West Berlin's industries suffered from a chronic lack of capital and of markets. The wholesale Soviet dismantling in 1945 had left the factories with a high proportion of damaged or out-of-date plant; the confiscation of Rm. 5,000 million in the Berlin banks had practically deprived the industries of capital; stocks of raw materials were almost used up during the blockade in the effort to keep the factories producing; and the lower value of the eastern mark, after the currency reform in 1948, gave Soviet sector and Soviet zone industries a big competitive advantage. In addition the precarious conditions in Berlin, even after the lifting of the blockade, made west German buyers reluctant to enter into contracts with west Berlin firms.

The result of this industrial crisis was twofold: the administration of west Berlin, the Magistrat, was faced with virtual bankruptcy in the shape of a budget deficit of Dm. 80 million monthly. Unemployment rose from 40,000 at the beginning of the blockade (June 1948) to 100,000 in Oct. 1948 and 250,000 in Oct. 1949.

The Western Allies and western Germany had sent much help to sustain western Berlin during and after the blockade, amounting by Oct. 1949 to Dm. 680 million from G.A.R.I.O.A. (Government Appropriation and Releases in Aid of Occupied Areas) and Dm. 530 million from the west German states. Nevertheless it was clear that a catastrophic situation would soon arise unless a great effort was made by the West German republic to put western Berlin industrially on its feet again. Leading West German politicians advocated the incorporation of west Berlin in the West German Federal republic as twelfth state; but this proposal already embodied in article 23 of the West German constitution had been vetoed by the western allied powers because it would have entailed widening the breach with the Soviet Union.

On Oct. 21, 1949, Fritz Schäffer, the minister of finance of the newly formed West German republic, announced a programme of help for western Berlin: substantial credits and government contracts were promised including the payment of the budget deficit until the end of the financial year; private firms in the western zones, likely to place orders in Berlin, were to be encouraged by federal government guarantees; goods manufactured in Berlin and sold to western zones buyers were to be exempted from indire taxe; the supposedly lost banking accounts, the so-called walt Konten, were to be revalued at 5%; a common west Berlin and western zones banking system was to be introduced; and Berlin was to be an equal, if not favoured, partner with Western Germany in receiving Marshall aid. Details in implementation of these proposals were to be worked out in Frankfurt and Bonn.

The so-called modus vivendi between east and west in Berlin, which had been agreed upon by the Council of Foreign
BERMUDA—BERMAN

Ministers (q.v.) in Paris in May and June, was complicated by a strike of the western sector railwaymen who wanted to receive their wages in eastmarks (May 20). The Berlin railways were administered by the eastern sector authorities who paid the railwaymen in eastmarks which had only about one-sixth of the value of the western currency. The strike developed into a struggle between the Independent Trade Unions (U.G.O.) of the western sectors and the Communist-dominated Free German Trade Union federation (F.D.G.B.), in the course of which shooting and casualties occurred. After intervention by the three western commandants the strike was brought to an end on the understanding that the east sector railway authorities would pay 60% of the west sector railwaymen's wages in eastmarks and the west Berlin Magistrat would exchange the remaining 40% into eastmarks (June 26).

During 1949 the Soviet sector of Berlin remained under the administration of the Communist controlled east sector Magistrat. Its industries were geared up to the Soviet zone and enjoyed also a certain market in west Berlin at the expense of western sector industries. When the so-called German democratic republic was set up on Oct. 12 no attempt was made to incorporate it into the eastern sector of Berlin which—like the western sectors—remained outside the newly formed republics.

D. A. S.

BERMAN, JAKÔB, Polish politician (b. Warsaw, Dec. 24, 1901), of middle class family, studied law at the University of Warsaw, taking active part in leftist students' clubs, while working as night editor in the Warsaw offices of the Jewish Telegraphic agency. In his early thirties he studied in Moscow at a special training school for Communist organizers abroad. A member of the executive committee of the outlawed K.P.P. (Komunistyczna Partia Polski, or Communist Party of Poland), he was arrested in 1937 at Nowy Sącz and sentenced in Warsaw to imprisonment for conspiracy against the state. In the meantime, in April 1938, the Comintern had dissolved the K.P.P. under the pretext that it was ridden with agents of the Polish military intelligence and Trotskyist "deviationists." Released from prison at the outbreak of World War II, Berman went to Moscow where he emerged as one of the organizers of the Union of Polish Patriots. He was also instrumental in creating in occupied Poland a new Communist (Workers') party. In the provisional government established at Lublin in July 1944 he was acting minister for foreign affairs. In the government of "national unity" formed in Warsaw on June 28, 1945, he became under secretary of state in the prime minister's office. He was also a member of the Politburo of the Communist party called after Dec. 1948 the P.Z.P.R. (Polska Zjednoczona Partia Robotnicza, or Polish United Workers' party).

The Defence (Local Forces) act, which introduced peacetime conscription for the first time in the colony's history, was passed by both houses of the legislature. Currency smuggling and a possible dollar "black market" aroused concern. Plans for an agricultural production and marketing scheme were introduced and approved. The return of the

Lieutenant General Sir Alexander Hood inspecting the guard of honour at Hamilton, Bermuda, on Oct. 24, 1949, when he took over as governor and commander in chief of the colony. In the background is the "Queen of Bermuda."
BETTING AND GAMBLING

BETTING AND GAMBLING. On Feb. 10, 1949, the prime minister announced the appointment of a Royal Commission on Betting, Lotteries and Gaming, under the chairmanship of H. U. Willink, K.C., and the first public meeting was held in July.

Much of the groundwork had already been covered by the previous royal commission under Mr. Justice Rowlatt in 1933, but gambling is not static: it is constantly changing with social and economic trends. The growth of commercialized gambling, particularly on football pools, since 1933 and the desire of chancellors of the exchequer to tap such a lucrative source of revenue had given a new interest to the problem of gambling. The commission had been given wide terms of reference: they would probably be content to discover how widespread gambling was, whether it was harming the welfare of the nation and how the chancellor might benefit from more comprehensive taxation. During the year evidence was given by the Home Office, the Ministry of Labour, the Post Office, the Board of Trade, the Board of Customs and Excise, the Jockey club, Tattersalls, the Racecourse Betting control board, Tote Investors, the Greyhound Racing association, the metropolitan commissioner of police, the Racecourse association, the chief metropolitan magistrate and the British Council of Churches. More evidence would be heard during 1950.

The outstanding fact was that so little statistical information about gambling could be obtained or verified. No one could state with any degree of accuracy the number of bookmakers, what number of people they employed or how large was their turnover in money. The owners of the totalizators on racecourses and dog tracks were obliged by law to disclose their turnover, and it was possible to assess the amount spent on football pools. But nothing was known of the business carried on by the bookmakers. They operated in competition with the pools and the totalizators, off the course and on the course, legally and illegally, and they were not obliged to publish accounts. The figures for the three main spheres of betting were:

<table>
<thead>
<tr>
<th>Year</th>
<th>Totalizator at races</th>
<th>Totalizator at dog tracks</th>
<th>Football pools</th>
</tr>
</thead>
<tbody>
<tr>
<td>1948</td>
<td>£26</td>
<td>£99.5</td>
<td>£61.00</td>
</tr>
<tr>
<td>1949</td>
<td>£25.8</td>
<td>£94.0*</td>
<td>£64.0*</td>
</tr>
</tbody>
</table>

Football pools showed an increase despite the drop in pool firms from 135 to 120, and the totalizator on racecourses showed a decrease despite the increased number of days of racing from 645 to 685. The totalizator on the dog tracks, though showing a slight decrease over the year, was comparatively stable after the marked drop of some £36 million on the 1947 figures. The taxation imposed in the autumn budget of 1947 was the basic cause and diverted much of the money to the bookmakers. In addition the number of totalizators working on dog tracks had now dropped from 138 to 126. In Aug. 1948 a graduated tax on bookmakers operating at dog tracks came into operation. In the two-thirds of the year (Aug. 1948-March 1949) a total of £1·7 million was received from 138,000 bookmakers’ licences. Their total turnover would not be less than £100 million for the year.

An accurate figure of the amount passing through the hands of the bookmakers was not, of course, known. In addition to the amount estimated as their turnover on the dog tracks there was the estimated turnover from horse-racing and other forms of betting. A voluntary organization called Everyman’s Leisure had been investigating this question for two years and they estimated a total of £300 million as the turnover of the bookmakers. It is important to remember that a large part of this turnover does go back to the public. What proportion stays with the bookmakers is impossible to say. A figure of between 15% and 20% is usually deducted to cover expenses and to give a reasonable profit. The actual cost of the betting industry to the public is between £95-100 million a year.

In terms of labour the evidence given before the royal commission was of interest. The Ministry of Labour stated that 40,310 men and women were employed in the betting industry and were insured under the national health service. To this figure had to be added 5,000 employers and persons working on their own account. The football pools accounted for over 23,000. These figures did not include the large number of part time employees. Neither did they include persons employed in racing stables, training, transport to and from racecourses and dog tracks and breeding. Everyman’s Leisure estimated that the total labour force, directly and indirectly connected with the betting industry, was not less than 180,000 men and women.

UNITED STATES. Gambling in 1949 was marked by fads and crazes. Ten-cent chain letters, one-dollar “ pyramid clubs,” $100,000 puzzle contests, $1,000 merchandise lotteries—all caused brief sensations. The post office declared the chain-letter scheme illegal, and the pyramid clubs were an effort to circumvent government disapproval by using the telephone instead. Each participant paid $1 and was promised an income of $2,048 when he reached the head of the list. Collections were made at a party to be given by the person at the head of the list. The craze spread throughout the country. State gambling laws were invoked without success, but the pyramid clubs soon collapsed under their own weight. There were not enough people to go round; if only one pyramid club had remained intact, at the end of 24 days it would have had to involve 268 million persons.

The merchandise lotteries were an effort to promote sales through puzzle contests based on those legitimately conducted, and approved by the post office, to secure contributions for charitable organizations. Prizes up to $25,000 were offered. The postal authorities stopped most of the disreputable “contest” lotteries through fraud actions that led to consent decrees.

Among card games the principal craze was the game canasta; but though it was by far the most popular new game of the year it was not widely used for gambling. Gin rummy remained the game played for the biggest stakes.

Betting on race-horses fell more than 10% from the 1948 levels, so far as betting on the course was concerned. The 20 states permitting totalizator betting recorded a turnover of $1,395,731,778, the sixth year in succession that the figure had exceeded $1,000 million. An expert estimate made toward the end of the year set the total amount bet on running races at $8,000 million, the majority of which was bet by 2 million regular gamblers, though there were six times as many occasional gamblers. The drop in totalizator action might have been due to the fact that there were only 2,167 racing days in 1949 as against 2,457 in 1948. Totalizator betting on harness racing increased to $205,216,832 in 1949 from $194,166,569 in 1948; this was legal in 12 states.

Despite the efforts of the Thoroughbred Racing Protective bureau (T.R.P.B.), there was proof of interference at race courses. The practice of running “ringers” (fast horses entered under the names of relatively slow ones) was thought to have been eliminated by the practice of tattooing each
horse, but a series of articles by M. MacDougall, a professional gambling investigator, exposed the continuance of such cases and the T.R.P.B. prosecuted and obtained confessions in three such cases; insiders, however, had already made a fortune by betting on the substituted horses. Milt Sosin, a reporter for the Miami News, Florida, secured photographic evidence that a spectator at the Gulfstream track was signalling race results to confederates who then bet with bookmakers who had not yet received the results by telegraph; the spectator was not prosecuted but was merely barred from the track.

The numbers racket, a form of lottery prevalent in large cities, flourished despite periodic clean-ups (as in Chicago in April and in New York in July), and despite widespread publicity that it was not honestly conducted. Slot machine gambling decreased. An investigation by a commission for Governor Earl Warren of California estimated a gross slot machine "take" of $4,000 million throughout the United States but other observers considered the figure high and thought that the actual loss of Americans to slot machines might run from one-tenth to one-quarter of that amount. (A. H. Mo.; M. Ml.)

BEVIN, ERNEST, British statesman (b. Winsford, Somerset, March 9, 1881), became secretary of state for foreign affairs in the Labour government in July 1945, and in that capacity attended every important international conference after World War II. (See also Britannica Book of the Year, 1949).

During 1949 Ernest Bevin travelled twice to America: for the signing on April 4 of the North Atlantic treaty and for the first meeting of the council set up under the treaty which met in Washington on Sept. 17. After the signing in April he attended the adjourned United Nations general assembly at Lake Success, New York, and his visit in September began with Anglo-American-Canadian financial discussions in which he and Sir Stafford Cripps (q.v.) led the British delegation. He spoke in the general debate of the fourth general assembly on Sept. 26 and, while in America made a short visit to Canada. On May 5 he signed the statute of the Council of Europe and in August attended the meetings of its committee of ministers at Strasbourg. He visited Berlin in May where he congratulated those who had taken part in the air lift during the Berlin blockade which was raised on May 12 and was present at the Council of Foreign Ministers which met in Paris from May 23 to June 20. He also attended meetings of the consultative council of the Brussels treaty powers—the meetings being held in each of the capitals of Great Britain, Belgium, France, Luxembourg and the Netherlands in turn—and in November again visited Paris for the committee of ministers of the Council of Europe and for a two-day conference on international affairs with Robert Schuman (France) and Dean Acheson (United States). On Dec. 27, he left London for Colombo for a meeting of the Commonwealth foreign ministers.

History. The state of Bhutan acquired during 1949 some importance as a barrier against Chinese Communism. As a result of negotiations started at Delhi in April 1948 between K. P. S. Menon, secretary to the Indian ministry of external affairs, and Debzunpon S. T. Dorji, head of the Bhutanese delegation, the Indian government concluded a new treaty with Bhutan which confirmed the old relationship, India agreeing to increase the annual subsidy from two to five lakhs of rupees (£37,500). The Bhutanese delegation had asked for eight lakhs. (W. Bn.)

Production. Wax, different kinds of cloth, Chowries, guns and swords.

Foreign Trade. Total trade with India (1948) estimated at over £65,000. Monetary unit: rupee.

BIDAUT, GEORGES, French statesman, (b. Moulines, Allier, France, Oct. 3, 1899), a leader of the M.R.P. (Mouvement Républicain Populaire, a French version of the Christian Democratic movement). He was minister of foreign affairs from Sept. 9, 1944, to July 19, 1948, and prime minister from June 19 to Nov. 28, 1946. (For his early career see Britannica Book of the Year 1949).

On Oct. 28, 1949, he was invested by the National Assembly as prime minister by 367 votes to 183. Immediately afterwards he announced the formation of his coalition cabinet (the 6th of the Fourth Republic and the 11th since the liberation), thus bringing to an end the longest cabinet crisis that post-war France had known (see also France).

BIERUT, BOLESŁAW, Polish politician (b. Rury Jeziuickie, near Lublin, April 18, 1892), provisional president of the republic from June 1945, was elected president by the parliament or Sejm on Feb. 5, 1947. (For his early career see Britannica Book of the Year 1949).

The merger congress in Warsaw on Dec. 15-22, 1948, elected him chairman of the new Polish United Workers' (Communist) party. On April 19, 1949, before the central committee of the party, he stressed that its main task in the struggle for peace was to fight resolutely against class enemies and foreign agents and the country must remain a faithful ally of the U.S.S.R. On Oct. 15, replying to a letter from Wilhelm Pieck and Ottó Grotewohl informing him of their election as president and prime minister of the German Democratic republic, he expressed the satisfaction of the Polish people that this republic regarded the Oder-Neisse line as the "frontier of peace." On Oct. 28, 10th anniversary of the "plebiscite" in eastern Poland, he sent telegrams to N. S. Khrushchev and N. I. Gusarov, secretaries

BIOCHEMISTRY. Notable progress was reported in 1949 in determining the intermediates in the chemical reactions by which the green plant under the influence of sunlight converts CO₂ and H₂O into O₂, sugar and other reduced carbon compounds. By growing plants in water which contained the O¹⁸ isotope, bio-chemists showed that the primary conversion of energy brought about by light involves the photosynthesis of water with the production of O₂. The subsequent reduction of CO₂ takes place in the dark as well as in the light.

In order to elucidate the path of carbon, growing algae were allowed to photosynthesize in the presence of radioactive C¹⁵O₂ for a limited time (5 sec. to 5 min.) and the reaction was stopped by dropping the plants into hot alcohol. The radioactive organic compounds which are progressively formed in increasing time intervals were identified by the newly developed methods of paper chromatography and radioautography. In these techniques substances are identified in terms of the distance which they migrate on a sheet of absorbent paper under the influence of a spreading solvent, and the positions of radioactive substances are determined by the darkened locations of an X-ray film subsequently placed in contact with the absorbent paper.

The first compound into which the radioactive CO₂ is fixed was found to be 2-phosphoglyceraldehyde; after 5 sec. at room temperature, four more compounds were found, 3-phosphoglycerate, malate, aspartate and phosphorvurate. After 30 to 90 sec. there were many additional compounds of which 15 were identified including sucrose, the first free sugar, several amino acids, alanine, serine and glycine, glycolate and the phosphates of fructose and glucose. These compounds all contained 2, 3, 4 or 6 carbons in a chain.

By selective degradation, the position of the radioactive carbons in several compounds was determined, and detailed mechanisms were worked out for the progressive entrance of CO₂ into increasing fractions of several molecules. Thus in sucrose, the radioactivity was found first in the middle carbons 3 and 4 of the hexose chain, later in carbons 2 and 5, and finally also in carbons 1 and 6.

The first photosynthetic reaction was thought to be the condensation of CO₂ with some reactive 2-phosphorus-containing intermediate, probably vinyl-phosphate, to form 2-phosphoglyceric acid. After conversion to phosphopyruvic acid, another molecule of CO₂ is added to form the 4-carbon oxalacetic acid, from which other 4-carbon compounds are formed, malic, aspartic, succinic and fumaric acids. One of these was thought to be split to form two 2-carbon intermediates, from which the 2-carbon vinyl-phosphate was regenerated to start the cycle over again. The hexose chain is thought to be formed by a reversal of the well-defined glycolytic cycle, the condensation of two triose-phosphates to form fructose-diphosphate.

Experiments were reported which showed that no more than four quanta (possibly only three) of red light, or a maximum of 4 x 44,000 = 176,000 calories of light energy, were required to produce one mole of oxygen gas equivalent to about 112,000 calories. This makes the efficiency of energy transformation at least 65%. (For three quanta the efficiency would be 85%). This refutes a prevailing view based on numerous experiments, that at least ten quanta are required for each mole of O₂ which would mean an efficiency of less than 25% and confirms a claim originally made for the higher efficiency by Otto Warburg in 1923. The high efficiencies were realized by illuminating a Chlorella suspension with white light of such intensity that photosynthesis just balanced respiration, and no net oxygen was evolved. A measured amount of red light was admitted and the increased oxygen corresponding to this red light, was measured.

Following the observation that the micro-organisms Tetrahymena gelii requires purines, and especially guanine, it was found that a modified purine, in which the NCN sequence of the 5-membered ring of guanine was replaced by NNN, was a powerful competitive inhibitor for guanine in the growth of this micro-organism. The name triazole was used to designate this type of compound and the guanine derivative was called guanazolo. The inhibition index was 0.075, which meant that 13 to 14 molecules of guanine were required to overcome the inhibition of one molecule of guanazolo. Normal mammalian cells have the capacity to synthesize their own guanine requirement. It was thought that if tumour cells were deficient in this capacity, then the administration of guanazolo, which emphasizes a guanine deficiency, might have a selective action in inhibiting the growth of tumour tissue, without interfering with normal growth. Repeated administration of guanazolo to mice over a three-day period did not have toxic effect. At 0.5 mg. of guanazolo was injected subcutaneously twice a day into mice with adenocarcinoma, a definite inhibition of the tumour growth was observed. Tumour size was reduced from 11 ml. size in the controls which received injections of saline, to 1 ml. size in the guanazolo treated animals, where it remained stationary for 20 days while the guanazolo was continued. The tumours resumed growth when injections ceased. Similar observations were made on spontaneous mammary cancer in mice, and in mouse lymphoid leukaemia. In the latter condition, guanazolo caused a definite decrease in white blood cell count, in the percentage of lymphoblasts and in the number of palpable tumour masses, as compared with control untreated mice. Tumour cells probably have an altered guanine metabolism, rendering them unable or less able than normal cells to synthesize this purine. (M. E. H.)
BIRLEY—BONN

BIOLOGY: see Bacteriology; Biochemistry; Botanical Gardens; Botany; Endocrinology; Genetics; Marine Biology; Paleontology; Physiology; Zoology.

BIRLEY, ROBERT, British educationalist (b. India, July 14, 1903), was educated at Rugby school and at Balliol college, Oxford, taking first class honours in history and winning the Gladstone memorial prize in 1924 with an essay on the English Jacobins. He became an assistant master at Eton college in 1926; when, in 1935, he was appointed headmaster of Charterhouse school in succession to Frank Fletcher, he was one of the youngest men ever to occupy such a post at a leading public school. He was a member of the Fleming committee on public schools and from 1947 to 1949 was educational adviser to the Control Commission for Germany where he was responsible for co-ordinating and supervising the re-education work in the British zone and in the British sector of Berlin. On Dec. 18, 1948, it was announced that the provost and fellows of Eton college had appointed him headmaster on the retirement of C. A. Elliott. Robert Birley took up his duties at Eton in Sept. 1949. In March 1949 he was given an honorary degree of doctor of engineering by the Technical university of Berlin. On Oct. 23 he broadcast the first of the Reith lectures for 1949. His subject for the four talks was “Britain in Europe: Reflections on the Development of a European Society.” He was created a C.M.G. on Jan. 1, 1950.

BIRTH STATISTICS: see Vital Statistics.

BISMARCK ISLANDS: see Trust Territories.

BOLIVIA. A land-locked republic in central South America. Area: 416,040 sq. mi. Pop. (mid-1948 est.): 3,922,000; one-third of the population is concentrated in the province of La Paz covering one-eighth of the total area. The legal capital is Sucre (pop., 1946 est., 32,000); the actual seat of government is La Paz (pop., 1946 est., 301,000). Other chief towns (pop., 1946 est.): Cochabamba (80,000); Oruro (30,000); Potosi (40,000). Estimation of racial distribution: Indian 52%, mestizo 28%; white 13%; Negro 0-2%; unclassified 6-8%. Language: Spanish, but the Indians speak Quechua and Aymara. Religion: predominantly Roman Catholic. President of the republic in 1949: Enrique Hertzog, until May 7; Mamerto Urriolagotia, acting president May 7-Oct. 19, thereafter constitutional president.

History. Political tension and violence, intimately linked with mounting labour unrest at the tin mines, characterized the Bolivian scene during 1949. The government was bitterly opposed by the leftist Partido de la Izquierda Revolucionaria (P.I.R.) and the rightist Movimiento Nacionalista Revolucionario (M.N.R.), both organizations being engaged in rivalry for political leadership of the miners' unions. President Hertzog declared a state of siege on Feb. 20, when the government unearthed a revolutionary plot sponsored by the M.N.R. After the congressional election of May 1, which gave the administration's Republican Socialist Union party a majority of the seats in the national legislature, Hertzog pleading reasons of health, requested a leave of absence. He was replaced on May 7 by Acting President Urriolagotia.

Urriolagotia decided in May to deport Senator Juan Lechin and 19 other M.N.R. leaders because of M.N.R.-led agitation among workers at the Catavi and Siglo Úniente tin mines. On May 28, unions at both mines staged a strike in protest against the deportation order. The stoppage was characterized by violent disorders at Catavi, where two U.S. mining engineers and about 50 Bolivian miners lost their lives. The government again proclaimed a state of siege on May 31, issued a general mobilization call and outlawed the opposition M.N.R. and P.I.R. parties and also the Communist party. The strike became general on June 1, when an estimated 8,000 organized factory and railroad workers walked out in sympathy with the miners, and grew until it involved some 27,000 organized workers. At length, on June 8, representatives of the government and the unions agreed to terminate the stoppage, the settlement calling for a reduction in the military forces stationed at the tin mines and the repatriation of Lechin and other exiled M.N.R. leaders.

An uneasy truce was broken on Aug. 27, when rebels led by the M.N.R. seized the cities of Cochabamba, Santa Cruz, Potosi, Oruro and Sucre. The revolt spread until the insurgents could claim on Sept. 1 that they controlled 2,000 troops and the western third of the country, embracing approximately 125,000 sq.mi. and a population of about 500,000. The bulk of the army remained loyal to the government, however, and by Sept. 3 loyalist forces had recaptured all major rebel strongholds except Sucre, Potosi and Santa Cruz. Sucre and Potosi fell to the loyalists on Sept. 4 and the insurgents abandoned Santa Cruz on Sept. 13. Acting President Urriolagotia announced nine days later that the revolt had been crushed and that “the country has now returned to normality.” Hertzog, his health broken, submitted his formal resignation from the presidency on Oct. 19. (C.I.B.)

BONAIRE: see NETHERLANDS OVERSEAS TERRITORIES.

BONN, a town on the left bank of the Rhine, 15 mi. south of Cologne, provisional capital of the German federal republic (Western Germany). Pop.: (May 17, 1939, census) 101,391; (Dec. 1949 est.) 110,000.

When the Parliamentary council assembled at Bonn on Sept. 1, 1948, to prepare a new German constitution, it was generally assumed that the provisional capital of Western Germany would be Frankfurt-on-Main, for long the place of election of the German emperors and seat of the first German parliament in 1848. But on May 23 the Western German republic was proclaimed at Bonn, and there also, on Sept. 7, was convened the newly elected parliament. On Sept. 30 the Bundestag decided, by 196 votes to 169 with 3 abstentions, to refer to a commission of enquiry the question whether Bonn or Frankfurt should become the provisional capital of the German federal republic. Although the commission reported that the choice of Frankfurt, with its greater accommodation facilities both for government offices and private dwellings and its better communications, would result in economies estimated at DM.100 million, the Bundestag decided on Nov. 3, by 200 votes to 176 with 11 abstentions, to retain Bonn as the provisional capital.
The new sanatorium-like Bundeshaus, or house of parliament, was formerly a modern teachers' college. It was completely overhauled and a new office wing, an assembly hall and a restaurant were added. Dr. Theodor Heuss (q.v.), the president of the federal republic, was housed at Viktorshöhe, near Godesberg, but for big official occasions he was to use the beautiful rococo Schloss Augustusburg, near Brühl. The question of Bonn's communications had caused some anxiety but by November the new bridge spanning the 800-yd. wide Rhine was finished and the new capital was connected with the Frankfurt-Cologne Autobahn by a broad new highway. Also an extra siding was built at Bonn on the Cologne-Mainz railway line to handle the increased traffic. As a third of Bonn's houses had been destroyed by air bombing the housing problem was acute and was being solved by repairing the old and building new dwellings. A well known Berlin architect, Max Taut, was in charge of a settlement for government officials on the Venusberg. Altogether, by Nov. 1, about DM.15·5 million had been spent by the government alone in building and other works in order to transform this quiet university city into a German Canberra. Dr. Hermann Wandersleb was the chief planner.

On Nov. 27 a new municipal theatre, in place of the one destroyed in an air raid in 1944, was opened. Bonn had many new cinemas, Konditoreien (coffee houses) and restaurants with music but no night clubs were authorized. The headquarters of the Allied High commission were on the 2,000 ft. Petersberg, in a former luxury hotel, on the right bank of the Rhine, a few miles to the southeast of Bonn.

BOOK COLLECTING AND BOOK SALES.

Most collectors do most of their buying from book-sellers; and the activity of both fraternities is geared to some extent to the auction season which lasts from early October to early July in London and is somewhat shorter in New York. The most distinguished sale held anywhere during the 1948-49 season took place in Dec. 1948, but the results of the most significant event of 1949—the devaluation of most European currencies in terms of the dollar—could hardly be estimated before the end of the 1949-50 season.

The collection formed in Paris by Cortlandt Field Bishop was sold not in London or Paris or Geneva, but in New York. It was full of beautiful continental books (the 18th century predominating over the 17th and 16th) of a kind and quality not seen in such profusion since the Rahir sales of 1930 and 1931, and the incongruity of its place of dispersal was reflected in the fact that about 80% of the books were bought by continental dealers. Other notable American sales were provided by the libraries of Fritz Kreisler and Frank Capra; and the outstanding single object sold during the year (for $54,000) was the Bliss ms. of Lincoln's Gettysburg Address, the fifth and final draft, signed in full. London auction sales were steady in volume, more than steady in price level, but unspectacular. Further instalments of the Landau library appeared; a beginning was made on the enormous mass of Sir Leicester Harmsworth's Americana; George Bernard Shaw showed a shrewd appreciation of the value added to books from his shelves by notes and inscriptions from his own pen; and the 27th portion of the library of Sir Thomas Phillipps marked the end of the sixth decade since dispersal of that huge hoard began. The fact that the whole remainder of the Bibliotheca Phillippica had been bought some years ago by a London bookseller was publicly confirmed by his issue of a catalogue of some of the contents.

The normal flow of rare books from the continent to Great Britain had been almost completely damped from 1939 to 1948, though an increasing traffic direct to America had been operating from 1946, mostly through emigre dealers in New York. During 1949 British booksellers and collectors found things a little easier; and some considerable holes were made in the zareba of exchange control regulations, import licences, etc., which isolated the country from the rest of Europe. Practical and concerted measures for enlarging these holes were among the agenda at the first plenary session of the International League of Antiquarian Booksellers held in London in September; and it was hoped that London's once pre-eminent position as an entrepôt of the antiquarian book trade might be at least partially retrieved.

Among British collectors the cyclic fashion for "press books" continued to ebb while the taste for bird and flower books, so strongly marked after World War II, seemed as vigorous as ever. Really fine 18th century first editions were scarce, 19th century scarcer, with fiction most difficult of all. The revival of general interest in calligraphy noticeably affected the prices asked for even mediocre writing books: those in good condition, because of their function, are
BOOK PUBLISHING

naturally always scarce. The market in “modern firsts” was brisk but well spread and showed few symptoms of hysteria or speculation. (J. Ck.)

Europe. Austrian dealers reported that, whereas formerly it had been possible to secure rare books in exchange for black-market staples, such trading had disappeared as a result of 1948 monetary reforms. Favoured by the newly decreed freedom of trade, the antiquarian book business in Western Germany showed stability, although east-west trade remained difficult. Leipzig, traditional book centre of Germany, was considered lost by western Germans who set out to establish a new centre in the west. Switzerland, which had enjoyed an increase in business representing that portion formerly executed by German dealers, reported a falling off as the German trade was re-established. In general, European dealers discovered that as living conditions improved they were able to buy fewer rarities from private owners.

United States. Sales of book collections in 1949 were fairly pedestrian. A notable exception was the auction in New York of the Fritz Kreisler collection of early printed books and manuscripts which realized $120,272. The highest auction price for a single piece was $54,000 paid (Parke-Bernet galleries, Inc., New York, April 27) for the MS. 223 R. of Lincoln’s Gettysburg Address. Purchaser of the manuscript was Oscar B. Cintas of Havana, Cuba. Four other copies of the Address are known: two in the Library of Congress, one in the Illinois State Historical library, one in Cornell university library. This last was presented to the library in June by Nicholas H. Noyes of Indianapolis, Indiana.

It was announced that Mark Twain’s private papers, including unpublished manuscripts, would be given to the University of California as a legacy by the author’s only surviving issue, Mrs. Jacques Samossoud. Another important collection, the papers of James Boswell, gathered by Colonel Ralph H. Isham, was acquired by Yale university libraries as a partial gift and would serve as the basis for the definitive edition of Boswell’s writings. The Olive Branch Petition, the appeal addressed to King George III by the American Colonies in an effort to resolve the differences that brought on the American Revolution, was presented to the New York Public library by Lucius Wilmending.

On March 31 a group met in New York and established the Antiquarian Booksellers’ Association of America. Regional chapters were established or projected in Los Angeles, New York city, Philadelphia, Chicago and Boston.

Devaluation of the pound seemed to have failed to increase trade between U.S. and British dealers. In the United States it was believed by many that since British prices were based on the dollar there could be small revisions in pricing. With devaluation, some British dealers revised prices upward.

BOOK PUBLISHING. In Great Britain 1949 was the year in which book publishing, which had assumed some strange patterns during the preceding ten years, was restored to its normal appearance. On March 6 the rationing of paper for books (which had been introduced nine years earlier, on March 3, 1940) came to an end. This long-awaited liberation from governmental control came too late to cause much jubilation. Already by that date paper rationing had ceased to be a real problem for the vast majority of publishers, all of whom were now more concerned with steadily mounting manufacturing costs at a time when any proportionate rise in selling price to meet those costs would be particularly unwelcome. Publishers had to base the selling price of a book on the number of copies they could reasonably hope to sell in relation to the costs of manufacture. During the years of book shortages every publisher knew that he would sell practically every copy of every title he could manufacture and he fixed his prices accordingly. The result was that during those years such increase in published price as occurred bore little relation to the increase in costs. By 1949, however, there was no shortage of books. Students and other specialist users of books might still find difficulty in securing a particular book; but the general reader’s requirements were abundantly catered for. After having been unconsidered for nearly a decade the element of risk once again re-occupied its important place in publishers’ calculations. Books that had failed to find a purchaser began to accumulate in the bookshops and the burning trade question throughout the year was this matter of “overstocks.”

Despite all this, the publishing business continued quarter by quarter to beat all previous records. The amount of trade done by publishers in 1948 reached the unprecedented figure of £33,241,431. (The prewar average annual total was approximately £10 million.) During the first six months of 1949, publishers’ total sales amounted to £15,849,367, an increase by over £400,000 on the turnover during the corresponding period of 1948. Since book trade business is invariably greater during the second half of the year than in the first, there was little doubt that the 1949 total would surpass the 1948 record. An analysis of publishers’ output made by the book trade paper, the Bookseller, showed the average price of books published during the first six months of 1949 to be 10s. 11d. In the following six months the average price was 11s. 4d.

Total turnover figures do not by themselves reflect the prosperity of the book trade but must be considered in relation to the number of titles over which the business is spread. The table shows the turnover figures for the 12 years 1937-48 in conjunction with the total number of titles (including reprints and new editions) recorded by the Bookseller for those years.

The production of books in Great Britain during 1949 was 17,034 titles, of which 5,110 were reprints and new editions. The total was considerably greater than the output for recent years and was very little short of the figure for the record year 1937 (17,134 titles). The notable increase in the output of titles was watched with growing apprehension by the book trade, which painfully recalled that the worst of its misfortunes during the difficult ‘thirties had been due to over-production of new titles. On the other hand, some postwar expansion of the book lists was inevitable and indeed desirable. Of the year’s 5,000 reprints many were badly needed to replace the standard works which were casualties of the paper shortage; and of the 12,000 new books published during 1949 a substantial number were books arranged for in previous years, whose appearance had had to wait the easing of paper, printing and binding difficulties.

The amount of export business done by British publishers in 1948 was £8,739,236, or 26.3% of the total. The largest
overseas market for British publishers, Australia, was worth well over £1½ million in 1949. Other overseas markets in order of importance were: South Africa, India, U.S.A., New Zealand, British Africa, Scandinavia, Ireland, Canada, middle east, Netherlands, central Europe, France, Malaya, South America, British West Indies, Belgium, Italy, Switzerland, Asia, the Balkans, Spain, Portugal, Germany, Africa (non-British), central America and Iceland.

Europe. Publishers in European countries as well as in Great Britain found themselves enjoying in 1949 a relief from the shortages of raw materials that had restricted their activities for so long and, in spite of a shortage of printing plant that still prevailed in a number of countries, were able to allow their own tastes and traditions in style rather than considerations of economy to govern their book production.

During the year official reports from eastern Europe claimed that book production was flourishing under the new regime and that demand had never been higher. The most detailed account of the book trade in any of these countries was provided by the Czechoslovak Publishing act, passed in March 1949, which invested in the Ministry of Information and Public Culture full powers to plan and direct book publishing and bookselling to the exclusion of all independent production and distribution.

Although there were now fewer obstacles to book production in Europe, those which impeded the free flow of books from country to country, such as tax barriers, import restrictions, etc., remained formidable. The removal of some of these barriers was one of the principal concerns of the United Nations Educational, Scientific and Cultural organization, and at the Cultural conference of the European movement, held at Lausanne in Dec. 1949, the conference unanimously declared its conviction that it was “vital to the well-being of Europe that all such restrictions should be swept away.”

United States. Title production in 1949 was 10,892 (9,897 in 1948), the highest total since 1941. The largest increase over the preceding year was in the category of sociology and economics, followed by books on science, business, biography and domestic economy. The decreases appeared in the fields of music, and domestic and military subjects. The number of fiction titles was 1,644 (1,643 in 1948), but there were fewer new titles and more new editions.

Based on trade sales alone, the list of fiction best sellers for 1949 was headed by The Egyptian, a novel laid in ancient Egypt and translated from the Finnish of Mika Wartari. This was followed by Lloyd C. Douglas' The Big Fisherman, which moved from first place in 1948 to second place in 1949; in third place came Sholem Asch's Mary. First on the list of non-fiction best sellers, rated by trade sales alone, was White Collar Zoo by Clare Barnes, Jr., a series of animal photographs humorously captioned to relate them to familiar office types and office situations; its immediate success brought a sequel in Home Sweet Zoo, which proved another best seller.

Although non-fiction sales through the book stores were larger in 1949 than fiction sales, five of the ten non-fiction best sellers were not literary books: two were picture books and three were instruction on how to play canasta, a new and very popular card game.

In 1949, as in 1948, books with a religious or biblical interest accounted for two of the fiction and four of the non-fiction best sellers.

Borneo: see British Borneo; Netherlands Overseas Territories.

Botanical Gardens. The long summer drought of 1949 caused some losses in the larger gardens, particularly in the south of England. Many bulbs and shrubs, however, that benefit from a warm summer, gave an unusually fine display.

At the Royal Botanic gardens, Kew, Dr. J. Hutchinson retired from the keepership of the museums after 44 years' service at Kew. He was succeeded by Dr. F. N. Howes. The director, Sir Edward J. Salisbury served as a vice president of the Royal Society as well as being its senior secretary. Work in the Herbarium returned to, or even exceeded, prewar quantity and quality and the Kew Bulletin, no. 1, 1949, reported that over 35,000 specimens were received during 1948. Three further important papers on the “Classification of the Bananas” by E. E. Cheesman of the Imperial College of Tropical Agriculture, Trinidad, were published in the Kew Bulletin, nos. 1, 2 and 3, 1949. Determinations of plants from collections by P. H. Davis in the Mediterranean and the near east as well as from the collections of Christopher Sanderman in South America and those of the Oxford university expedition in Sarawak were also given in the Kew Bulletin.

In South Africa continued efforts were made for the preservation of the rarer members of the native flora and a large collection of these were grown in the National Botanical gardens at Kirstenbosch, Cape Province, from which many South African plants and seeds were sent out to other institutions during the year.

A number of notable plants flowered during 1949 in the Edinburgh Botanic garden and a further part of the revision of the Series of Rhododendron was prepared by the assistant keeper, Dr. J. Macqueen Cowan and H. H. Davidian and published in the Rhododendron Year Book, no. 3, 1949, of the Royal Horticultural society. This section dealt with the Campanulatum and Fulvum series.

At the Wisley gardens, belonging to the Royal Horticultural society, the blooming of late summer South African bulbous plants such as Amaryllis Belladonna and Nerine Bowdenii was unusually fine. A tetraploid form of the scarlet Salvia splendens was produced by the Cytological department at Wisley and showed more vigour and size than the diploid plant. This was shown for the first time during the year under the name Wisley Tetraploid.

In Berlin, progress was made in the reconstruction of the botanical garden and museum at Dahlem under the directorship of Dr. R. Pilger, and a report on the portion of the scientific collections that was saved was published in the Kew Bulletin, no. 2, 1949.

United States. A new arboretum was initiated by the park department of Spokane, Washington. A tract of nearly 100 ac. was set aside for this purpose. Various organizations in Denver, Colorado, were working very hard to have an area of one of the city parks set aside for an arboretum. The tract under consideration included nearly 100 ac. of park land between the Museum of Natural History and the Zoological garden.

No major changes occurred in the larger arboreums and botanical gardens of North America during the year, but the Lexington Botanic garden at Lexington, Massachusetts, was being discontinued owing to lack of operating funds. (See also Horticulture.)

Botany. During 1949 all branches of the science contributed to an imposing bulk of published research in which notable advances were reported in the study of antibiotics, plant diseases and palaeobotany. (See Palaeontology.)

The Botanical Society of the British Isles commenced publication of a new periodical Watsonia for contributions bearing on the taxonomy and distribution of British vascular plants and charophytes. The discovery of Myriophyllum verrucosum, an Australian aquatic, was reported from gravel
pits in Bedfordshire and it was suggested that the plant was introduced with wool shoddy which is extensively used in the neighbourhood as manure. *Equisetum ramossissimum*, a native of the Mediterranean basin and southern Europe, was recorded from a locality in Lincolnshire. The society also published a report of a conference on British flowering plants and modern taxonomic methods, which contained observations by experts on critical groups.

The Linnean society and the Systematics association held a joint meeting in London to discuss cytolgy in relation to botanical and zoological taxonomy. W. B. Turrill defined the aim of the taxonomists and reviewed the problems raised by sterility, apospices and polyppody. F. C. Stern showed how the number and shape of chromosomes helped to distinguish critical species which otherwise were difficult to distinguish. He suggested that the genera *Leucojum*, predominantly western Mediterranean, and *Galanthus*, predominantly eastern Mediterranean, had diverged from a common ancestral type which had been driven south in glacial times.

Professor Lily Newton delivered the presidential address to the Botany section at the British Association meeting at Newcastle-on-Tyne on "The utilization of the macroscopic marine alge through the ages." Seaweeds served as food in the east and as fodder and manure in the west from very early times, and Professor Newton described in detail the many uses to which they had been put in various parts of the world and the latest work, particularly in Great Britain, to exploit commercially the marine alge around the shores of Britain.

J. Allison and H. Godwin identified tubers of *Arpha-therum tuberosum* and grains of a six-rowed barley in a sample of carbonized plant material from an Old Bronze Age site in Wiltshire. From a Middle Bronze Age site in the same county they recorded a sub-fossil seed of *Veronica hederifolia*.

P. W. Brian found that Griseofulvin, a metabolic product of several species of *Penicillium*, in concentrations of 0.1-10.0 \( \mu \text{g} / \text{ml.} \), had a profound influence in the morphogenesis of many fungi. No effect was observed in the treatment of the comyces, actinomycetes and bacteria but the product was found to be appreciably toxic to some angiospermic seeds.

E. J. H. Corner suggested in his Durian theory that it was possible, from a study of tropical fruits, to trace the gradual evolution of the modern tree form. He argued that the primitive angiosperm fruit must have been a red fleshy follicle with large, black red-arillate seeds suspended on persistent funicles. The primitive angiosperm was a tropical cycad like mesophyte with large pinnate leaves and bearing a cluster of large arillate follicles.

S. Dickinson, investigating the stimuli determining the direction of the growth of the germ tubes of rust and mildew spores, concluded that three tropisms were involved, positive hydrotropism and two types of growth response due to contact. He also studied the behaviour of germ tubes of certain nests and found that the formation of appressoria, of substomal vesicles and of infection hyphae were induced by contact stimuli. He described how the mycelia of two rusts on removal of their host epidermies were unable to grow out of the infected host disease.

D. Doxey studied the effect of isopropyl phenyl carbonate on myosis in rye and onion and described the resulting mitotic irregularities. These included interference with centromere action and spindle suppression resulting in paired chromosomes and polyploid nuclei. The effects were compared with conditions found in certain types of tumour.

On the controversial subject of per-glacial survival of certain components of the British flora H. Godwin showed that new evidence regarding the former wide range of species, which were now much restricted, presented the problem as one of explaining post-glacial movements and adjustments rather than of per-glacial survival.

J. W. Heslop Harrison recorded *Potamogeton ephydurus* from the Outer Hebrides. This was a most interesting addition to the British flora as it is one of the few species which are predominantly north American in their distribution and which reach extreme western Europe.

C. C. Harvey and K. M. Drew reported the first occurrence on the English coast of the red algal genus *Falkenbergia* as an epiphyte on a piece of Floridian alga.

Knud Jønsen published his studies in late Quaternary deposits and flora history of Ireland. From detailed examination of the plant remains in post-glacial deposits in a number of widespread bogs and peat deposits, he had traced the changes in the flora to recent times, and listed the species found in the various zones. He considered that certain constituent elements in the present day Irish flora, including the Atlantic and Lusitanian species, might have survived the last glaciation.

J. A. Macdonald investigated the heather rhizomorph fungus *Marasmius androsaceus* which grows where the heather is wet and attacks old plants more commonly than young ones. It was found that a burned area of moor was unaffected while the neighbouring unburned area was severely infected.

P. S. Nutman studied nodule formation in red clover, and suggested that bacteria penetrated the root and produced nodules only within those zones of the root distinguished by the presence of growing root hairs and only at points of incipient meristomatic activity.

T. R. Peace and J. S. L. Gilmour studied the effect of picking on the flowering of the bluebell *Scilla non-scripta* and found from independent observations in two separate localities that neither picking nor pulling had any deleterious effect on flower production over a period of years.

M. E. D. Poore and V. C. Robertson gave an account of certain aspects of the vegetation of St. Kilda to show the changes subsequent to the evacuation of human inhabitants in 1932.

J. E. Raven, after visiting the Isle of Rhum, indicated that several of the rare and interesting plants reported from the island in recent years had been introduced.

K. R. Sporne, in a statistical analysis of floral and vegetative characters of the families of Dicotyledons, suggested that there were significant correlations in an assessment of relative advancement. On this basis *Dipsaceae*, *Labiateae* and *Valerianaceae* were shown to be amongst the most advanced families, and *Flacouriaceae*, *Anonaceae*, *Magnoliaceae* and *Euphorbiaceae* to be amongst the most primitive.

J. Walton described the ovuliferous fructification of *Calathospermum scoticum* and indicated its significance in the interpretation of carpel morphology. He also described *Alcioonorthorus Hallei* from the Lower Carboniferous of Dumbartonshire and referred the species to the *Pterido- spermeae*. It was the first example known of a fairly complete microsporangial fructification to be found in a petrified state.

C. W. Wardlaw described experimental and anatomical investigations on leaf formation of phyllotaxis of *Dryopteris aristata* Druce and, on the data available, rejected the hypothesis of other workers.

S. Williams recorded the occurrence of a completely saprophytic liverwort, probably *Cryptothallus mirabilis*, from Dumbartonshire, Scotland. It was found embedded up to three inches in black amorphous peat on the site of a felled wood. (See also HORTICULTURE.)

G. TLR.)

BOWLS. In 1949, 2,026 clubs were affiliated to the English Bowling association. The national championships held at Paddington, London, from Aug. 15-23, attracted 47,108 entries. A. Allen (Oxford city and county) won the singles by 21-8, A. Collins (West Ealing) being the runner-up. Darlington won the pairs, Worthing pavilion the triples, and Skefko, Luton, the rinks. The International tournament, played at Preston park, Brighton, on July 6-8 for the News of the World trophy was won by England on points average, England, Scotland and Ireland each winning two games and losing one. The London and Southern Counties Bowling association’s gold badge was won by N. Miller (Lyons), and the Lonsdale trophy by A. C. Thwaites (Century). The national Welsh B.A. singles was won by Evan Rees of Neath, the pairs by Briton Ferry Steel, and the rinks by Victoria park, Cardiff. The Irish B.A. singles was won by R. Miller (Bangor B.C.).

In 1949, 351 clubs were affiliated to the English Women’s Bowling association. Mrs. Chillman won the national championship singles, also the two-woods. Mrs. Winslow and Mrs. Homes, of Wiltshire, the pairs, Dorset the triples and Warwickshire, the rinks.

BOXING. A remarkable feature of boxing at the end of 1949 was that Bruce Woodcock, the British heavyweight champion, despite a much chequered career and suspect nervous reflexes, was regarded by the authoritative New York State Athletic commission as one of three contenders for the world championship. The New York body declared the title vacant after the retirement of Joe Louis and refused to alter their attitude although the American National Boxing association, to which all other states are affiliated, accepted the Negro, Ezzard Charles, as Louis’s successor by virtue of his victory over Louis’s old opponent, Joe Walcott, in a fight Louis himself promoted. The N.Y.S.A.C. would only recognize Charles as champion if he beat the winner of the contest Woodcock v. Lee Savold, arranged for May 1950. It was postponed from Sept. 1949 after Woodcock had been involved in a road accident. This accident produced a post-concussional condition and, adding to the damage inflicted on him in a fight with Joe Baksi in 1947 after which he suffered from optic nerve and visual trouble, gave him considerable anxiety. Woodcock only came back to the ring late in 1948. After knocking out the South African, Johnny Ralph, early in 1949, a conquest that did much to restore his confidence, he successfully defended his British title against Freddie Mills in June 1949.

Mills, who was the world champion cruiserweight, had an inactive year in 1949. His only important fight was against Woodcock, to whom he conceded more than a stone in weight and much in height and reach. He was to defend his world title against Joey Maxim, American challenger, early in 1950. Among young heavyweights were Jack Gardner, Johnny Williams and Don Cockill. Dick Turpin, verging on 30, withstood the challenge for the British middleweight championship but seemed unable to make further headway. Meanwhile his fiery young brother, Randolph, now of age, fought his way towards the highest honours in the middleweight class. The spectacular hard-hitting conquests of Pete Mead, the American, and Cyril Delannoite, the former European champion, put Randolph Turpin in line for a match with Dave Sands, of Australia, which the promoters tried to establish as a final eliminator for the world championship held by Jake la Motta, who won it from Marcel Cerdan (see OBITUARIES). The British welterweight championship changed hands when Eddie Thomas defeated Henry Hall in an uneven fight. Billy Thompson who fought rather unevenly, remained the British lightweight champion but lost the European title and failed to regain the Empire title in 1949. His next British challenger might have been Tommy McGovern. It was a pity that the best of the Amateur

Players taking part in the national championships of the English Bowling association which were held at Paddington, London, in Aug. 1949.
BOY ORR, JOHN BOYD ORR, 1st Baron, of Brechin Mearns, Angus, British scientist and authority on nutrition (b. Kilmours, Ayrshire, Sept. 23, 1880), became director of animal nutrition research at Aberdeen University in 1914 and in 1929 founded and directed the Imperial Bureau of Animal Nutrition. He was made rector of Glasgow University in 1945 and chancellor in 1946. On Oct. 27, 1945, he was unanimously elected director general of the Food and Agriculture Organization of the United Nations for a two-year term ending Dec. 31, 1947. In 1949 he visited India at the invitation of the Indian government to advise on food problems. His proposals which were accepted and implemented by the Indian government, were that the production and distribution of food should be organized on a war basis. In Oct. 1949 the Nobel committee of the Norwegian Parliament announced that he was to receive the Nobel Peace Prize for 1949. Following the usual practice the reasons for the award of the peace prize were not made public; but it was believed that it was given both for his work as director general of the Food and Agriculture Organization and also as president of the world movement for a world federal government. A barony was conferred on him on Jan. 1, 1949. (See Britannica Book of the Year 1949.)

BOY SCOUTS. Scouting in Great Britain and the Commonwealth continued to make steady progress during 1949. In British membership reached 473,216, the highest in the movement’s history. An encouraging sign was an increase of 4,705 on the previous year in the number of adult leaders.

A “Bob-a-Job” week held in April, when every member of the movement was asked to earn at least one shilling towards administration costs by doing odd jobs, was an enormous success both from the financial viewpoint and from the amount of goodwill that accrued to scouting.

In its role of encouraging international friendship scouting was very active. At the beginning of the year a highly successful Pan-Pacific Jamboree was held in Australia. In August nearly three thousand Rover scouts (Aug. 17-25) from 30 countries camped together at Skjak in the mountains of Norway at the Fourth World Rover Moot. A record number of British scouts camped abroad as guests of foreign scouts.
BRADLEY—BRAZIL

and many scout visitors from other countries camped in Great Britain.

The council of the Boy Scouts association gave their sanction to a few minor changes in the scout uniform. Scouts over 15 and scout leaders could now wear berets on informal occasions such as camps and hikes, but the familiar wide-brimmed hat introduced by Lord Baden-Powell continued to be worn on all formal occasions.

United States. Boy Scout anniversary week was an outstanding event in 1949. Twelve scouts visited President Harry S. Truman and presented a "Report to the Nation" on scouting civic-service projects carried on during 1948. These scouts later presented a report to the United Nations at Lake Success, New York, on service to scouts abroad.

In May it was announced that age levels in the three age groups of scouting were to be lowered by one year. Cub scouting would be for boys 8 to 10 years of age; boy scouting for boys 11 to 13; and exploring, which would combine all the features of the previous older scout programme, involving air, sea and land activities, would be for those of 14 years and older.

Membership on Oct. 31, 1949, was 2,322,094 persons organized in 69,185 scouting units. There were 1,709,950 boys and 612,144 leaders.

BRADLEY, OMAR NELSON, U.S. general (b. Clark, Missouri, 1893), graduated from the U.S. Military academy at West Point in 1915 and became a major of infantry in World War I. He graduated from the Infantry school (1925), the Command and General Staff school (1929) and the Army War college (1934), taught at West Point until 1938 and then served in Washington on the general staff. During World War II he commanded the 2nd corps in north Africa and Sicily and subsequently all U.S. ground troops for the invasion of northwestern Europe. As commander of the 12th U.S. army group, he commanded more than 1,300,000 combat troops—the largest number of U.S. soldiers ever to serve under a single field commander. In 1945 he was promoted full general. From Aug. 1945 to Dec. 1947 he was administrator of veterans' affairs and on Feb. 7, 1948 he succeeded General of the Army Dwight D. Eisenhower as army chief of staff. On Aug. 16, 1949, he became first permanent chairman of the U.S. joint chiefs of staff. At the end of July and early August, Admiral Louis Denfield, Air Force General Hoyt S. Vandenberg and General Bradley visited Frankfurt, London and Paris to "discuss matters of mutual interest, including the proposed military organization under the North Atlantic treaty," to "acquaint themselves with current conditions in Europe," and to "gain first-hand information of the state of the U.S. forces in Europe." At the first session of the Defence committee set up under the North Atlantic treaty in October Bradley was made chairman of the Military committee which would "commence planning under a broad concept for the integrated defence of the North Atlantic area."

BRAZIL. The largest of the Latin American republics, the United States of Brazil has a common frontier with all South American countries except Ecuador and Chile. Area: 3,286,170 sq. mi. (48.3% of the whole of South America). Population: (1940 census) 41,570,341; (mid-1949 est.) 49,350,000 (see Table); about 13% was classified as urban and the remainder as rural; three-fourths of the population is concentrated in an area along the Atlantic coast, where the principal towns are located. The nationality of the population as shown by the 1940 census was: Brazilian born 39,822,487, naturalized 122,735, foreign 1,283,833, nationality unknown 7,260. Among the foreign-born residents there were c. 354,300 Portuguese, 285,000 Italians, 147,900 Spaniards, 141,600 Japanese, 71,000 Germans, 41,000 Poles and 245,000 citizens of other countries. Among the Brazilian-born population, about half was of European stock; the remainder included 8,744,400 mulattoes (21%), 6,035,709 Negroes (14.6%), 5,500,000 Indians and mestizos (13%), and 250,000 Asians. Language: Portuguese. Religion: predominantly Roman Catholic (94.4%), with over one million Protestants of various denominations and 110,800 Jews. Capital, Brasilia, 38,315 in 1947 (1940 est.), is on the site of an early state capital. By 1950 population was 96,916 (1950 census). President of the republic, General Eurico Gaspar Dutra (q.v.).

*Area in dispute between the states of Minas Gerais and Espírito Santo*

History. Since early 1948, when an inter-party agreement for co-operation with the legislative programme of President Dutra's administration was signed by leaders of the National Democratic union (U.D.N.), the Social Democratic party (P.S.D.) and the Republican party (P.R.), the country's political life had been conditioned by the bickering between party leaders over the selection of candidates for presidential elections. The Superior Electoral tribunal announced that these were to be held on Oct. 1, 1950. It declared publicly that he would not seek re-election. Aware of the fact that none of the existing parties was strong enough to expect to win alone at the polls, the president endeavoured to bring about a united front of the three principal parties (U.D.N., P.S.D. and P.R.) backing a common presidential candidate. Leaders of the three parties found it impossible to agree on the same candidate. Numerous conferences, interviews, round-table and private talks took place in Rio de Janeiro and the various state capitals but to no avail.

At the end of the year it was suggested that the leaders of the P.S.D. (Dutra's own party) should agree on a list of four candidates from the state of Minas Gerais whom the party would be willing to support. The U.D.N. would pick one of the four suggested candidates and the two parties would then agree to support the selected candidate at the polls.
This formula was rejected by U.D.N. leaders as well as by Vice-President Nereu Ramos, who was chairman of the P.S.D. and himself an avowed candidate to the presidency. Meanwhile, Ademar de Barros, the governor of the state of São Paulo, announced that he was not quite decided whether to be a candidate or not although his party, the Social Progressive, had set up a well organized campaign committee with allegedly ample funds to draw upon. It was persistently rumoured that the governor of São Paulo, if he chose to run, would have the backing of former director Getulio Vargas and the Brazilian Labour party (P.T.B.). At various places, including the federal capital, groups of students paraded the streets loudly proclaiming Brigadier Eduardo Gomes as the only possible candidate of the people. Whether Brigadier Gomes, the U.D.N.'s defeated candidate in 1945, again would consent to become a presidential candidate was not certain. As the year drew to a close, the political situation in the country, could be classified only as confused.

Internationally, Brazil continued to pursue its traditional policy of friendship towards the United States, support for the United Nations and co-operation in the Pan-American movement through the Organization of the American States. In May 1949 President Dutra journeyed to the United States in response to an invitation of President Harry S. Truman. His 10-day stay was marked by numerous expressions of friendship between the two peoples. While in Washington President Dutra addressed a joint session of the U.S. congress.

On March 10 it was announced that the Joint Brazil-United States Technical commission had completed its task and had submitted its report to the governments of Brazil and the United States. The report pointed out that the need for a broad development programme in Brazil was indicated by the low productivity and small income of the majority of its people and a serious lack of balance in its economic structure. The commission unanimously agreed that the economic development of the country should be accelerated by a carefully considered programme of government expenditures, by policies favouring a balanced development of the country's resources by private enterprise and by policies directed specifically toward controlling inflation and meeting the balance of payments problem.

(R. D'E.)

Education. Schools (1947): primary 58,502, teachers 112,412, pupils 4,437; most of these schools were to be found in the states of São Paulo (10,013), Minas Gerais (8,489) and Rio Grande do Sul (8,127); secondary, approximately 1,500 pupils 300,000; vocational 2,700, pupils 200,000; state universities 7; private (Catholic) universities 3.

Agriculture. Main crops ('000 metric tons, 1948): coffee 945; cotton 308; rice 2,150; maize 5,511; sugar 1,840; cocoa 96; tobacco 117. Livestock ('000 head): cattle (Dec. 1947) 45,000; sheep (Dec. 1947) 18,000; horses (Dec. 1946) 6,770; pigs (Dec. 1947) 5,000.

Industry. Persons employed (1941) 944,318. Fuel and power: coal ('000 metric tons, 1948) 2,015; consumption of gas in Rio de Janeiro and São Paulo ('000 cu. ft., 1948) 6,180,029; consumption of electrical energy in Rio de Janeiro and São Paulo (kwh. 1948) 2,453; crude oil output (metric tons, 1948) 18,750. Raw materials (metric tons): rubber, export (1948) 5,150; manganese ore (1947) 451,430; chrome ore, export (1946) 174; pig-iron (1948) 521,700; steel ingots and castings (1948) 662,000; gold (fine Troy oz. 1948) 130,000; diamonds (carats, 1947) 275,000. Manufactured goods: cotton textiles (1947) 1,005 million sq. m.; cement (1948) 1,113,000 metric tons.

freight net ton-mi. (1948) 4,569 million. Shipping (July 1948) merchant vessels of 100 tons and upwards 342, total tonnage 709,012. Air transport (1948), hours flown 244,000, m. flown 17,649,000; passengers flown 946,600, cargo carried 14,090,000 kg, air mail carried 712,000 kg. At the end of 1948 there were 8 foreign and 23 domestic airlines serving 157 places. Telephones (1948) subscribers 468,500. Wireless working expense (1948) £500,000.

**BREAD AND BAKERY PRODUCTS.** During 1949 there was no change in the extraction rate of flour in Great Britain and from 100 lb. of wheat the miller had to provide 85 lb. in the form of flour suitable for human use and thus to produce only 15 lb. of by-products available for the feeding of animals. This rather dark, long extraction flour could not be expected to produce the bold quality loaf which was made in prewar days; but it was claimed that the loaf, although not so liked by the public, was of good nutritive value—a claim which few would deny. It was indeed to the credit of the British miller that he was able to restrict at his disposal—the sources of supply being only five (United States, Canada, Argentine, Australia and home grown wheat) as against 40 before 1939—he continued to make, at this high extraction, flour of as good baking quality as he had.

There was no outstanding change affecting bread and confectionery although as regards the latter there was a tendency for supplies of sugar etc. to be rather more plentiful. Nevertheless supplies were still much below the prewar standard. Following the general trend, more and more bread was being produced in the large fully automatic bakeries and indeed this might have reached in 1949 a total approaching 70% of the whole. In such bakeries, the dough was made in electrically driven mixers, divided by machinery, moulded mechanically, given its final proof or fermentation in automatic provers and finally baked, untouched by hand throughout, in a continuous "travelling" oven. In Great Britain bread wrapping was prohibited during the war but from Nov. 1 this was permitted once again.

In the United States great interest was aroused by the use of "softeners" to counteract or delay the effect of staling and enquiries were proceeding to determine their desirability in all respects. In Great Britain and Australia much needed and far too long delayed research institutes dealing with bread manufacture were formed. (See also Flour.)

(D. W. K.-J.)

**BREWING AND BEER.** The downward trend of beer consumption since 1946 was masked rather than arrested during 1949. Consumption in terms of bulk barrels during the first three months amounted to little more than 70% of that during the corresponding months of 1946. The revenue from the beer duty, it was estimated, must have been on average about £1 million lower each month than it was in 1948. The time evidently was ripe, or over-ripe, for a reduction in the beer duty and in April the chancellor of the exchequer announced the first reduction since 1933—one of 2½ a bulk barrel. The price to the public was to be lowered by 1d. a pint, which meant that the brewing industry was called upon to bear a loss of 3s. a barrel.

Almost immediately consumption went up to near the 1948 level. May 1949 consumption was very little below that in 1948; so was the June consumption. In July, output was 84,000 bulk barrels above that in July 1948. Much the same level was maintained until September. The chancellor's policy in reducing the duty by no more than a "penny off the pint" appeared to be justified. In the trade, however, there was no experienced brewer or licensed victualler who would have ventured an opinion as to how far the improvement had been caused by the reduction in price and how far by the phenomenally fine hot summer. This caution was justified by the October consumption; this was smaller, in relation to 1948 monthly output, than that of any other month since the reduction of the duty. Later experience bore out the impression that a more drastic reduction in the duty (which at 8½ a pint was still four times as high as in 1939 on beer of average strength at the respective times) would be necessary if the decline in consumption was to be permanently arrested.

The Licensing act passed during 1949 gave the home secretary power to set up State Management areas in districts scheduled as new towns but, in response to popular feeling shorn of the more far-reaching clauses that would have made it possible to surround the new towns with wide belts of state-managed areas. Criticism of the so-called "tied house" system appeared at first to meet with some support. This criticism dwindled as the Brewers' society in a series of soberly-phrased statements pointed out that "tied" houses were generally let at very low, often personal, rents and that tenants possessed such advantages as a business of their own.

under-brewed balances by some breweries. In the trade the view was held that as there was no longer a shortage of barley, brewers should be freed from the government restriction limiting them to producing beers of 85% of the average strength of the beers they brewed in 1939. This would have enabled them to brew beer to their customers' tastes, since beer drinkers' tastes varied widely between one town and district and another.

By a "gentleman's agreement" with the National Farmers' union, the brewing industry paid not less than 10c. a quarter above the statutory minimum for all barley used for brewing, both for the 1949 and 1950 crops.

The provisional receipts from the beer duty during the financial year 1948-49 were £295 million and from the Liquor Licences duty, £5,049,000. Receipts for the year 1949-50 from these two sources were estimated at £267 million and £4,900,000 respectively (X.).

**United States.** Beer and ale sales for the fiscal year ending June 30, 1949, totalled 85,809,068 bbl., the second highest fiscal year figure on record. Highest figure was 86,992,795 bbl. in 1948. Bottled and canned beer accounted for 70% of the 1949 fiscal year sales total.

The consumption of malt beverages had increased by about 34 million bbl. since 1939. The entire increase was accounted for by packaged sales, made largely in food stores for home consumption, although a considerable volume of packaged as well as nearly all of the draught beer was sold through taverns.

For the first eight months of 1949, all indications pointed to a record year for beer and ale sales. Withdrawals at that point totalled 58,411,593 bbl., topping by more than 500,000 bbl. the previous record sales of 57,880,644 bbl. August registered the highest single month's sale of beer in the nation's history, with 8,901,000 bbl.

A development of major interest to the industry during 1949 was the introduction of courses in brewing sciences in several universities. These courses were similar to those offered for many years by the University of Birmingham in England.

The U.S. bureau of the census of manufactures' figures for 1947, the latest available, showed that the industry in that year paid out $292 million in wages and salaries, as compared with $122,300,000 in 1939, and expended $620 million for materials, fuel, new plant and equipment, as compared with $182,300,000 in 1939.

Federal excise and special taxes on malt beverages for the fiscal year 1949 totalled $690,797,422. Beer and ale were in 1949 taxed at $8 a barrel. (See also Hops.)

**BRIDGES.** In connection with the hydro-electric schemes of the North of Scotland Hydro-Electric board, three reinforced concrete bridges were completed during 1949. In Perthshire, near Pitlochry, the Aldour bridge was built across the river Tummel to replace the old Clunie bridge which would be submerged by the Loch formed by the Pitlochry dam. Built in a style similar to the Waterloo bridge, London, it was a three span, low arch, reinforced concrete structure with an overall length of 301 ft. 6 in. The centre span was 94 ft. and the two anchor spans 77 ft. 6 in. The bridge had an open railing parapet.

In Dumbartonshire, a bridge was needed to carry the trunk road from Balloch to Crianlarich over the tailrace of the Loch Lloy power station. The bridge had two spans and was built of reinforced concrete. The parapet walls were of rubble masonry. In Ross-shire, the Grudie bridge power station of the Loch Fannich project also involved a new bridge to carry the main road from Garve to Gairloch. This bridge had one low arch in reinforced concrete and solid parapets in Taradale stone.

**Belgium.** A contract was placed in 1949 in Belgium for the world's first pre-stressed concrete bridge incorporating continuous spans, designed by Professor Gustave Magne. Spanning the Meuse river at Selayn, the bridge was to consist of two 206 ft. hollow girder spans continuous over a central pier. A lower bid, for a concrete bow-string arch, was rejected because it required three piers in the river.

Work was progressing on the reconstruction of the railway bridge at Val-Benoit. Designed to carry a double-track railway line, it had two approach spans of 82 ft. and a central structure of three continuous spans, each 178 ft. long. Construction also continued during the year on a road bridge of steel across the river Sambre at Marchienne-au-Pont.

**Brazil.** The Galéão bridge in the harbour of Rio de Janeiro, a 15 span pre-stressed concrete girder bridge 1,215 ft. long, was opened to traffic in 1949 with only three of the final six highway lanes completed.

**Canada.** In Vancouver, British Columbia, an $8 million, eight-lane bridge, 90 ft. wide, with 90 ft. clearance over the water, was planned in 1949 to replace the Granville street bridge. The latter, a low-level structure with swing span, caused traffic congestion when the bridge was opened in rush hours.

Construction of a $13,500,000 low-level bridge, 3,000 ft. long, over the Strait of Canso, which separates Cape Breton Island from the mainland of Nova Scotia, was authorized in 1949 by the Canadian government. Difficult foundation problems were presented by strong tidal currents and the 200 ft. depth of water.

**France.** A new steel road bridge over the river Marne was completed at the end of Dec. 1948. The bridge was of the bow-string type, with a span of 259 ft. and a clear width of 246 ft. The super-structure carried a roadway of 20 ft.

**Germany.** The reinforced concrete arch bridge carrying the important Mittelland canal across the Weser valley near the town of Minden, destroyed by the retreating German army in 1945, was rebuilt in 1947-49 at a cost of $2 million.

The reconstructed Autobahn bridge across the Lahn valley at Limburg, on the Frankfurth-Ruhr route, had spans of 207, 311 and 207 ft. German military K-type truss were used as the bridge was cantilevered across the river.

**Greece.** The Brallo bridge, steel deck-truss type, on the Athens-Salonika line of the Greek State railroad, was completed in 1949 as one of the reconstruction projects carried out by the American Mission for Aid to Greece.

**Hungary.** All of the bridges over the Danube at Budapest (five highway and two railway) were wrecked during World War II; six were blown up by the German troops and one (the uncompleted Arpád bridge) was damaged by artillery. Until 1946, when the Franz Joseph suspension bridge was reconstructed, the city was served only by a pontoon bridge, which replaced the famous Elizabth suspension bridge, and by a temporary trestle bridge, which replaced the Margaret bridge. Plans were made to rebuild the famous Clark chain suspension bridge in 1949 and the Miklós Horthy bridge (now re-named the Boraros bridge) in 1950. In the meantime, as steel became available, the continuous steel girder Arpád bridge, with a longest span of 340 ft., was completed in 1949. The deck area of this bridge was 90 ft. wide and 3,000 ft. long.

**India.** Construction was begun in 1949 on a new bridge across the Mahanandi river, near Sambalpur. The bridge, estimated to cost $3 million, would form an important link on the national highway between Bombay and Calcutta.

The foundation stone was laid of a new road bridge across the Godavari, near Rajahmundry. The bridge, which was estimated to cost Rs.20 million would have a roadway 24 ft. wide. It would form an important link in the system of national highways from Madras to Calcutta.
Japan. A 1,600 ft. reinforced concrete bridge over the Tama river, on the modern highway from Tokyo to Yokohama, was completed in 1949. It was under construction for two years at a cost of 130,000,000 yen ($400,000 U.S.).

Northern Rhodesia. On Sept. 8, the Kafue bridge was opened by the governor, Sir Gilbert Rennie. The bridge was 420 ft. long and spanned the river Kafue (a tributary of the Zambesi) about 30 mi. south of Lusaka. The Beit trustees had prepared plans for a bridge in 1939 but World War II prevented its construction. After World War II the Beit trustees purchased from the London County council one of the temporary bridges which had been erected over the Thames at London. This was dismantled and taken to Rhodesia and handed over to the Northern Rhodesian government. The new bridge was the first permanent road bridge crossing the lower reaches of the Kafue.

Nyasaland. A new bridge at Chiromo, to replace the one destroyed by heavy floods in March 1948, neared completion at the end of the year. The Cleveland Bridge and Engineering company, of Darlington, started work on the bridge in 1948 and it was planned for trains to pass over the bridge by Jan. 1950 and for the bridge to be completed by June 1950.

United States. Progress was recorded in 1949 in securing official authorization for the proposed Liberty bridge to span the Narrows at the entrance to New York harbour between Brooklyn and Staten Island with the unprecedented span length of 4,620 ft. and an underclearance height of 237 ft., at an estimated cost of $78 million. Public hearing on the application of the Triborough Bridge authority of New York city was held on Jan. 12 before a board of top-ranking officers of the U.S. army, navy and air force; and official war department approval of the plans was signed by the U.S. secretary of defence on May 24.

Official approval by the governor and the state superintendent of public works in 1949 paved the way for the construction of a new suspension bridge of 1,700 ft. main span to be built by the New York State Bridge authority across the Hudson river between Kingston and Rhinecliff, estimated to cost $14 million.

Construction progressed through 1949 on the new $13 million Tacoma Narrows bridge, a four-lane suspension bridge replacing the two-lane structure completed on July 1, 1940, which was destroyed by aerodynamic oscillations on Nov. 7, 1940. The bridge utilized the original piers, with a main span of 2,800 ft., the third longest in the world. Misfortune continued to attend this undertaking. On April 13, 1949, an earthquake hurled a 23 ton saddle casting from the top of one of the completed towers to the bottom of Puget sound, sinking a work barge en route; and on June 8 a fire at the base of the west tower buckled one of the steel plates and damage was estimated at $300,000.

Work was continued during 1949 on the substructure for the Delaware Memorial bridge (suspension type) over the Delaware river near Wilmington, Delaware, to connect Delaware’s du Pont highway with New Jersey’s planned new turnpike. With a main span of 2,150 ft., the estimated cost was $40 million. The project was 34 mi. long.

The California Toll bridge authority approved in 1949 plans for a new bridge over San Francisco bay to parallel the existing Transbay bridge about 300 ft. north of that structure.

Contracts were let by the Maryland State Road commission in 1949 for the construction of the Chesapeake Bay bridge. The 1948 estimate of $36,370,000 for the structure was increased to $47 million. The crossing included a suspension bridge of 1,600 ft. main span and a cantilever bridge of 780 ft. main span.

A significant event in 1949 was the casting and testing of the first precast concrete girder in the United States. This 160 ft. girder was for Philadelphia’s new $700,000 Walnut Lane bridge, the first application in America of this new type of bridge construction. The available 400 tons of steel ingots, added to the 150 ton dead weight of the girder, proved insufficient to produce failure. The reinforcing wires, prestressed to 125,000 lb. per sq. in. had an ultimate strength of 242,000 lb. per sq. in. and a yield strength of 213,000 lb. per sq. in. (compared with 160,000 lb. per sq. in. specified), and the concrete had a 28-day strength of 7,200 lb. per sq. in. (compared with 5,400 lb. per sq. in. specified). The bridge,
The A'dour bridge across the Tummel, near Pitlochry, Perthshire. Built for the North of Scotland Hydro-Electric board in a style similar to Waterloo bridge, London, it was handed over to the Perthshire county council in Oct. 1949.

scheduled for completion early in 1950 would have 13 prestressed concrete girders 160 ft. long in the main span and 7 girders 74 ft. long in each side span.

The Lake Washington Floating bridge at Seattle, Washington, completed in 1940 at a cost of $9,860,000, was made toll-free after nine years of collections. The removal of tolls increased traffic to a point where construction of a second bridge across the lake was being considered.

A new $4 million high-level bridge over the Chesapeake and Delaware canal at Chesapeake City, Maryland, was completed in 1949 to replace a lift bridge which was destroyed in 1942 when a tanker crashed into the south pier. The new bridge was a steel tied-arch of 540 ft. span, identical in span and design with the bridge at St. Georges, Delaware, built in 1942 over the same canal following a similar accident in 1939.

Construction also progressed on the high-level Penrose Avenue bridge, crossing the Schuykill river between Philadelphia and Chester, Pennsylvania. The project was 12,378 ft. long, including approach viaduct spans on high concrete piers and a cantilever bridge of 680 ft. main span.

The famous Pecos viaduct of the Southern Pacific railroad near Comstock, Texas, for many years the highest railroad bridge in the United States, was dismantled in 1949 after replacement by a new cantilever bridge in 1944.

The high-level bridge, connecting Akron and Cuyahoga Falls, Ohio, arching 185 ft. above the Cuyahoga river, completed in 1949, was a decktype cantilever bridge, 900 ft. long, with a centre span of 480 ft.

At East Fredericktown, Pennsylvania, a suspension bridge of 1,000 ft. span was built over the Monongahela river in 1949 to carry a belt conveyor for bringing coal across the river from mine to processing plant.

In South Carolina, a three-span steel highway bridge (put out of service when the Santee dam was completed in 1941) was moved 20 mi. downstream in 1949, from Lake Marion on the Santee river to a new crossing over the Santee-Cooper diversion channel. The three truss spans (150, 168, 150 ft.) were lifted from their original piers, towed downstream on a wooden barge and placed on newly constructed piers at the new site.

During the cantilever erection of the new Bluestone river highway bridge near Hinton, West Virginia, a sudden collapse of 231 ft. of the 278 ft. centre span on March 31, 1949, plunged five men to their death in the stream 150 ft. below and four others were injured. The cause of the collapse was not discovered. (See also Roads.) (D. B. S.; X.)

BRITISH BORNEO. British territories in Borneo consist of the colonies of North Borneo including the island of Labuan (area, 29,540 sq. mi.; pop. [1947 est.] 335,379); Sarawak (area, c. 50,000 sq. mi.; pop. [1947 census], 546,361) and the protected state of Brunei (area, 2,226 sq. mi.; pop. [1947 census] 40,670). Governors: North Borneo, Sir Ralph Hone; Sarawak (also high commissioner for Brunei), Duncan G. Stewart (assassinated in December).

Proposals for the establishment of executive and legislative councils in North Borneo were approved and the necessary instruments to give them effect were in process of drafting and were expected to be ready before the end of the year. Under arbitration an award of £1 4 million was fixed as the sum to be paid by the British crown to the British North Borneo company in respect of the transfer to the crown of the company’s sovereign rights and assets in North Borneo under the terms of the agreement entered into in June 1946.

The governor, D. G. Stewart, was stabbed on Dec. 3, at Sibu, by a member of the Malay Youth association which opposed the cession of Sarawak to the crown. He died at Singapore on Dec. 10.

Finance and Trade. Currency: Straits dollar ($1 = 2r. 4d.)

BRITISH COUNCIL—BRITISH EAST AFRICA

BRITISH COUNCIL. At the end of 1949 the British Council had representatives in 40 foreign countries, in Australia, New Zealand, India and Pakistan and in 18 British colonies. During the year it opened offices in Fiji, Israel, Mauritius and Uganda. The Council supplied material and services to the United States, Canada, South Africa and other countries in which it was not represented. In the United Kingdom it provided services for people overseas through 34 offices and centres.

The total of the grants-in-aid voted by parliament for the council for the financial year 1949-50, after allowing for estimated receipts of £224,600, was £3,232,000, made up of £2,551,000 for work in foreign countries and £681,000 for work in the Commonwealth. The total establishment of staff provided for was 3,471, but the total staff actually employed was about 3,000.

On Jan. 1, 1950, the council took over from the Colonial Office responsibility for the welfare of British colonial students in the United Kingdom. The British government provided about £500,000 to finance this work and also an increase in welfare services for overseas students in London, for five years.

In 1949 there were in operation cultural conventions, all entered into by the British government after World War II, with France, Brazil, Belgium, the Netherlands, Norway and Czechoslovakia. The council, usually nominated by the British government as its principal agent in the matters under review, was represented on, and provided the secretariat for, the British sections of the mixed commissions set up. During the year five mixed commissions held meetings and the chairman of the council met the Brazilian commission when he made a tour of inspection of council establishments in Latin America. The council was also represented on the Cultural committee of the Brussels Treaty powers, which, during 1949, dealt with arrangements for promoting the free flow of cultural material and the free movement of persons between the five countries. The council and the British Treasury arranged a study course in connection with the Brussels treaty in Nov. 1949, when nine senior government officers from Belgium, France, Luxembourg and the Netherlands came to London to study the structure and organization of the British executive and the relations between the central government and the local authorities in Great Britain.

The annual report of the council for the year to March 31, 1949 recorded that in 73 overseas centres maintained or assisted by the council 44,801 students attended English and other courses, and 26,012 members enrolled for extracurricular activities. In 22 countries 1,600 teachers of English attended summer schools arranged in cooperation with local educational organizations or universities. The overseas libraries had over 215,000 books and sales of the council's brochures totalled 140,664. The council awarded 242 postgraduate scholarships tenable in the United Kingdom to students from foreign and Commonwealth countries, 119 extensions to scholarships previously awarded and 105 short-term bursaries to technicians and industrial and other workers. Through the council 12 countries offered 62 scholarships to British students. The council arranged study programmes for 869 professional visitors to the United Kingdom, and, in cooperation with British universities and other bodies, short courses and summer schools for 1,700 other visitors from 57 countries.

BRITISH EAST AFRICA. The term is used to cover Kenya (colony and protectorate; area, 224,960 sq. mi.); Uganda (protectorate; area, 93,981 sq. mi.); Tanganyika (under United Kingdom trusteeship; area, 362,682 sq. mi.); Zanzibar (protectorate; area, 1,020 sq. mi.); and the Somaliland (protectorate; area, c. 68,000 sq. mi.; pop. [1947 est.] c. 700,000). Populations (Feb. 25, 1948 census):

* Provisional figures

In 1948 the East African High commission, consisting of the officers for the time being administering the governments of Kenya, Uganda and Tanganyika, with a central assembly (consisting of official and unofficial members with an unofficial majority) and an executive organization was established to co-ordinate and control the technical services of the three territories. Governors: Kenya, Sir Philip Mitchell; Uganda, Sir John Hathorn Hall; Tanganyika, Sir Edward Twining; Somaliland, Gerald Reece; Zanzibar, British resident, Sir Vincent Glenday.

History. Constitutitionally there were no changes in 1949 but it was a year of great development in the sphere of local government. Kampala was raised to municipal status with a municipal council exercising considerable local autonomy, consisting of European, Asian and African members and presided over by a non-official (Asian) chairman. In Dar es Salaam a new municipal council was established with equal numbers of non-official European, African and Indian members. The raising by Nairobi of a £1 5 million loan on the open market on its own assets and responsibility opened a new stage in the development of colonial municipalities. In Uganda the African Local Government ordinance of January gave constitutional support to developments of recent years. In Kenya the text of a bill to provide for local government in Native areas and re-establishment of district councils was submitted to the country for criticism and later was laid before the Legislative Council. In Tanganyika the first provincial council (comprised of officials and unofficial members of the European, Asiatic and African communities) was formed in the Lake province and held its first meeting in June.

Considerable progress was made towards easing the transport bottleneck. Some 350 mi. of railway were under construction in Tanganyika; in Kenya re-alignment between Nairobi and Nakuru reduced the distance and produced an easier gradient. At a conference in London in January on East African transport problems, attended by East African governors and by representatives of both the British government departments concerned and of the East African railways, congestion at Dar es Salaam was the main subject of discussion; immediate steps decided on were the extension of the present quay by 500 ft., a large increase in the lighter fleet, an addition of three cranes and a steady increase in railway rolling stock. A technical committee of the East African railways reported later in the year that it estimated Dar es Salaam could be developed into a major port with 18 deep-water berths and that with certain limited improvements, either in hand or suggested, it should by 1951-52 be able to handle nearly twice the total tonnage of 1948. It was announced that to carry out these and other improvements the East African Railways and Harbours administration were preparing to borrow £23 million in instalments.

In May agreement with the Egyptian government was announced with regard to the building of a dam and hydroelectric power station at Owen falls, Uganda. The Egyptian government offered to pay £4·5 million towards the cost of the scheme (estimated to cost a total of £12 million). The contract for the construction of the dam was placed with an Anglo-Dutch firm and the work was expected to be completed
The Commonwealth prime ministers at Buckingham palace on April 23, 1949. Left to right, D. S. Senanayake (Ceylon), L. H. Pearson representing Louis St. Laurent, Canada), Liaquat Ali Khan (Pakistan), H.M. the King, C. R. Aitlee, J. B. Chifley (Australia), D. F. Malan (South Africa), Peter Fraser (New Zealand) and Pandit Nehru (India).

in four years. Meanwhile work forged ahead on certain preliminary installations—the construction of a temporary electrical power plant (diesel-driven), railway sidings and camps for the labour force.

The United Nation’s Trusteeship committee mission, which visited Tanganyika in 1948, made a number of criticisms of the administration to which the British government published a vigorous reply.

The much vaunted groundnuts scheme in Tanganyika produced more controversy than oil. A very frank report—Overseas Food Corporation: Report and Accounts for 1948-49 (H.C.252)—showed that the original plan had been badly over-optimistic both as to costs and possible rate of progress. Not the least disturbing feature of the report was the comment of the auditors. Nevertheless the scheme moved forward and brought with it many indirect benefits to the territory as a whole.

Fairly general rioting broke out in Uganda on April 25 and lasted 2-3 days with sporadic incidents occurring until May 4. The riots followed on an expression by the Kaboka of his inability to agree to certain demands put forward by a delegation representing the so-called Bataka party and the African Farmer’s union. Five Africans were reported to have been shot and more than 1,300 people were arrested; numerous cases of arson, looting and theft of vehicles occurred. The governor brought into operation the Emergency Powers Order-in-Council 1939, and called in military assistance from Kenya. On May 4 he announced the appointment of a commissioner to inquire into and report upon the origin, cause, purposes and development of the disturbances and the steps taken to deal with them and to make recommendations.

Principal exports: Kenya—sirai, coffee, radium carbonate, hides and skins, tea; Somaliland—hides and skins; Tanganyika—sirai (8,930,461 in 1948), cotton, diamonds, coffee; Uganda raw cotton (£7,457,674 in 1948), coffee, cigarettes, sugar; Zanzibar—cloves (£1,000,404 in 1948), coconut oil.

Finance and Trade. Currency throughout British East Africa is controlled by the East African Currency board in London; the standard coin is the shilling, divided into 100 cents; circulation (Dec. 31, 1948): notes £16,857,840, coinage £8,655,646.

BRITISH EMPIRE. Under this heading are grouped two articles and a table. The articles deal with changes within the Commonwealth of Nations—previously called British Commonwealth of Nations—and the colonial empire. The table gives essential data on the United Kingdom, the dominions, the colonies, the protectorates and trust territories as at Dec. 31, 1949.

Dominions. The early months of 1949 marked the climax of a momentous phase in the political and constitutional evolution of the Commonwealth of Nations. On March 31 Newfoundland, a former self-governing dominion, became, at the wish of its own people, the tenth province of the Canadian confederation; on April 18 Eire formally declared herself to be a republic and seceded from the Commonwealth; and on April 27 the prime ministers of the dominions assembled in London resolved that India upon becoming a republic could remain a full and equal member of the Commonwealth.

The union of Newfoundland with Canada and Eire’s departure from the Commonwealth had been decided upon in 1948 but both required legislation by the United Kingdom parliament in the final stages. In respect of Eire, or the republic of Ireland as it was correctly styled after April 18, this legislation was not without a broad significance for Commonwealth relations. The Ireland act, introduced by the prime minister in the House of Commons on May 3 and enacted on June 2, recognized that as from April 18 the republic of Ireland had ceased “to be part of His Majesty’s dominions” and as a result it gave statutory authority to assurances, already given by the prime minister, that “in no

</table>
event will Northern Ireland or any part thereof cease to be part of His Majesty's dominions and of the United Kingdom without the consent of the parliament of Northern Ireland." The act also provided that, although the republic was not part of His Majesty's dominions, it was not to be regarded as a foreign country nor were its citizens to be aliens for the purposes of any law in force in the United Kingdom or its colonial territories. The non-foreign status of the republic and its citizens in the United Kingdom was extended on a reciprocal basis by the separate legislation of other Commonwealth countries. The guarantee to Northern Ireland, embodied in the act, provoked a storm of criticism in Dublin.

India's already proclaimed intention of adopting a republican constitution meant that the form of her existing association with the Commonwealth would have to be changed. "In no way in our external, internal, political or economic policy," Pandit Nehru told the Constituent Assembly on March 8, "do we propose to adopt anything which involves the slightest degree of dependence on any other authority." But in terms of independent nations co-operating together as equals, free from binding commitments, India was prepared to consider future and friendly association with the Commonwealth. Internally and externally her government was much concerned with the advance of Communism in Asia. The attitude of the Communist party in India was described by its prime minister on Feb. 28 as one of open hostility "bordering on open revolt" and it was felt by many that in such circumstances a policy of isolation entailed many risks.

The problem before the dominion prime ministers, who assembled in London on April 21, was whether India's desire to remain a member of the Commonwealth could be reconciled with her resolve to become a republic. The historic communiqué issued on April 27 announced that a satisfactory solution had been found during talks which had been conducted throughout in an atmosphere of goodwill and mutual understanding. India, about to become a sovereign independent republic, declared her desire "to continue her full membership of the Commonwealth and her acceptance of the King as the symbol of the free association of its independent member nations and as such head of the Commonwealth," while the other countries of the Commonwealth, the basis of whose membership was specifically declared not to be thereby changed, recognized India's continuing membership on this basis. All, therefore, remained united as free and equal members of the Commonwealth of Nations, "freely co-operating in the pursuit of peace, liberty and progress."

The resolution of India's constitutional problems was warmly welcomed by all parties in the United Kingdom and in most parts of the Commonwealth. After a two-day debate the London declaration was ratified by the Constituent Assembly in New Delhi with only one dissentient vote. Pandit Nehru, in an address to both houses of the Canadian parliament on Oct. 24 during his official visit to North America, spoke of it as "an outstanding example of the peaceful solution of difficult problems" to which the rest of the world might well pay heed. The reaction in Pakistan was, however, reserved. On April 28 its prime minister, Liaquat Ali Khan, underlined the fact that his country had not yet drafted its constitution nor decided whether it should remain freely associated with the Commonwealth as a monarchy or a republic; or whether it should secede. Continuing tension with India on the Kashmir dispute made it clear that although a most difficult constitutional question had been resolved unity of outlook on the Indian subcontinent had by no means been achieved.

Dr. Daniel F. Malan, the Nationalist prime minister of South Africa, who attended the London conference, described it on May 11 as a milestone in the history of the Commonwealth. It had promoted unity and South Africa, even though she might decide to become a republic, was united in her desire to remain in the Commonwealth. The South African government took the view that after the prime ministers' meeting it was no longer constitutionally possible to talk of common status for citizens of Commonwealth countries and the South African Citizenship act, promulgated on Sept. 2, gave this view legal expression. The act provoked much controversy in the Union and some criticism outside, mainly because it extended for British subjects the qualifying period for South African citizenship from two years to five and then required specific application to be made. To a greater extent the racial policies of the Union government continued to arouse critical comment in other parts of the Commonwealth, especially in the Asian dominions. In November Dr. Malan announced that he proposed to ask the United Kingdom to transfer responsibility for the administration of Basutoland, Bechuanaaland and Swaziland to the Union.

During the year the Commonwealth governments cooperated closely in the economic field. From July 13-18 the first meeting ever held of Commonwealth finance ministers took place in London and reached complete agreement upon immediate measures to be recommended to governments for checking the continuing heavy drain upon the central reserves of gold and dollars. On Sept. 18 the United Kingdom chancellor of the exchequer announced the devaluation of
the pound sterling in relation to the United States dollar. Similar measures were announced shortly afterwards by the other governments of the Commonwealth with the one exception of Pakistan which decided against alteration in the exchange rate of the rupee.

In both west and east the countries of the Commonwealth were much concerned with the problem of security in 1949. In the west the North Atlantic treaty, signed at Washington on April 4, was of outstanding importance. Two Commonwealth countries, the United Kingdom and Canada, were signatories and elsewhere it was welcomed as reinforcing the defences of the peace-loving peoples of the world. The treaty, approved on March 28 by 149 votes to 2 in the Canadian House of Commons, marked a significant development in Canadian foreign policy for which its Liberal prime minister, Louis S. St. Laurent, whose party later in the year won a resounding electoral victory, was in no small measure responsible. In the eastern half of the Commonwealth, Communist victories in China underlined the need for adequate security measures there. New Zealand introduced compulsory military training in August and in November consultations were held in Canberra between representatives of the United Kingdom, Australian and New Zealand governments to discuss matters relating to the peace treaty with Japan and the situation in eastern Asia. (N. MGH.)

Colonies. It might be said that publicity was the foremost element in the British government’s colonial policy in 1949. The outstanding event was the Colonial Month in London inaugurated by the King on June 21. Principal feature of the month was an exhibition, “Focus on the Colonies,” which proved so popular that it was found necessary to keep it open till mid-September; it had been visited by over 500,000 people before it closed. The British Broadcasting corporation and many London organizations and business firms with colonial connections featured the colonies in an effort to make the imperial metropolis more conscious of its colonial responsibilities.

The Colonial Loans act, 1949, was enacted to enable the Treasury to guarantee certain loans by the International Bank for Reconstruction and Development to the governments of colonial territories up to a total of £50 million, subject to the purpose of the loan being approved by the secretary of state for the colonies, with the concurrence of the Treasury, as likely to promote the development of the resources of the colonial territory concerned. Under the terms of its charter the International Bank could guarantee or make loans only to members or political sub-divisions of members and, in the case of the latter, “the member or the central bank or some comparable agency which is acceptable to the bank” had to guarantee the loan. The Overseas Resources Development act, 1949, enacted later in the year, provided similar borrowing facilities for the Overseas Food corporation and the Colonial Development corporation.

The Colonial Development corporation published a report on the first year of its operation (to Dec. 31, 1948) showing the nature of the organization it had established and the extent and nature of its initial undertakings. These last proved to be nine in number, ranging from gold dredging in British Guiana to the production of manila hemp in British Borneo; and a further 57 projects were shown to be under active consideration, several of which were announced during the year as having been adopted.

The report on progress under the Colonial Development and Welfare acts for the year ended March 31, 1949, listed a total of 257 development and welfare schemes and 123 research schemes, costing £10,627,509 and £1,652,169 respectively, which had been approved in the previous 12 months, bringing the total sum now approved under the 1940 and 1945 acts as the United Kingdom’s contribution to colonial progress to £63,171,374. The amount actually issued in these 12 months was £6,354,084. It had, however, been realized that shortages of materials and manpower in the immediate postwar years had slowed down the implementation of the schemes; in order, therefore, to ensure the smooth operation of the plans now that supplies of men and materials were easier, the Colonial Development and Welfare act, 1949, was enacted to raise the total that might be spent in any one year from £17·5 million to £20 million, and to increase the maximum sum that might be spent on research in the same period from £1·5 million to £2·5 million.

Changes made in the constitution and purposes of the Imperial institute (founded in 1887 as a memorial of Queen Victoria’s golden jubilee) resulted in its administration being transferred from the Board of Trade to the Colonial Office and the Ministry of Education. The Colonial Office accepted responsibility for its scientific and technical activities, which will in future be undertaken by a Colonial Plant and Animals Advisory bureau and by the Mineral Resources section of the Colonial survey. Later the secretary of state appointed an Advisory Committee on Colonial Geology and Mineral Resources to advise him on matters relating to the geological survey of the colonial empire.

In June a conference of supplies officers from the colonies was held in London to discuss, first, the need for

Ayo Shonewan from Lagos, Nigeria, handing a bouquet to the Queen at the opening of Colonial Month in July 1949. On the King’s right is Arthur Creech Jones, Colonial secretary.
colonies to have access to the supplies required for their
general economic stability and welfare and for the execution
of their development programmes and, secondly, the need to
ensure not only that those supplies were obtained with as
little expenditure of hard currency as possible but that they
should make the maximum contribution towards the solution
of the sterling area’s dollar problem.

The British government expressed keen interest in the call
of the president of the United States to congress on Jan. 20
for a bold new programme for making American technolo-
gical resources available for the development of under-
developed areas. Ways and means of giving effect to that
programme—known as President Truman’s “fourth point”—
had still to be worked out, but meanwhile use was made of
the Economic Corporation administration’s technical assis-
tance programme by the despatch of two groups of American
scientists to conduct medical and agricultural surveys of
British colonial Africa and by American co-operation in a
preliminary survey in connection with the possible con-
struction of a railway link between Northern Rhodesia and
East Africa.

There was further evidence during the year of a desire for
colony’s ten-year development plan, which called for an expenditure
of $26 million. Remarkable progress was announced in a
campaign to rid the colony of malaria and it was claimed that
95% of the population was now free of its ravages. In July
two United States experts arrived to study rice production
methods and to advise the local government on its proposed
programme for large scale expansion of the industry. Food
subsidies were abolished in the spring when the only two
remaining subsidies—on flour and salted fish—which had
cost nearly $2 million in 1948, were withdrawn: but following
devaluation in September it was found necessary to reintro-
duce certain subsidies. The second goodwill meeting of the
governors of the British, French and Dutch Guianas was held
in Georgetown in February. U.S.A.A.F. handed over
Atkinson Field Air base (one of its wartime Caribbean bases)
to the local government, which agreed to purchase 300
buildings and a large quantity of equipment for approxi-
mately $1 million; certain buildings remained U.S. property,
but on loan to the local government. The governor announced
that the secretary of state had promised to appoint a com-
mission on constitutional reform in 1950.

Finance and Trade. Currency: West Indian dollar ($4.80=£1).
Budget (1948 provisional figures): revenue $20,601,599; expenditure
$19,616,692. Foreign trade (1948): imports $48,181,000; exports
$36,993,859. Principal exports: sugar, bauxite, rum, rice, diamonds
and timber.

BRITISH GUIANA. British colony on the northeast
coast of the continent of South America. Area: 89,480 sq. mi.

History. The Legislative Council approved the colony’s
ten-year development plan, which called for an expenditure
of $26 million. Remarkable progress was announced in a
campaign to rid the colony of malaria and it was claimed that
95% of the population was now free of its ravages. In July
two United States experts arrived to study rice production
methods and to advise the local government on its proposed
programme for large scale expansion of the industry. Food
subsidies were abolished in the spring when the only two
remaining subsidies—on flour and salted fish—which had
cost nearly $2 million in 1948, were withdrawn: but following
devaluation in September it was found necessary to reintro-
duce certain subsidies. The second goodwill meeting of the
governors of the British, French and Dutch Guianas was held
in Georgetown in February. U.S.A.A.F. handed over
Atkinson Field Air base (one of its wartime Caribbean bases)
to the local government, which agreed to purchase 300
buildings and a large quantity of equipment for approxi-
mately $1 million; certain buildings remained U.S. property,
but on loan to the local government. The governor announced
that the secretary of state had promised to appoint a com-
mission on constitutional reform in 1950.

Finance and Trade. Currency: West Indian dollar ($4.80=£1).
Budget (1948 provisional figures): revenue $20,601,599; expenditure
$19,616,692. Foreign trade (1948): imports $48,181,000; exports
$36,993,859. Principal exports: sugar, bauxite, rum, rice, diamonds
and timber.

BRITISH HONDURAS. British colony in central
Governor, R. H. Garvey.

History. The claims of Guatemala to the territory continued
to give rise to some uncertainty as to its future status; a
resolution in the Legislative Council stressed the people’s
loyalty to the British connection but at the same time urged
upon the British government the imperative necessity to
take all proper steps to bring about the speedy determination
of the claim made by the government of Guatemala. In a
reply to this resolution the British government stated inter
alia that, while remaining willing to submit the legal claim
to the International Court of Justice for adjudication, “ it
remained inflexibly determined that, in the absence of a legal
decision by the International Court that His Majesty has no
legal claim to sovereignty over British Honduras, it will
not countenance any change in the international status of
the colony or any part of it.”

The Hawkesworth bridge, a new suspension bridge 480 ft.
long with a centre span of 280 ft., over the Lower Belize
river was opened, thus completing the all-weather road from
the capital to the Guatemalan frontier. In general, the
achievements in the development programme were over-
shadowed by widespread unemployment due to the collapse of the mahogany and chicle industries.

**BRITISH LEGION:** see **EX-SERVICEMEN'S ORGANIZATIONS.**

**BRITISH PACIFIC ISLANDS:** see **PACIFIC ISLANDS,** British.

**BRITISH SOUTH AFRICAN PROTECTORATES.** Under this heading are grouped the three British protectorates of Basutoland, Bechuanaland and Swaziland, of which certain essential statistics are given in the table. High Commissioner, Sir Evelyn Baring.

**History.** The year reviewed was one of continued, progress with schemes financed under the Colonial Development and Welfare acts and, in Swaziland, of growing political activity of the Native authority. The economic future of Swaziland was also brightened by the announcement of an 100,000 ac. afforestation scheme to be started by the Colonial Development corporation.

The territories attracted interest during 1949 owing to the incidence of ritual murder in Basutoland, a crime of which 121 Basutos have been convicted during the past seven years, and the marriage between Seretse Khama, heir to the chieftainship of the Bamangwato tribe in Bechuanaland with an English woman named Ruth Williams. This latter question, which was the subject of a special government enquiry, had repercussions in the Union of South Africa where, it was announced, the chief designate and his white wife had been declared "prohibited immigrants."

In October, Dr. D. F. Malan, the Union prime minister, said in a speech at Bloemfontein that he was only waiting for the appropriate moment to make representations to the British government for the incorporation of the protectorates into the Union of South Africa.

**Basutoland.** Progress in the political sphere was marked by the increase to 24 of the number of the elected representatives in the Basutoland council. An endeavour was made to encourage an agricultural co-operative movement by the appointment of an official as registrar of co-operative societies. This step was expected to help a territory largely dependent upon pastoral and agricultural resources.

Education was remarkably popular with the Basuto and 75% of children attended school. Expenditure on education was about one-fifth of revenue. Construction was started on the six district hospitals. The number of patients attending all hospitals was double that of ten years ago. Welfare societies, with community halls, were formed in each district. During 1949 the first of these, with a library, was opened.

**Bechuanaland.** Schemes for surface water conservation were approved. These aimed at constructing small stock dams and minor permanent works in existing waterways. Boring for water was also continued. A teacher training institute was planned to improve the standard of education in the villages. A secondary school, initiated by the Bamangwato tribe, under Chief Tsekedi, was opened in its reserve.

**Swaziland.** Under a Native land settlement scheme valuable work was done, not only in settling landless families, but also in proper methods of land utilization and animal husbandry. Over 500 families were settled during 1947-49 and settlement for another thousand was planned. By voluntary contribution the Swazi nation raised funds to purchase 73,900 ac. from European owners.

A company, named Peak Timbers, Ltd., began commercial afforestation of an area of 57,000 ac. purchased by them in 1946 in the Pigg's Peak district. Production at the Havelock asbestos mine reached 218,608 tons for the year ending March 1948. The campaign against Ngana (animal trypansomiasis) met with considerable success through the help of bulldozers for bush clearing and through aerial spraying.

(W. R. G.)

**BRITISH WEST AFRICA.** The term includes the four British colonial territories on the west coast of Africa, viz., Nigeria, colony and protectorate with which are administered the Cameroons under United Kingdom trusteeship; the Gold Coast, including the colony of that name, Ashanti, the Northern Territories and Togoland under United Kingdom trusteeship; Sierra Leone, colony and protectorate; and Gambia, likewise a colony and protectorate. Areas and populations were as follows:

*Estimates.

Governors: Nigeria, Sir John Macpherson; Gold Coast, Sir Charles Arden-Clarke; Sierra Leone, Sir G. Beresford Stooke; Gambia, P. Wyn Harris.

**History.** Public interest in West Africa in 1949 centred almost exclusively in the discussion of constitutional changes. In Nigeria in March the Legislative Council unanimously approved the proposals of a select committee of its members (set up on a suggestion made by the governor the previous year) and including all the unofficial members) that the review of the present constitution should consist of conferences at three levels: the provincial, the regional and at the centre. Discussions began immediately and were continued throughout the year. Provincial conferences considered the views of village and divisional meetings and of representative organizations; the views formulated at provincial conferences were then, in turn, considered at regional conferences, at which level conferences for Lagos and the colony were included. The views of these regional conferences were incorporated in a series of resolutions, published in October, and were then submitted to a drafting committee to prepare a statement for consideration by a general conference consisting of all unofficial members of the Legislative Council and representatives of the regional, Lagos and colony conferences. Meanwhile in September the governor announced that, pending a decision on constitutional changes, it had been agreed that African representation on the Executive Council

should immediately be resumed and strengthened and he had accordingly appointed four Nigerians.

In the Gold Coast in January the governor set up an all-African committee of 39 members under the chairmanship of Mr. Justice J. H. Coussey to examine proposals for constitutional and political reform. Its report, unanimous on the majority of its principal recommendations, was published in October. After declaring that the whole institution of chieftaincy was so closely bound up with the life of the communities that its disappearance would spell disaster, the committee recommended: (1) a complex system of local government, in part utilizing the existing Native authorities but superimposing a democratic framework by means of popular elections; (2) the establishment of four regional councils with wide powers; (3) that the Executive Council should be entirely remodelled as the chief instrument of policy, responsible to the proposed House of Assembly and not to the governor, and should consist of the governor as chairman, not more than three official members, and upwards of eight unofficial members (one to be styled “leader” and the others “ministers”); and it expressed a slight preference for a bi-cameral legislature. In a statement published simultaneously with the report the British government both welcomed and accepted its recommendations in general; but it favoured a unicameral legislature and stated its inability at this stage to accept the suggestion, in the form proposed, that the Executive Council should be collectively responsible to the Legislative Assembly and not to the governor.

Meanwhile on opening the Gold Coast Legislative Council on Oct. 11 the governor announced that he had appointed E. C. Quist, an unofficial member, to be president for the remainder of the life of the council.

In Sierra Leone the constitutional changes approved in 1948 were not in fact proceeded with, a motion in the Legislative Council in Dec. 1948 having called for a further review of the proposals. In June the governor published new proposals recommending an Executive Council of four official and four unofficial members, the latter drawn from, and appointed by the governor after consultation with, the Legislative Council; the Executive Council to be responsible, as a body, for advising the governor on all major matters of policy and the four unofficial members each to take a special interest in a group of departments with a view to holding portfolios; the proposals also covered the development of local government, regarding which the governor stressed the need for a substantial measure of decentralization. It was suggested that a committee (presided over by an independent chairman and representative of the colony, the protectorate and the executive) should consider these new proposals.

The report of three United Nations scientists who visited the Gold Coast in Nov.-Dec. 1948 was published in January and confirmed that swollen shoot threatened the very existence of the cocoa industry of the Gold Coast and that the cutting out of diseased trees was the only measure known for its control (see Entomology). In February the publication of new regulations for immigration procedure into the Gold Coast raised an outcry in Great Britain; and following protests in the British parliament and the local Legislative Council, they were withdrawn and re-drafted.

It was announced in July that the Gold Coast government had placed a contract for certain improvements and extensions to Takoradi harbour at an expected cost of £2,250,000. Work continued on the construction of Freetown’s deep-water quay. A panel of experts arrived in the Gold Coast in October to survey the industrial and transport potentialities of the Volta river.

In Nigeria in August the unsatisfactory labour situation on the railways led to the appointment of a commission of enquiry, which was boycotted by the trade unions. In November a strike at the government colliery at Enugu gave rise to serious disturbances in which a number of Africans were killed. A commission of enquiry was again appointed, under the chairmanship of Sir William Fitzgerald, which began sitting in Enugu in mid-December.

Imports

(a) 1948. (b) 1948-49. (c) 1949-50 est. (d) 1949 est.

The values of cocoa recorded in the export statistics are the f.o.b. cost prices to the Gold Coast and Nigerian Cocoa Marketing boards and thus exclude the profits realized by the boards on sale to overseas purchasers. In 1948 these profits amounted in the Gold Coast alone to £20,013,017.

1) The value of the diamond exports (461,685 carats) was not quoted. Palm kernels and palm oil are quoted at f.o.b. cost prices.

Principal exports: Gambia: groundnuts (£1,628,002 in 1948); Gold Coast: cocoa, gold, manganese and timber; Nigeria: cocoa, groundnuts, palm oil and kernels, tin, and hides and skins; Sierra Leone: palm kernels, diamonds and iron ore.

BRITISH WEST INDIES. Under this heading are treated matters of common concern to the British West Indian colonies which comprise Barbados, British Guiana, British Honduras, Jamaica, Leeward Islands, Trinidad and Tobago and Windward Islands. Total area: 106,415 sq. mi. Total pop.: c. 2,970,600. (See also separate articles on the respective colonies.)

Steady progress was made during the year with work to give effect to the Montego Bay (Sept. 1947) recommendations on closer association. The Standing Closer Association committee under the chairmanship of Major General Sir Hubert Rance, having held its first session in Barbados in Nov. 1948, held further meetings in Trinidad in March, in Barbados in June and in Jamaica in Oct. 1949. The meetings were held in private; but it was disclosed that the committee had reviewed the functions of a federal government, the constitution of a federal legislature, the composition of a federal executive and the financial basis of federation including relations between a federal government and the unit governments and between these and the British government. It was understood that final proposals were agreed at the October meeting. Meanwhile commissions to examine the unification of the public services in the British Caribbean area and of a customs union for the West Indies commenced work.
BRITTEN—BROADCASTING

under the chairmanship of Sir Maurice Holmes and J. McLogan respectively.

The Earl of Listowel, minister of state for colonial affairs, carried out a comprehensive two-month tour of the British West Indies during October and November and presided over an unofficial conference of the governors at Barbados from Nov. 7—12.

Two sugar deputations, the first a four-man commission appointed by the British West Indies Sugar association and the second from Jamaica led by W. A. Bustamante, arrived in London in late summer to press for better terms for West Indian sugar. After talks the British government issued a statement saying that it recognized the vital importance of the prosperity of the sugar industry to the West Indies and promising to call a conference in the autumn with all Commonwealth sugar producers to agree terms; later it was announced the conference would begin on Nov. 21.

The University college of the West Indies was formally launched in January when it was announced that the King had granted a royal charter and that Princess Alice, Countess of Athlone, was appointed its first chancellor.

Other events of common concern to the British West Indies were talks held in Barbados in February between the United Kingdom, Canadian and West Indian governments for a preliminary and informal exchange of views on future shipping services: the third full meeting, also at Barbados, of the West Indian Oils and Fats conference, called primarily to fix the price of copra for the coming season; and the establishment of a Federation of Primary Producers of the British Caribbean and British Guiana. (J. A. Hu.)

BRITTEN, (EDWARD) BENJAMIN, British pianist, composer and conductor (b. Lowestoft, Nov. 22, 1913), was educated at Gresham's school, Holt, and at the Royal College of Music, London. He was with the post office film unit from 1935 to 1937, when he wrote music for such documentary films as Night Mail and Coal Face. At the same time he composed music for plays by W. H. Auden and Christopher Isherwood and by J. B. Priestley. In April 1939 he went to New York where he remained until 1942; many of his works were performed by American orchestras. In 1940 he collaborated with Auden in adapting his book Paul Bunyan for choral operetta. In Nov. 1941 he received the Elizabeth Sprague Coolidge award for "distinguished services to chamber music." His first full-length opera was Peter Grimes (1944), followed by The Rape of Lucretia (1946), Albert Herring (1947) and by a new version of The Beggar's Opera. Living at Aldeburgh, Suffolk, he helped to found the Aldeburgh Festival where in 1949 he presented a children's opera, Let's Make an Opera, with Eric Crozier. In 1947 he was appointed musical director of the English Opera group and in Sept. 1949 conducted three performances of the group in Oslo, Norway. His 44th composition, Spring Symphony, was performed at the music festival at Amsterdam in 1949 and was played for the first time in the United States by the Boston symphony orchestra at Tanglewood on Aug. 13, 1949. He wrote a wedding anthem Amo Ergo Sum for the wedding of the Earl of Harewood and Miss Marion Stein on Sept. 29, 1949.

BROADCASTING. Once again the international implications of the medium occupied the attention of radio organizations throughout 1949. In the first place, the working out of the medium wave allocations agreed upon at the Copenhagen conference in 1948 proved to be more onerous to those countries who readily accepted its decisions and controversial where its provisions led to results not fully seen by the negotiators on the spot. As late as December meetings were being held in Washington at which the fullness of the plan hung in the balance, and there was no guarantee that the deadline of March 1950 would, in fact, be observed. The even more complex subject of short waves was argued for months at Mexico City. Finally, in April 1949, 51 delegations accepted a plan, the first world plan of short wave distribution ever to be agreed, which was based on what is known as "summer intermediate sun activity." The adaptation of the plan, which was passed to a technical committee, although bound to decrease the number of frequency hour availabilities, by introducing proportionate reductions from country to country, would not involve the disappearance of programmes already in being. Unfortunately, both the U.S.A. and the U.S.S.R. were included in the 18 delegations which remained negative. Meanwhile in Europe steps were taken towards the formation of a European broadcasting organization which should be fully representative of the democratic powers. In 1949 two organizations existed, the Union Internationale de Radiodiffusion (U.I.R.) based in Switzerland and, during World War II, largely dominated by Germany; and the Organisation Internationale de Radiodiffusion (O.I.R.) based in Belgrade and largely dominated by east European countries. From both of these organizations the B.B.C., largest and most powerful of the European radio bodies, stood aside. At Stresa, Italy, in the summer some progress was made towards ending the deadlock, the B.B.C being represented in unofficial discussions with members of the U.I.R. At Brussels, Belgium, in the autumn, some significant resignations from O.I.R. took place. It was possible that 1950 would see "western union" accomplished in this field. Already, on the cultural side, there was good progress to record with the award of the first Itala prize, a competition for an original work for radio to which 12 countries contributed, including Czechoslovakia, Finland and Monaco. An international jury made the first award to France, for a musical farce entitled Frederick the General, the second to Great Britain for a radio reconstruction of The old and true story of Rumpelstiltskin and the third to Monaco for Lost Song, a radio film. The Itala prize was created a foundation, and would be given, in alternate years, for musical and literary works. Further evidence of international co-operation came from the northern European states. In June, Danish, Finnish, Icelandic, Norwegian and Swedish representatives met in Stockholm, Sweden, and decided to embark on an ambitious series of relays, involving concerts, Nordic art, drama and literary chronicles. Continuous exchange of technical data was also agreed upon. The Swedish programmes for the autumn showed that Radiotjänst at least had been practically and fully influenced in its planning by the decisions of this conference. Finally, on the international theme, it should be recorded that the number of services to foreign countries and audiences overseas increased considerably in 1949 (the majority of these being on short wave was likely to be affected by the Mexico City decisions). It was possible, too, to listen, for instance, to Danish broadcasts to South Africa, Polish broadcasts to Yugoslavia, Italian broadcasts to Somaliland and Rumania, Norwegian broadcasts to seamen all over the world and even Albanian broadcasts to Britain.

Great Britain. A considerable amount of time and energy was expended on activity which was the reverse of international. As a result of intensive Russian jamming of B.B.C. broadcasts, the B.B.C. in collaboration with stations in the U.S. zone of Germany, retaliated by bringing an unparalleled transmitter strength to bear on the U.S.S.R. More constructively, perhaps, the B.B.C. increased its listeners to English by Radio courses not only in western Europe but also in some east European states. Over 1,000 Bulgarian listeners, for instance, wrote to London for texts of a progressive course of lessons. From eastern Germany, too, came a heavy mail
as the result of a new programme intended to keep the populations in touch with the outside world. Outside Europe, a new B.B.C. service was inaugurated in the autumn to Israel, in Hebrew, the first of its kind in the world. Within the Commonwealth, separate transmissions were begun for India and Pakistan in place of the previous combined Hindustani service. Arrangements between the governments of the United Kingdom and Ceylon allowed for the use during eight-and-a-half hours every day of Radio Ceylon (formerly Radio S.E.A.C.) for transmitting B.B.C. programmes to the far east. Re-broadcasting on the other side of the world was not seriously affected by television, a record number of stations in the U.S.A. and Canada carrying B.B.C. material. At home, however, public interest in the spread of television to the midlands outshone other developments (see TELEVISION). However, an even vaster public than in previous years became addicted to radio drama (in the "blind" medium, as it was now popularly known), and there were few listeners who did not genuinely mourn the death of Tommy Handley (see OBITUARIES), the chief comedian of Itina, a programme whose absurdities had enlivened the public to an extent and after World War II. Various experiments were made in the talks and discussion programmes for home listeners, including the examination before the microphone, by a variety of witnesses, of such public figures as Sir Stafford Cripps, and the presentation before a studio audience of lectures previously delivered by a regius professor within the precincts of Cambridge. During the year, the studios in Edinburgh, Plymouth and Belfast celebrated their silver jubilee. A government committee under Lord Beveridge began its enquiries into the future of British broadcasting and television.

Europe. German developments were the most spectacular. In the American and British zones it was decided that the only satisfactory coverage, after the Copenhagen plan came into operation, would be by frequency-modulation transmission on ultra-short waves. The industry was accordingly requested to produce receivers. If the plan went through, which seemed probable, Germany would be the first European country to introduce ultra-short wave broadcasting on a large scale. In the meantime, the Bavarian radio, with American permission, became commercial; and in Berlin the U.S.-controlled R.I.A.S. instituted a system unique in Europe, whereby telephone subscribers by dialling a certain number were connected to a non-stop news service, recorded on magnetic tape, and changed three times daily. The Italian and Austrian broadcasting organizations celebrated their 25th anniversaries; whereas the latter signalized the occasion by arranging for better concerts (including those of the Vienna Philharmonic orchestra), than had ever hitherto been heard, the former, eager to attract more listeners, and especially those who paid licence fees, arranged lotteries, prize-winning tickets from which the numbers of licences already issued. Cars, bicycles, pleasure hours and watches were among the prizes, and the number of paid-up listeners was higher than ever before in the quarter century of R.A.I. On the other side of the "iron curtain," more and more attention was paid to education, which, whether for the young or for adults, was made the vehicle of much party propaganda. In Poland, however, and to a certain extent in Czechoslovakia, this increasing use of the radio for political propaganda did not prevent the emergence of programmes of good music. The French radio gave some time to the project of a radio university, while in Switzerland the chief developments were in discussions with listeners taking part and in plays specially written or adapted for the medium.

Commonwealth. As in Great Britain, broadcasting in Australia and Canada came under enquiry during the year.

Mrs. Lesley Piddingtion, who with her husband, Sydney, gave a series of broadcasts in 1949 in which they demonstrated thought transference. She is seen here in the Tower of London while her husband was in a B.B.C. studio.

A new control board in Australia, while approving the basic system, in which public service and commercial broadcasting services existed side by side, declared that many improvements were necessary to supply listeners with an adequate broadcasting service. The board intended to enforce standards governing the quality of programmes and advertising if necessary, and to reduce the amount of the latter. In Canada a Royal Commission on Arts, Letters and Sciences was still sitting at the end of the year. To it both private broadcasters and the Canadian Broadcasting commission had submitted evidence, the former asking for equal rights with the C.B.C., the latter declaring that judgment in broadcasting matters should be based solely on public interest and calling for a fully national radio system, owned and supported by the public. South Africa's earlier declared intention to pursue commercial broadcasting as a new policy was now understood to involve no separate organization. The S.A.B.C. would remain in charge of three programmes, of which the third would be commercial. India announced an eight-year plan for extending radio throughout India, serving ten times the former area and reaching 80,000 villages instead of the then 5,000. The government were to provide receiving sets and loudspeakers. In the colonies, interest in broadcasting was growing apace. It was understood that certain funds might shortly be made available for erecting new stations, especially in British West Africa and the West Indies. The B.B.C. was called into consultation by the Colonial Office and undertook service surveys for the government at home. The public service system, of which the B.B.C. was the outstanding example, was likely to be adopted in these areas, and the B.B.C. was expected to be called upon to play a large part in all colonial broadcasting plans.

United States. According to figures compiled by O. H. Caldwell, editor of Tele-Tech magazine, the number of radio receiving sets in use in the U.S. in 1949 was 81 million compared with 74 million in 1948.
A Federal Communication commission report, issued in Dec. 1949, reflecting 1948 conditions, showed A.M. (amplitude modulation) broadcast revenues of $406,995,414; broadcast expenses of $342,903,730, and broadcast income of $64,091,684 before payment of federal income taxes. Despite an 11-9% gain in revenues net income fell 10-73% below the 1947 level, owing to a 17-5% rise in operating costs. The figures were based on reports from seven A.M. networks and 1,797 other A.M. stations.

Sales of advertising time, the financial backbone of broadcasting, totalled $416,720,279 during 1948.

In August, the Federal Communications commission made final its proposal to ban, from Oct. 1, programmes which offered prizes of money, merchandise and services, by classifying them as lotteries. At the time, the four major networks were carrying 38 "give-away" programmes which, according to the estimates by Broadcasting magazine, offered $185,000 worth of money and merchandise in prizes each week. Before the effective date, the F.C.C. suspended its rules pending court tests of their legality. By the end of the year, however, "give-away" programmes were already beginning to decline in popularity. "Mystery " features began to replace variety shows as the dominant type of commercial evening programme.

The table below, prepared from information by C. E. Hooper, Inc., shows the general composition of commercial evening programmes broadcast on the four national networks during the week of Nov. 1-7, 1949, compared with the same week of 1948.

The inauguration of President Harry S. Truman for a second term and Alben W. Barkley as vice-president was taken by radio and television to more viewers and listeners than ever before. In addition to domestic coverage, the State Department's "Voice of America," the B.B.C. and Radiodiffusion Française relayed shortwave accounts overseas. Vice president Barkley's marriage to Mrs. Carleton S. Hadley on Nov. 18 was also widely followed by listeners.

In April 1949, the board of directors of the National Association of Broadcasters approved a $75,000 loan to the Broadcast Measurement bureau, an audience measurement organization sponsored by the N.A.B., the American Association of Advertising Agencies and the Association of National Advertisers. The loan was to finance the completion of the bureau's second national audience survey, in progress in 1949.

The Federal Communications commission handed down several policy-making decisions in 1949, one of which reversed the long-standing "Mayflower decision" forbidding radio station owners to "editorialize" on the air. Henceforth, the F.C.C. said in a new decision issued on June 2, broadcasters might air their own views on controversial and other issues, provided they treated with "fairness" those who wished to present opposing viewpoints.

In congress, the senate passed a bill introduced by Senator E. W. McFarland (Democrat, Arizona) to reorganize the F.C.C.'s staff and procedures. The house of representatives failed to act, but leaders said it might do so in 1950.

The North American Regional Broadcasting agreement which had governed allocations among North American nations since 1941, expired on March 29, 1949. Conferences to negotiate a new agreement were commenced in Montreal in September under a schedule set up prior to N.A.R.B.A.'s expiration; in December they were adjourned, stalemated by the U.S. refusal to accept Cuban demands for rights on scores of channels previously within U.S. priority. The U.S. and Cuban delegations were scheduled to confer in Havana from Feb. 1, 1950 onwards, in an effort to smooth out their differences, and the full N.A.R.B.A. conference was then scheduled to resume in the U.S. on about April 1, 1950. Nations involved were the Bahamas, Canada, Cuba, the Dominican republic, Haiti, Mexico and the U.S. (See also RADIO, SCIENTIFIC DEVELOPMENTS IN; TELEVISION.)

BROOKE, SIR BASIL STANLAKE, Northern Ireland statesman (b. Colebrooke, county Fermanagh, June 9, 1888), became prime minister on May 1, 1943. (For his early career see Britannica Book of the Year 1949).

The action of the government in Ireland in severing the last link with the Commonwealth caused Sir Basil Brooke to obtain assurances from the British government that the status of Northern Ireland would not be changed without the consent of its people. He visited London in Jan. 1949 and on his return to Belfast announced the dissolution of parliament. In the general election, held on Feb. 10, the Unionist party was again returned to power. During a visit to Britain in May he addressed the Empire Industries association and the British Empire league and visited the British Industries fair. In August he was appointed honorary air commodore of three squadrons of the R.A.A.F. In October he attended the annual meeting of the Ulster associations at Manchester and afterwards toured the West Riding of Yorkshire. He visited London in November for talks with British ministers and representatives of the E.C.A.

Louise Brough seen here winning the 1949 women's singles championship at Wimbledon against Mrs. Margaret duPont.
BROUGH, ALTHEA LOUISE, U.S. lawn tennis player (b. Oklahoma city, Oklahoma, March 11, 1923), moved with her family in 1936 to Beverly Hills, California, where she began studying tennis under Dick Sleen. By 1941 she had won the southern California junior championship. She began studying at the University of Southern California, Los Angeles, and in the national championship matches in 1943, when she was a junior at the university, lost to Pauline Betz for the women's singles title. In 1946 she was beaten by Miss Betz in the All-England tennis championships singles at Wimbledon, but, paired with Margaret Osborne, defeated Miss Betz and Doris Hart to win the doubles title. In 1947 she took four important championships: the U.S. women's singles and the mixed doubles (with John Bromwich, Australia) at Forest Hills, New York; the Wimbledon mixed doubles (with Bromwich); and the national women's doubles (with Miss Osborne). In July 1948 she matched the feats of Alice Marble and Suzanne Lenglen by winning three Wimbledon titles: the singles, the women's double (with Mrs. Margaret Osborne duPont) and the mixed doubles with Bromwich. In Aug. 1948 she won the eastern women's singles championship for the third time, taking permanent possession of the Schweikhardt Challenge cup, and for the seventh time (with Mrs. duPont) won the women's national doubles. At Wimbledon in July 1949 she took the singles title by defeating Mrs. duPont; was beaten in the final of the mixed doubles (again partnered by Bromwich) and with Mrs. duPont took the women's doubles. At Brookline, Massachusetts, on Aug. 21, she and Mrs. duPont defeated Doris Hart and Shirley Fry in the U.S. doubles. She again won the mixed doubles at Forest Hills on Sept. 6.

BROWN, DOUGLAS CLIFTON, British parliamentarian (b. London, Aug. 16, 1879), was educated at Eton and at Trinity college, Cambridge. He served in the Dragoon Guards in the South African War and in World War I. In 1918 he was elected Conservative member of parliament for Hexham and except for the years 1923-24 continued to sit in the House of Commons. He became deputy chairman of ways and means in 1938 and in Jan. 1943 succeeded Sir Dennis Herbert (later Lord Hemingford) as chairman of ways and means and deputy speaker. After the sudden death of Captain E. A. Fitzroy on March 3, 1943, Colonel Clifton Brown was unanimously elected speaker, which, although a Labour majority after the general election in July 1945 he was again elected speaker without opposition. In Jan. 1949 he accompanied an all-party parliamentary delegation to Italy where he addressed Italian deputies and senators on British parliamentary practice. It was the first time a speaker of the House of Commons had visited another parliament. In June he visited Copenhagen to take part in the celebrations of the centenary of the Danish constitution.

BROZ (TITO), JOSIP, Yugoslav statesman and soldier (b. Kumirowci, Croatia, May 25, 1892), prime minister of the federal people's republic of Yugoslavia and commander in chief, as marshal, of its armed forces. (For his early career see Britannica Book of the Year 1949).

As the propaganda campaign of all Communist-controlled countries against Tito continued during 1949 to increase in violence, the Yugoslav leader was forced to make many public replies. On Jan. 21, addressing the congress of the Serbian Communist party in Belgrade, he complained against "the false propaganda directed against a Socialist country." On April 9, at the congress of the Yugoslav People's front in Belgrade, he called for resistance to the Cominform appeal for forcible removal of the existing leadership of Yugoslavia; he also announced that Yugoslavia would not hesitate to trade with the west on equal terms in order to obtain equipment vital for industrialization. At Pola, on July 10, he announced that Yugoslavia must gradually close her frontier with Greece. In a speech to shop-workers at Belgrade on Sept. 12, he challenged the Soviet theory of the exclusive revolutionary role of the Soviet army, and maintained that progressive ideas could never be propagated by bayonets. Widening the ideological rift between Yugoslavia and the U.S.S.R., he said at Stolice, Serbia, on Sept. 27, that great powers must understand that they could not buy or sell the freedom of small nations. Addressing 600 Yugoslav generals and other officers at Belgrade on Oct. 2, Tito proclaimed that the army was prepared to defend Yugoslavia until the last breath and regardless whence the attack came. In an interview with a U.S. Progressive party member, Tito asserted on Oct. 17 that if war came to the soil of Yugoslavia "it would be no isolated situation but a world war."

BRUSSELS, TREATY OF: see Western Union.

BUDGET, NATIONAL. The year 1949 witnessed considerable progress towards the consolidation of the budgetary situation in Europe. Until about 1947-48 postwar inflation was proceeding in most countries. There were large budgetary deficits and the purchasing power created through an excess of government spending over receipts sent up prices. Higher prices affected expenditure within a very short time, while there was usually a longer time-lag before revenue adapted itself to the higher price level. Consequently, budgetary deficits and price levels tended to stimulate each other's rise in a vicious spiral. In order to arrest this process, a series of drastic monetary and financial reforms were carried out on the continent during 1947 and 1948 as a result of which it became possible to check inflation. Even if budgetary equilibrium was not reached in many countries, the size of the deficits was reduced to controllable dimensions. A number of countries even succeeded in balancing their budgets. Nevertheless, conditions remained inflationary, no longer on account of budgetary deficits but through rising wages and the inadequacy of supplies of consumer goods to meet demand. To correct the situation, a "disinflationary" budgetary policy was adopted in Great Britain and other countries, but the struggle was not an easy one. The government had to balance up excessive purchasing power through revenue surpluses.

The basic principle of such disinflationary budgetary policy was that it was directed both against purchasing power created through excessive government spending and against demand for goods through rising personal earnings. It differed from a deflationary budgetary policy in that it did not aim at causing a fall of prices and wages. The difference was one of degree but, although disinflationary budgetary policy was compatible with a policy of full employment, a deflationary policy was not.

During 1949 anti-inflationary efforts dominated budgetary trends in Europe. Non-stop inflation came to an end everywhere, with the exception of Greece where the conditions created by the civil war made it impossible to deal adequately with budgetary and monetary problems. The reforms carried out in 1947 and 1948 in Germany, Italy, Rumania and Hungary resulted in progress towards budgetary equilibrium.

Most countries sought to stabilize their budgets around their high postwar level: no substantial attempts were made towards budgetary deflation. The governments concluded that it was easier to maintain taxation at a high level than to carry out drastic cuts in expenditure. This attitude was in keeping with the change in the balance of power in domestic policies that took place in Europe after World War II in favour of socialism. Even in countries where socialists did
not actually control the government, their influence was strong enough to enforce budgetary policies favouring a process of levelling down incomes and fortunes by means of high taxation rather than a reduction of expenditure through curtailing social service charges (which rose considerably everywhere after World War II) for the sake of granting taxation relief. Moreover any large cuts in expenditure would have caused unemployment, directly or indirectly. With the exception of Belgium and Italy, none of the European countries ventured on such an unpopular course because, apart from any other reasons, it was feared that the discontent aroused by such a budgetary policy would allow Communists to strengthen their influence among industrial workers.

Precautionary national defence expenditure in western Europe rose. Although the United States agreed in 1949 to provide assistance for countries of the North Atlantic treaty in the form of arms delivery free of charge, the countries concerned had to undertake to strengthen their defences. Fortunately this happened after most countries had generally succeeded in restoring their systems of production and clarifying their monetary and budgetary situation. Had it become necessary to embark on rearmament a year or two earlier it might easily have aggravated the budgetary problem and led to chaotic monetary and economic conditions. Even so, military requirements went a long way towards neutralizing disinflationary policies in some countries and materially increased the difficulty of achieving equilibrium.

Expenditure on social services tended to rise in Great Britain, France and other countries where some postwar measures were beginning to produce their full effects by 1949. In particular the item of subsidies weighed heavily in the budgetary situation. In France they cost twice as much as other social service charges. Food subsidies adopted in Great Britain in 1940 as a temporary palliative had in recent years to be regarded as an instrument of economic and social policy, aiming at reducing the cost of production by keeping down the cost of living. They were, too, intended to ensure that the poorest classes would be able to buy primary necessities at low prices.

European postwar budgets thus departed considerably from the conception that budgetary policy must be a fiscal instrument with the sole aim of collecting necessary revenue for covering indispensable government expenditure. Apart from control by taxation, the new social principles that guided public expenditure also constituted powerful weapons in the armoury of economic policies. They resulted in the employment of an increased amount of public funds on social services and the devotion of a larger proportion of national resources than before World War II to capital expenditure.

Reconstruction expenditure in former belligerent countries of Europe continued to absorb substantial amounts. Progress was made everywhere, even in Germany, towards the rebuilding of houses and industrial plants destroyed during World War II. Nor was this the only form of capital expenditure calling for large resources. Most European countries were proceeding with ambitious schemes of public works, modernization of industry, improvement of transport systems and housing programmes. Although these capital expenditure items were segregated in most budgets from current expenditure, they remained none the less part of the budgetary burden.

Although such capital expenditure chiefly aimed at a rapid increase in productivity, a considerable proportion could not produce higher output except indirectly or over a long period. Some of it, however, was directed towards improvement of living conditions rather than to an increase of productivity, or pursued educational or cultural aims. In Great Britain the application of the Education act of 1944, which raised the school leaving age, necessitated substantial capital expenditure in 1949, in the form of an ambitious programme of school building.

Public administration expenditure continued on a very high level in most European countries, owing to an increase in the number of government officials compared with prewar figures. The extent to which de-rationing and de-control
made it possible to reduce their number was small. It was not until towards the end of 1949 that Great Britain embarked on an economy drive aimed mainly at reducing administrative expenditure and even this effort was modest.

In 1949 government expenditure generally was more carefully scrutinized. In Great Britain, Sir Stafford Cripps (g.v.) as chancellor of the exchequer introduced a more austere policy than his predecessor had followed, and declared that in future no supplementary estimates should be submitted by government departments unless they arose from changes of policy. Notwithstanding this principle, he later found it necessary to yield to demands for supplementary allocations of funds through the unexpected increase in the cost of the national health service and national defence. As a result, expenditure exceeded revenue by some £20 million during the first two quarters of the fiscal 1949-50, compared with a large surplus of revenue during the corresponding period of the previous fiscal year.

In continental countries where the budget deficit was large it was difficult to enforce rigid economies precisely because of the psychological effect of the large size of the deficit. For example: if the revenue was within 5% of that of the expenditure it would be comparatively easy to overcome resistance to a final effort to bridge the narrow gap, for the nearness of the goal would strengthen the government's determination to achieve a slight reduction of expenditure or a slight increase in revenue. If, however, the gap represented 25% of the expenditure, then there was little inducement to face unpopularity for the sake of reducing it to 20%. Indeed there was a strong temptation to add to the deficit for the sake of incurring useful or popular additional expenditure. Nevertheless most continental governments made a praiseworthy effort to resist the temptation and to embark on the unpopular task of reducing expenditure although in some instances the goal of eliminating it remained remote.

The amount of the public debt continued to increase in a number of countries, as a result of budgetary deficits, capital expenditure programmes or nationalization schemes with compensation. There was no possibility in any country of saving much expenditure on interest through conversion operations. In fact interest rates tended to increase. In countries where devaluation of the national currency was followed by an all-round upward adjustment of taxable capacity, the relative real burden of the public debt declined in spite of an increase in its nominal amount. It was for this reason that devaluation on the continent tended to facilitate the solution of budgetary problems, by reducing the proportion of revenue that had to be earmarked for the service of the public debt. Although as the immediate result of currency depreciations budgetary difficulties were aggravated through the more rapid increase of public expenditure, during a long spell of monetary stability, which followed depreciation, the increase of revenue was able to catch up and exceed the increase of expenditure. Hence in 1949 came the improvement of the budgetary situations in various European countries which had devalued their currencies during previous years.

The budgetary problem remained one of the causes of political instability in France where the peculiar character of the balance of power between the political parties made it particularly difficult for any government to adopt unpopular measures of expenditure or to increase revenue. The effort of the government of Georges Bidault to balance the budget for 1950 through the adoption of new taxes in Dec. 1949 nearly caused a cabinet crisis.

The "dollar crisis" that developed during the summer of 1949 made it necessary for Great Britain and other countries suffering from a scarcity of dollars to make an additional effort to cut expenditure. Realization of the need for this constituted a departure from the postwar conception under which it was believed that, as a result of practically watertight exchange control and other restrictions, a country was in a position to isolate its internal economy from international influences. Under this conception it was considered possible to distribute purchasing power through high public expenditure without thereby causing a deterioration of the balance of payment through smaller exports and far larger imports. The experience of 1949 made many governments realize, however, the existence of the close connection between budgetary policy and trade balance. The postwar conception of "spending our way into prosperity" and letting the balance of payments take care of itself gave way to more prudent conceptions even though the extent to which the latter were actually put into operation varied from country to country.

The devaluation of the pound and other currencies in September was effected too late to produce any visible effects on the budgetary situation during the calendar year 1949. In Great Britain the government endeavoured to reduce to a minimum the effect on public expenditure. Indeed efforts were made to carry out cuts in spite of the natural rising trend of expenditure that, in the experience of France, Italy and other continental countries, accompanied devaluation.

The moderate extent to which devaluation in Great Britain was followed by a rise in prices contrasted sharply with earlier continental experience. The difference was due to the fact that, although continental countries had been forced to devalue repeatedly by rising prices caused by their budgetary deficits, the British budget was balanced at the time of the devaluation of sterling. Several continental countries were in a less favourable position in this respect. Nevertheless, by 1949 their budgets were more under control than on the occasion of previous devaluations and such deficits as persisted were not of an extent to cause non-stop inflation. For this reason, even on the continent the devaluation of national currencies did not set in motion on this occasion a vicious spiral in which an uncontrolled rise in prices caused a widening of the budgetary deficit.
Expenditure on international activities was placed at $4,711 million in the 1950-51 budget. This was about $1,300 million less than estimated expenditure in 1949-50. The reduction reflected chiefly the declining costs of the European Recovery, and other recovery and relief programmes. The president noted that recovery and relief costs, which in 1950-51 estimates formed three-fourths of international expenditures, would diminish rapidly, but that programmes for stimulating foreign economic development would assume increased importance and that expenditures for foreign military assistance would remain substantial for several years. The budget included, as proposed legislation, an initial outlay of $25 million for furnishing technical assistance to economically undeveloped areas (the Point Four programme). Expenditures under the Mutual Defence Assistance pact of 1949 for supplying arms to the North Atlantic treaty nations and for rendering military assistance to Greece, Turkey and certain other areas in the middle and far east were estimated to require $645 million in 1950-51.

BUENOS AIRES. Capital of the republic of Argentina, the largest city in the southern hemisphere and of Latin America, and the largest Spanish-speaking city of the world. Area (federal district): 71 sq. mi.; pop.: (1914 census) 1,576,597, (1947 census) 3,000,371.

Although 1949 was a year of economic disturbance and political rumours, the Porteños (citizens of Buenos Aires) were aware that the natural wealth of their country was unaffected by the transient crisis, and were confident that the fertile hinterland of the republic could well sustain the capital's extravagances.

(B. P.)

BUILDING AND CONSTRUCTION INDUSTRY. The principal subjects under discussion during 1949 in the building industry of Great Britain were the introduction of schemes of incentive payments and the continuation of the system of licences.

Operatives' output which was considerably below the 1939 level was one of the chief causes of the rising cost of building and it was suggested that it could only be raised by incentive payments. The wage arbitration of 1947 gave half the additional sixpence an hour that had been claimed but included provision for incentive schemes in order to allow the earning of wages above the basic rates. Employers were slow to operate such schemes on an extensive scale in spite of official encouragement from the National Federation of Building Trades Employers and the Ministry of Works, both of which published booklets giving guidance on their running. Some progress, however, was made in 1949 though...
there were many kinds of work which did not lend themselves
to organization in this way. Trade union leaders complained
that far too few men were being given the chance to supplement
their wages and that basic wages must be raised if employers were not prepared to operate bonus schemes
more widely.

Official control of the licensing of work and of the supply of
certain materials was continued throughout 1949 though
there had been considerable relaxation of these controls in
Nov. 1948. The changes did not affect housing work or the
supply of steel or timber and builders complained that such
hand-to-mouth procedures made it impossible to balance future programmes of work satisfactorily and thus increased
operating costs.

The volume of maintenance and repair work which needed
to be undertaken in consequence of the neglect of property
during World War II resulted in a considerable increase
after the war in the number of very small firms, a category
already over-large. This trend seemed to be arrested during
1949 partly because of financial difficulties. On the other
hand the size of certain larger units was increased by the
amalgamation of firms. The working party set up by the
Ministry of Works in 1948 to enquire into the operation of the
building industry continued to take evidence from a
wide variety of sources. A productivity team also visited
the United States for six weeks during July and August to
study building methods. Although representing a variety of
interests the members of the team agreed that production
per man-hour in the United States was half as great again
as in Great Britain though opinions differed as to the extent
to which this was due to higher wages, better diet, the spur
of unemployment, or to there being no shortages to upset
planning and cause frustration.

Both the Ministry of Works and the Building Research
station issued publications on the progress of research and
on the development of constructional techniques which were
well received in responsible quarters. But although there
was appreciation of the quality and value of the work being
done, distrust of experiments in new structural techniques
was also widely expressed and a return to traditional methods
of house building advocated. The fact, however, that this
suggestion was frequently associated with the demand for
the removal of restrictions on the speculative building of
houses for sale caused the motives behind it to be questioned,
the more so since it was admitted that the new techniques
were essential if the school building programme was to be
adequate.

Owing to the shortage of steel and timber reinforced
concrete construction was used a great deal for large buildings
in place of structural steelwork and new British Standards
and Codes of Practice permitted more economy in both
techniques. An outstanding result of the steel shortage was
the widespread interest in design and construction of pre-
stressed concrete structures. During 1949 both bridges and
buildings were completed using this method of construction
and small section floor joists were being mass produced to
take the place of timber. Hardwood was freed from control
in April but supplies of softwood were further threatened
by import cuts and devaluation. The Timber Development
association suggested that it would be sound economy to export more steel and import more timber but there was no indication that official policy was influenced.

Recruitment to the building industry caused some anxiety,
the intake of apprentices to the skilled trades being less than
that required to maintain its strength. Many reasons were
advanced for the deficiency. Employers complained that
there was insufficient licensing of work suitable for the
training of apprentices and that the outlook was too un-
stable for them to be able to bind themselves as parties to a
five-year apprenticeship. On the other side it was stated
that a building trade apprenticeship compared unfavourably
both financially and socially with other occupations open to
youths of 15 or 16 years of age. A leading employer empha-
sized that adequate recruitment was essential to the future
health of the industry and asked whether a five-year appren-
ticeship was necessary for all the building trades. There
was, at the same time, a growing interest in schemes for
training future executives and for attracting university men
to the industry.

After 1939 few outstanding buildings had been put up in
London and it was, therefore, something of an occasion when
work commenced on the new concert hall on the south bank
of the Thames in preparation for the Festival of Britain, 1951.

(D. A. G. R.)

United States. Total expenditures for new construction
in the United States during 1949 reached a new record of
$19,329 million which exceeded by more than $500 million
the 1948 record of $18,775 million. Building of new homes
passed the million mark for the first time in the nation's
history. The physical volume of new construction in 1949
was probably even greater than the $500 million increase in
expenditure would indicate since unit costs were somewhat
lower than in the previous year.

That new building reached record levels in 1949 was due
to a $1,000 million increase in public construction of all types
by federal, state and local governments. Private construction
amounted to $14,000 million which was $500 million lower
than in the preceding year. The drop was more than offset
by the increase in public building to $5,300 million which was
25% more than had been expended during the previous year.
More than half of this increase resulted from expanded
programmes of school and hospital construction.

Although 1949 home building achieved a record in number
of new units, total expenditure amounted to $7,000 million,
approximately 3% below the 1948 figure. This fact was
accounted for by somewhat lower construction costs, the
building of a larger proportion of less expensive dwellings
and work remaining to be completed at the end of the year
on the large volume of home building which was started late.
Expenditures for public housing (homes for families with
small incomes, financed and subsidized by federal, state or
local government agencies) more than doubled in the year
although the volume of such construction was still relatively
small. The large scale public housing programme authorized
by the Housing act of 1949 did not begin to make itself felt.

Increased construction was also marked in the field of
institutional buildings such as churches, privately supported
hospitals, recreational buildings and private (including
parochial) schools. Privately owned electric and gas com-
panies also substantially increased their construction activities.

Material costs had begun to drop in Nov. 1948 and con-
tinued to ease downward through the first half of 1949.
Actual price reductions for major components, except lumber, were modest. Lumber, which had shown the biggest
postwar increase, was freely available at substantially lower
prices. In the Bureau of Labour Statistics index of wholesale
prices, lumber, which in Aug. 1948 reached a peak of 319-9
(1926 = 100), had dropped to 277-4 by July 1949, but then
moved up to 279-6 in September.

Equally as important as price reductions for materials
were the return of competitive bidding for construction contracts on a fixed price basis, an ample supply and ready
flow of materials which made for more efficient and speedier
construction and increased labour productivity with fewer
premium payments above the union wage scale.

In May 1949 construction contractors had 2,010,000
employees at work which represented a gain of 75,000 over
the preceding month but was still 42,000 under the figure for
May 1948. By December, however, employment was 2,109,000—the highest level for that month in the 10 years for which Bureau of Labour Statistics records were available.

Although building and construction ended 1949 on a far stronger note that it did the preceding year, forecasts for 1950 were still on the cautious side. The joint estimate of the Department of Commerce and the Department of Labour's Bureau of Labour Statistics foresees one year ahead in which $19,000 million would be spent on construction but with expenditure on private building $925 million less than in 1949 and a further increase in public construction to make up the difference. Private home building and most other types of private construction were expected to slacken. Employment, it was thought, would equal 1949 levels and there would be no substantial change in construction costs. (See also HOUSING.)

BULGARIA. A people's republic in the eastern part of the Balkan peninsula, bounded on the north by Rumania, on the west by Yugoslavia, on the south by Greece and on the east by Turkey and the Black sea. Area (including southern Dobruja): 42,796 sq. mi. Pop. (Dec. 31, 1946, census): 7,022,206 of whom 1,662,255 were urban and the remainder rural. Languages (1947 est.): Bulgarian 88%, Turkish, 9-8%, Religious (1947 est.): Greek Orthodox 84%, Moslem 11-5% (one-sixth of them being Pomaks, or Moslem Bulgars, the remainder being Turks); Roman Catholic 0-9%; Gregorian Armenian 0-4%; Jewish 0-3%; Protestant 0-2%.

Chief towns (pop., 1947 est.): Sofia (cap., 434,888); Plovdiv (125,440); Varna (77,792); Russe (53,420). Chairman of the presidium of the National Assembly (Sobranie), Dr. Mincho Neychev; prime ministers in 1949, Gheorghi Dimitrov (see OBITUARIES) and (from July 20) Vasil Kolarov (g.v.); minister of foreign affairs (from Aug. 6), Vladimir Poptomov.

History. There was no significant change in the political structure of Bulgaria, which had been politically sovietized already in 1948. In Feb. 1949 it was announced that two small parties belonging to the governmental Fatherland (Otechestven) front, Zveno and the Radicals, had decided to dissolve themselves and to merge into the front. Zveno was originally a moderate republican party, based on the middle class and appealing especially to army reserve officers, which had taken part in the 1944 revolution but had lost its most active members by purges in 1946-48. The Radical party, founded at the beginning of the century, was a weak middle-class party. With their disappearance, the Fatherland front consisted only of Communists and rump Agrarians, the latter having in fact no independent influence. But in practice the front had been rigidly controlled by Communists ever since the summer of 1945.

In July the leader of the Communist party, Gheorghi Dimitrov, died in the Soviet Union. Having lain in state in Moscow, his corpse was brought back to Sofia, where a state funeral was staged, closely modelled on that of Lenin. Like Lenin, Dimitrov's corpse was to be embalmed and placed on view in Sofia. As in the case of Lenin, Dimitrov's successor as party leader, his brother-in-law Viko Chervenkov, made an oration over his body consisting of a series of "commandments" and "oaths," exactly copied from the oration of Stalin over Lenin's body in 1924 and imitating even the liturgical style of the ex-seminarist.

The new prime minister was Vasil Kolarov, like Dimitrov a former secretary of the Comintern. Under him were five deputy prime ministers forming, as in the government of the U.S.S.R., an inner cabinet. The five men chosen were

The body of Gheorghi Dimitrov, who died on July 2, 1949, at the temporary mausoleum in Sofia where he was buried on July 10. Above is Marshal Kliment Voroshilov (in uniform). The mausoleum was opened to the public on Dec. 10.
Chervenkov himself, Dobri Tarpeshev, Anton Yugov (all three Communists), Gheorghi Traikov (rump Agrarian) and Kimon Gheorghiev (former Zveno). Chervenkov, most of whose political life had been spent in exile in Moscow, was the most powerful man in the country. The new minister of foreign affairs, Vladimir Poptomov, was also a “Muscovite.” Yugov and Tarpeshev on the other hand had spent their time either in prisons or in underground activity in Bulgaria.

The biggest political event of 1949 in Bulgaria was the “unmasking” of Traicho Kostov (q.v.), second secretary of the Communist party under Dimitrov. On March 26-27 a special session of the party’s central committee decided to remove him from the Politburo. His crime was an “insincere attitude” to the Soviet Union, and “insincerity in self-criticism” after his error had been pointed out to him by his comrades. As one of the chief organizers of the Bulgarian economic plan, he had applied the existing rules about commercial and industrial secrets to Soviet citizens as to the citizens of other foreign states. By so doing he had proved guilty, in the words of Dimitrov, of “the shameful assumption” that the state interests of the Soviet Union could ever be contrary to those of Bulgaria. Kostov was later expelled from the party itself and in July his parliametary immunity was cancelled and he was arrested. On Nov. 29 it was announced that he would be tried for conspiracy, espionage and high treason. The Yugoslav Communist leader Moshe Pijade grimly commented on this that Kostov had evidently required a great deal of “preparation” and rehearsal in the role he was to play at the trial.

“Kostovism” proved a useful label for economic failures. In the Five-Year plan which began in 1949, Bulgaria was to convert 60% of agricultural output to collective ownership. In practice it seemed that party officials pressed too fast ahead with collectivization. In June a party statement denounced “left-wing sectarianism” in agriculture, and attributed the wrongful use of force against peasants to the influence of the disgraced Kostov. In October the ministers of finance and railways, Petko Kunin and Stefan Tonchev, were dismissed. Throughout the year there were complaints of low productivity and swift changes of employment among the workers.

A new Church law was introduced on Feb. 24. Under article 12 of this law, any minister or religious officer who “offends against public order or morality” or “works against the democratic institutions of the state” might be temporarily suspended or dismissed from his office by the Ministry of Foreign Affairs. In this case, the minister of foreign affairs would inform the leaders of the religious community concerned. If they did not take action against the guilty person, he would be “suspended by administrative order.” These phrases were of course capable of wide interpretation by the Bulgarian secret police and Communist party officials, whose views the minister of foreign affairs was certain to carry out.

From Feb. 25 to March 6, 15 Bulgarian Protestant pastors were tried for espionage and subversive activities against the government in the interest of the “western imperialists.” It was clear from the proceedings of the trial that the crime of these men was that they had had American or British friends, with whom they had spoken freely and critically of Bulgarian politics. Protestantism had few followers in Bulgaria, but as one of the communities which had long established connections with the Anglo-Saxon world, it was an inevitable target of official repression.

(H. S.-W.)

Education. (1947-48) Elementary schools 9,238, pupils 889,854, teachers 28,957; secondary schools 258, pupils 152,661, teachers 5,229; technical schools 207, pupils 32,968, teachers 1,051; universities and colleges 9, students 49,800, professors and lecturers 1,283.

Agriculture. Main crops (1948, in ‘000 metric tons) wheat 1,470; maize 890; barley 250; oats 105; tobacco 68. Livestock (in ‘000 head): cattle (July 1947) 1,711; sheep (Dec. 1947) 9,000; pigs (July 1947) 1,028; horses (Dec. 1946) 549; poultry (Sept. 1947) 10,293.

BUNCHE, RALPH JOHNSON, United Nations official (b. Detroit, Aug. 7, 1904), graduated from the University of California, Los Angeles, California in 1927 and received a master’s degree at Harvard university in 1928 and a Ph.D. in 1934. He taught political science at Howard university, Washington, D.C., becoming a full professor in 1938. In the meantime, he travelled through French West Africa on a Rosenwald field fellowship, studying and comparing the administrations of French Togoland, a mandated territory, and Dahomey, a colony. He was later awarded a post-doctoral fellowship from the Social Science Research council and studied at Northwestern university, Evanston, Illinois, and the London School of Economics in 1936 and 1937 before returning to Africa for further studies of colonial policy. During World War II he served in the Office of Strategic Services, being the head of its Africa section, 1943-44, and in the Department of State from 1944. He joined the United Nations secretariat as director of the division of trusteeship in June 1946. In 1948 he was appointed to assist Count Folke Bernadotte of Sweden as mediator between the Arabs and Jews in Palestine and when Bernadotte was assassinated on Sept. 17, 1948, he became acting mediator and supervised the truce and armistic agreements. In May 1949 he rejected an offer for an appointment as U.S. assistant secretary of state for near east and African affairs. In August Bunche was relieved of his mission as acting mediator for Palestine to resume his post as director of the U.N. division of trusteeship.

Dr. Ralph J. Bunche receiving the Spingarn medal from Mrs. Vijayalakshmi Pandit, Indian ambassador to the United States, on July 17, 1949, for his work as U.N. acting mediator in Palestine.
In July 1949 he was awarded the Spingarn medal, awarded annually by the National Association for the Advancement of Coloured People, and in October received the degree of doctor of humane letters from the Jewish Theological Seminary.

BURMA, UNION OF. An independent federal republic lying on the eastern side of the Bay of Bengal, between Pakistan and India on the north, Tibet on the north and China, Indo-China and Thailand (Siam) on the east. The republic comprises Burma proper, the Shan state, the Kachin state, the Chin special division and the Karen state)—this last to include, as well as the Hill Karens, the Karens of the plains, who had yet to resolve their internal differences. Area: 261,749 sq. mi.; pop. (1941 census): 16,823,798. Racially, the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. The largest indigenous minorities were: the Karens who numbered 1,367,673 in 1931 (of whom 218,790 were Christians), the Shans (1,057,406 in 1931) and the Chin-Kachin group (c. 750,000). The largest immigrant minorities were: the Indian population numbering 1,017,825 in 1931, divided equally between Moslems and Hindus, and the Chinese who by 1941 were about 380,000. Chief towns: Rangoon, capital and main port (pop. 1941, 501,291); Mandalay (pop. 1941, 163,537); Moulmein (pop. 1931, 65,506); Bassein (pop. 1941, c. 50,000) and Akyab (pop. 1931, 38,094). President of the republic: Sao Shwe Thaik (q.v.); prime minister: Thakin Nu (q.v.); minister of foreign affairs: U Maung.

History. The year 1949 opened disastrously for Burma. As 1948 drew to a close, all hope of early recovery dwindled away. Negotiations with the Karens broke down and Karen bands overran more and more areas, even to Insein, at the very gates of Rangoon. The "White Band" section of the People's Volunteer organization (P.V.A. in Burmese) continued to defy the government, despite the efforts of a peace mission under U Thwin; and Communist hostility remained as implacable as ever. Essential goods fell into short supply, and prices rose steeply. Timber, rubber and mineral production was interrupted, with great loss to the national income and the state revenue. The budget for 1948-49, introduced in Sept. 1948, was already falsified by Jan. 1949.

The government, however, still had some degree of control. The administration, though damaged, was substantially intact; communications, though often cut, were generally open; in particular, the Rangoon-Mandalay railway ran regularly from mid-December. The 1948 rice crop was successfully garnered. At this stage, the government made a serious miscalculation. An attempt to disarm the Karens was resorted to, and sent the 3rd Karen Rifles at Prome into revolt. On Jan. 31 an attack launched on the Karens at Insein was repulsed, and settled down to a long siege, with much destruction of property. A rifle attack on the same day against the Karen settlement in west Rangoon caused much damage by fire, and some loss of life. The rift between the two communities was almost complete.

The Karens now took the offensive. By April they controlled the railway area from north of Pegu to Mandalay and Maymyo, and westwards to Myingyan on the Irrawaddy. South of Rangoon, they held Thaton, dominated Moulmein and threatened Tavoy and Mergui. Karen and government control alternated in Bassein and some other delta areas, and Karens held the Twante canal.

Other insurgent forces were in the field. White P.Y.A. held Dala (opposite Rangoon), Pegu, and some delta towns. Allied in an uneasy Democratic front with the Communists, they also controlled most of the riverine districts from Prome to just south of Magwe. They were strong enough to threaten Tavoy in the south. Communists held Pyapon and some other delta towns and had centres in many other areas. Arakan was almost completely out of control.

In fact, the government's writ ran only in Rangoon, a few headquarter towns and in the backward areas comprising the Shan states and the northern districts, where control was at all times of the lightest. Communications were completely disrupted and the administration was thoroughly disorganized. Timber extraction ceased and reconstruction in the Yenangyaung oilfield ended. This point marked the peak of the rebels' success. With the rains in the offing, their men began to melt away to their homes; and by June the government had re-occupied Meiktila, Mandalay, Maymyo, Yenangyaung and Kyaukse in upper Burma, and Moulmein, Thaton, Insein and Twante in lower Burma. Twante was important. Its recapture released large rice supplies and a total export for 1949 of 1,300,000 metric tons was in sight.

Thus, by the middle of the rains, the government faction was still the strongest in the field, except in Arakan, the Toungoo-Karenni area and parts of the southern Shan states, where the Karens made an incursion and firmly held Taunggyi. The country, however, was exhausted, devastated and terrorized by rival gangs and was in no mood to hold elections or plant wide areas for next year's export market. The district administration, of fundamental importance in Burma, was broken in pieces, and the treasury was bankrupt. The outlook for 1949-50 was thus ominous.

In the political field, 12 months had seen a great change. On Sept. 14, 1948, the cabinet was increased to 21 members, as a bid, doubtless, for wider support. This, however, was not forthcoming, and splinter groups and new parties began to form. The Anti-Fascist People's Freedom league began to disintegrate rapidly, and soon the Socialists were left as the dominant party. In the country, however, they were unpopular and Thakin Nu, as the one man who could steer a middle course, was indispensable to all parties as premier. Early in the new year he was able to force the resignation of the Socialist ministers; the cabinet was cut down to 12 and most of the seats were filled with non-Socialist supporters of government. The Socialists, however, still controlled the Assembly, and so could cause the government much embarrassment. No election had been held after the declaration of independence, and existing conditions scarcely permitted the holding of one.

These events and the Communist success in China turned the thoughts of Burma increasingly towards the west. India called an informal conference in February at Delhi of Pakistan, Ceylon, Australia and the United Kingdom to suggest mediation in Burma, but this was precipitate and mediation was rejected. Desultory discussions, however, between Burma and the Commonwealth continued but led to no definite result. Discussions with the United States and the international monetary authorities were equally inconclusive.

The rains damped down military operations and so revived discussions of ways to procure a settlement. After some consideration, the government in mid-September launched a "peace in one year" campaign. They rightly thought that civil war to outrace would cause irreparable damage and seemed ready to consider all means of reaching a peaceful settlement. In this, a major factor would be an agreement with the Karens. As the rains drew to a close, signs of increasing rebel activity gave point to the necessity for early action. The need for more regular troops, and the disarming of undisciplined units with no reliable allegiance, already obvious, became imperative.

The widespread disorders further impaired the country's finances, already precarious. The first accounts figures for
1948-49 showed a deficit of Rs. 74 million and even this figure was of doubtful validity. The budget for 1949-50 envisaged a deficit of Rs. 17 million but this was based on an unrealistic revenue figure, and included transfers from the development fund, which were not revenue at all. A new factor was the government's new economic policy. This divided industry into three groups: (a) national industries, (b) private enterprises to be nationalized later and (c) industries open to private enterprise without restriction. It was too early to say if this would attract much-needed foreign capital. As, however, there was no provision for paying for industries already nationalized, the outlook in this respect was not hopeful.

(R. M. MacD.)

Agriculture. Main crops ('000 metric tons, 1948) rice 5,287, ground-nuts 142; cottonseed 9; sesame (1947) 43 c, cotton 1; tobacco (1945-46) 22.7. Livestock ('000 head, 1948): cattle 5,207; sheep 21; pigs 402; oxen 5,207; buffaloes 701, horses 12, hogs 394, goats 172. Fisheries: total catch estimated at 500,000 tons annually.

Industry. (1947) Factories 473, persons employed 46,860. Raw materials (metric tons, 1948): natural rubber (net exports) 9,204, timber, both softwood (target production 1948-49) 210,000, tin concentrates 1,118; lead on smelter bases 7,562; zinc ore 3,185; silver (fine ounces) 450,000.

Foreign Trade. Imports (1948) Rs. 797 million, (1949, six months) Rs. 450 million; exports (1948) Rs. 593 million, (1949, six months) Rs. 294 million.

BUSINESS REVIEW. During 1949 business conditions continued to be affected by the deferred effects of wartime abnormalities. Generally speaking, however, business activity was determined to an increasing extent by peacetime factors. This did not necessarily mean that conditions improved in the same proportion as wartime abnormalities gave way to influences of peacetime economy. For the latter, too, was far from normal. The two principal disturbing factors were the trade recession in the United States during the first half of the year and the devaluation of sterling and a number of other currencies in Sept. 1949. Although it was possible to regard both factors as originating indirectly from the aftermath of World War II, in reality they were due to disequilibria which form part of peacetime economy.

The factors which dominated business conditions during previous postwar years were the scarcity of goods, a disability inherited from the war, and the inadequacy of the productive capacity of the European late-belligerent countries. During 1949 both these factors continued to subside. Industries rebuilt their stocks of raw materials, except in goods imported from hard currency countries. Wholesale and retail merchants, whose stocks were nearly exhausted by the end of the war, had replenished their supplies. Indeed in many instances they came to carry rather more than they wanted to, owing to a fall in demand in many lines. The range of goods available to the consumer widened considerably during 1949. This was not an entirely healthy symptom, however, as it was the result of the partial failure of the attempt by various governments to reserve for foreign markets the best of the national output. The impossibility of selling all such goods abroad compelled the governments concerned to release them for sale on the domestic markets and these "frustrated exports" added to the domestic consumers' freedom of choice.

Industrial production continued to increase in Europe and also in the countries of the Commonwealth, with the exception of Canada where it declined during the first half of 1949 in sympathy with the trend in the United States. Among European countries, those which had been affected most by World War II showed the greatest recoveries. In particular the index of the industrial production of western Germany showed a gratifying progress towards prewar level. The manufacture output of Great Britain and most western European countries had long passed that mark and in 1949 they showed further noteworthy gains. British dominions which during the war made considerable progress towards industrialization succeeded in consolidating their advance and even added to it.

With the disappearance of the sellers' market in most kinds of consumers' goods, the possibility of difficulties through industrial overproduction was continually being considered by governments and business firms. The difficulty of exchanging the manufacture surpluses of western Europe for the food and raw material surpluses of eastern Europe became more evident as a result of the spectacular recovery of industrial production in Western Germany; but fears that a revival of German competition might lead to unemployment or a full wages in Great Britain and the industrial countries did not yet materialize.

The setback in business in the United States affected Europe and the Commonwealth partly through a decline in American prices of raw materials and manufactures and partly through a decline in American imports. Since, notwithstanding the European Recovery programme, the dollar reserve of most countries remained uncomfortably low, this decline of dollar-earning exports of European manufactures and of Commonwealth raw materials considerably aggravated the situation. Moreover, as there was no decline in the prices of European industrial products, the cuts in American manufacture prices threatened the markets for British and western European exports in Latin America and elsewhere. So far from trying to compete with lower American prices, the prices in most European countries continued to increase during the second half of 1948 and showed no material fall during the first three quarters of 1949. Even though the British government and other governments adopted disinflationary devices they were unable to arrest altogether the rise in wages and prices. In France the devaluation of the franc in 1948 produced its full effect on prices by the end of that year, and the reaction during the first half of 1949 was moderate. Even in Italy, which was the only European country to adopt deflation on orthodox lines, prices continued to rise at the beginning of 1949, although subsequently they showed a marked decline accompanied by unemployment on a fairly large scale. In Belgium, too, there was a fair amount of industrial unemployment.

On the other hand, Great Britain and most other western European countries continued to pursue their policies of full employment and, as a result, the purchasing power of consumers was fully maintained.

The devaluation of sterling and many other European and Commonwealth currencies towards the end of the third quarter of 1949 constituted an important landmark in the business history of the year and, indeed, of the postwar period. Anticipation of this step during the preceding months influenced business conditions to no slight extent. There was a decline in the demand for British and sterling area goods, in the hope of being able to buy them cheaper after devaluation. When on Sept. 18 sterling was devalued by 30%, an example followed by the entire sterling area (with the exception of Pakistan) and by many other countries besides, the fear of large-scale deflation was removed. Previously there had been the possibility that the declining trend in the United States
might force Great Britain and other countries sooner or later to follow the American example. There was, indeed, a growing fear of a postwar slump during the second quarter of 1949. From the point of view of business activity the British decision to take the line of least resistance by devaluing instead of deflating was greeted with relief, all the more so since the rigidity of wages under full employment would have made deflation impossible beyond a certain point. Moreover, the substantial extent of the cut in the dollar value of the pound and other currencies provided the countries concerned with a fairly wide safety margin. They were placed in a position to allow their wages and prices to rise a little without thereby relapsing into the state of disequilibrium from which they had escaped through deflation. This meant that they were able to meet the most insistent wages demands instead of provoking an epidemic of strikes by rigidly resisting them.

During 1949 business activity in Great Britain, France, Italy, Australia and other countries was often disturbed by strikes over wages or working conditions. A large proportion of these disputes were believed to have been engineered by Communists for political purposes by stimulating and exploiting discontent among dock labourers, miners and other workers. The extent of these strikes was not such as to check progress towards industrial reconstruction. On balance, business conditions continued to improve, a fact which was largely due to the ability of western European countries to maintain their essential imports through the European Recovery Programme.

In eastern European countries the process of postwar consolidation continued. The currency reforms carried out in various eastern European countries during the previous two years consolidated monetary conditions and the non-stop inflation in Hungary and Rumania gave way to a period of comparative stability. The effect of the nationalization of most industries on the output in countries under the Soviet sphere of influence could not be judged clearly from the conflicting reports received. Most of their business activities were conducted by government organizations.

In western Europe the setback in business profits recorded in 1948 continued in 1949, although in many lines the postwar boom continued unabated. There were signs of greater selectivity, owing to the disappearance of the virtual certainty that prevailed during earlier postwar years that it was possible to sell at a profit anything produced, regardless of cost or quality. With the increase of competition at home and abroad the industries concerned had to make an effort to cut down superfluous expenditure. The strong political and economic position occupied by labour, especially in Great Britain and France, made this process often very difficult, for dismissals for redundancy might be accompanied by strikes. In particular in the nationalized industries the closing down of uneconomical pits or works encountered strong resistance. Nevertheless it was impossible to avoid local and temporary unemployment in some industries such as shipbuilding: but many industries engaged in the production of heavy capital equipment continued to work to capacity and remained fully booked for years ahead. Demand for electric power stations and for new machine tools continued unabated both within the countries producing such equipment—Great Britain, Belgium, western Germany, France, Italy and Sweden—and elsewhere.

Mechanization and modernization continued to make progress but were handicapped by lack of exchange to import the necessary equipment or by the need for exporting much of the equipment produced within the countries, in order to obtain the means to pay for essential imports. The increase in output was the result of mechanization rather than of an increased exertion on the part of the manpower employed. In Great Britain and other industrial countries the limited supply of electric power set a limit to further mechanization pending the construction of additional power stations. India and other agricultural countries made efforts to secure the capital equipment needed for their industrialization.

During the first half of 1949 there was a reduction of government controls but the scarcity of dollars that developed during the summer made it sometimes necessary to arrest and even reverse this tendency. In Great Britain the policy of nationalization continued. Budgetary deficits and disinflationary policies were responsible for further minor increases in taxation.

Dominions producing raw materials continued to enjoy prosperity owing to the demand for their products. The temporary setback in the prices of their staple exports through the business recession in the United States during the first half of the year became reversed as a result of the devaluation of the pound, which resulted in a sharp recovery in the prices of these raw materials. Disturbances in southeastern Asia handicapped economic activity, though order was largely restored in Malaya, Indonesia and French Indo-China. War fears in Europe were generally less acute than in 1948 and consequently this source of uncertainty was no longer such a strong handicap to business expansion on the continent. The increase of the general price levels in Europe following upon devaluation was moderate during the last quarter of 1949. Nor was there any immediate sharp recovery in business activity comparable with that witnessed in many European countries after the depreciation of sterling and a number of continental currencies in 1931. On the other hand, since on this occasion most countries west of the "iron curtain" immediately followed Great Britain in devaluing their currencies, there was no repetition of the experience of the 1930s when resistance to devaluation forced Germany, France, Italy and other countries into deflation which tended to aggravate their business depression. After the devaluation of 1949 there was an all-round moderate improvement of business conditions in western Europe, through the stimulus to exports to the dollar area and the removal of fears that Europe might have to follow the United States in the latter's business recession. The actual increase of production stimulated by the devaluation was moderated by the existence of full or near-full employment already in most western European countries. At the end of 1949 business conditions in Europe presented a totally different picture from that of a year earlier. The abnormal postwar buying of consumers' goods to replace those used up or destroyed during World War II, which was a prominent feature of the previous postwar years, came to an end. On the other hand, normal current purchases were running at a sufficiently high level to keep industry fully engaged.

(End.)

**United States.** In the United States 1949 was characterized by some downward adjustment from the record business activity and the near-capacity utilization of plants and facilities of 1948. The buyers' strike, chiefly by business men, which struck a whole series of industries in the last quarter of 1948 as prices dropped, spread during the first half of 1949. Business buyers, fearful that prices would drop drastically, reduced orders and scrambled to get rid of inventories. This cautious policy was reflected in a substantial drop in industrial production and employment and both reflected and contributed to the continued decline in wholesale and retail prices. By mid-1949 production was down by 30 to 50% in some plants. Heavy unemployment appeared in mill towns of New England and the south, in shoe centres, and in areas where furniture and metal products were made.

Reduction in spending by business firms and other producers resulted in lower sales and output of heavy equipment.
Heavy industries in 1949, however, did almost twice the prewar volume of business. In response to the impact of deflationary forces and the general business uncertainty which prevailed during the first half of the year, the board of governors of the Federal Reserve system reduced reserve requirements of member banks twice during the first six months of the year—first early in May and again at the end of June.

On the whole, consumer demand through the first half of 1949 continued high. The dollar volume of retail sales during the first quarter of the year was greater than in 1948 and was only slightly below 1948 during the second quarter. Steady consumer buying ended the hesitant business buying by early autumn and industrial activity expanded in spite of the coal and steel strikes, although production of soft goods and even of metal products continued to rise.

**Personal Income and Expenditures.** Total personal income in 1949 at $211,710 million was only 0.3% of 1948; salaries and wages income at $134,900 million was 1.5% greater than in 1948. Thus, the 7.2% drop in manufacturing pay rolls was more than offset by increases in the distribution and service industries and in government payments. According to the estimates of the Department of Commerce, the increase in total non-agricultural income just offset the drop in agricultural income resulting from sharp declines in prices of farm products. Personal consumption expenditures at the annual rate of around $178,700 million during the first half of the year, were slightly greater than during the first half of 1948. During the third quarter of the year they showed an annual rate of $178,500 million, only slightly below the same period in 1948.

**Employment.** Total civilian employment for the first ten months of the year, as estimated by the Bureau of Labour Statistics, averaged 58.6 million out of a total estimated labour force of 63.5 million. Unemployment for this period averaged only 3.4 million, slightly above the normal frictional unemployment of about 3 million. The average employment of 58.6 million was only 1.1% below employment during the same period of 1948. Manufacturing employment for the year 1949 was 8.5% below 1948 and manufacturing pay rolls were down 7.2%.

**Production.** Industrial production, as measured by the Federal Reserve board index, dropped steadily from January to July, falling from 191 in January to 161 in July, a loss of 15.7%. After July, the index rose fairly steadily to an estimated 174 for December, but total industrial production for 1949 was almost 9% (8.9%) below 1948.

Steel production continued to expand through the first quarter of the year, dropped rapidly from April to July, rose substantially in August and September and dropped to the low point for the year in October when the steel strike closed many of the major plants. Total production for the year, however, was only 8.7% below 1948.

**Prices.** Although price movements during the first half of the year varied greatly by commodity and by marker, the general movement was clearly downward. At retail, food prices moved higher during the second quarter but prices of apparel, house furnishings and domestic fuels moved steadily lower. Primary market prices weakened further during the second quarter. Prices of non-ferrous metals broke drastically in May and June. In less than 90 days zinc prices dropped 47%; lead, 44%; and copper, 33% from their peaks. Prices of scrap steel dropped from $31-50 a ton at the end of March to $19-50 at the end of June. Textile prices declined more than 3% during the second quarter. On June 30, the prices of 28 commodities traded on organized exchanges and spot markets averaged 31% below the level of June 1948 and 37% below the wartime peak in 1947.

For the year 1949, wholesale prices of commodities other than farm and food dropped 2.5% below 1948. Prices received by farmers in 1949 were on the average 12.2% lower than in 1948. Wholesale prices, in general, for the year were 6.1% below 1948. Retail food prices for the year were down 3.8% from 1948 and the cost of living, 1.2%.

**Agricultural Income.** Prices of farm products in 1949, according to estimates of the U.S. Department of Agriculture, were down 12.2% from 1948. However, receipts from farm marketings were down only about 10% for the year, because of the disposal of a slightly larger volume of products.

**Construction.** Construction activity in 1949, as measured by the value of contracts awarded and reported by the F. W. Dodge corporation, was up 7.8% from 1948 with all types of construction contributing to the increase. Residential and public works and utilities contracts were each up slightly more than 12% from 1948. Non-residential contracts were up slightly less than 1% reflecting the decline in the expansion of industrial and commercial building.

During the first five months of the year the number of new houses (excluding farms) whose construction was begun each month was above that of the corresponding month in 1947 and in June, July and August was substantially greater than in the same months of 1948. The 98,000 houses that were begun showed an increase in August of 12% above Aug. 1948.

**Business Profits.** Business profits, after deduction of taxes, dropped from the high level of 1948, but were still considerably higher than in any previous years except 1947 and 1948. Profits after tax deduction for the first quarter of the year were at an annual rate of $17,300 million, but had dropped to $14,700 million in the third quarter. Dividend payments, however, were substantially greater in each of the first three quarters of 1949 than in the corresponding quarters of 1948, reflecting a more liberal dividend policy on the part of business men as the need for re-investment funds for expansion tapered off. Undistributed profits were reduced about 50% as compared with 1948. Corporate tax liability dropped with the decline in profits, being at the annual rate of about $9,500 million. Corporate profits after deduction of taxes were 23-6% below 1948 according to reports of the Federal Reserve board.

**Banking.** Of importance to domestic economy in 1949 were the continued large deposits and currency held by individuals. In January, the amount of such deposits and currency amounted to $168,200 million, only $2,000 million below Jan. 1948. By August the amount had dropped to $166,900 million, $200 million more than in Aug. 1948. During the first seven months of the year, currency outside banks remained substantially unchanged at about $25,000 million; adjusted demand deposits fluctuated between $81,000 million and $85,000 million; and time deposits between $57,600 million and $58,400 million. Loans of all banks on March 30, 1949 had risen to $48,220 million, an increase of $50 million from the amount outstanding on Dec. 31, 1948, and on Sept. 28 the amount stood at $48,050 million. Commercial bank loans reached $42,370 million on March 30 and stood at $41,780 million on Sept. 28, according to reports of the board of governors of the Federal Reserve system. The use of bank credit by business continued to expand throughout 1949.

**Exports and Imports.** Merchandise exports, including re-exports and civilian supplies for occupied areas, increased during April and May after a sharp fall in February, but dropped sharply in July and eased further in August. Imports during the first eight months of the year dropped continuously with the exception of a slight rise in March. For the year 1949 exports were down 6.1% from 1948 and imports 7.5%.

**Labour Relations.** During the first half of 1949 there were about 2,000 work stoppages due to labour-management disputes, a 10% increase over the Jan.-June 1948 period.
In terms of idleness, however, the estimated total for the first six months of 1949 was only about two-thirds as great as in the comparable periods of the two preceding years. Only 13 stoppages during this six-months period involved 10,000 or more workers. The fourth round of wage increases tended to be smaller than in previous years. Negotiations during the year resulted in an increase of 1 4% in the weekly earning of production workers in spite of a drop of 2 2% in hours worked per week. (See also BANKING; EMPLOYMENT; NATIONALIZATION; STOCKS AND SHARES; STRIKES AND Lockouts; TAXATION.)

CABINET MEMBERS. The following is a list of cabinet members of Great Britain and the dominions on Dec. 31, 1949.

### Great Britain

CAIRO, the capital of Egypt, lying across the Nile north and west of the Mokattam hills; the largest city in Africa, the largest Arab-speaking city in the world and the greatest cultural centre of Islam. Area: c. 8 sq. mi. Pop. (1947 est.): 2,100,500.

On May 31, 1949, a bill establishing a Cairo municipality was passed by the Egyptian Chamber of Deputies. By it a municipal council was set up consisting of the governor of Cairo as president, one elected member for each two of the Cairo constituencies represented in the Chamber, four members appointed by the council of ministers and a number of ex-officio members. Residence and other qualifications for electors were such as to exclude foreigners. The council is responsible for controlling the execution of the Cairo Municipality law, as well as the laws concerning hygiene, public order, buildings and public institutions, for discussing and approving the city budget, controlling the municipal revenues and operating the public services. The revenues of the municipality consist of taxes on buildings and certain other taxes. The municipality is under the supervision of the minister of public works, and the government is entitled in special circumstances to dissolve it and replace it by an administrative body formed by the minister.

There was a further increase in building during the year. Political conditions proved a deterrent to tourists: but an international tennis tournament was held in the spring and an Agricultural and Industrial Exhibition in April attracted tens of thousands of visitors from all over Egypt. There were seasons of French drama and Italian opera at the Royal Opera house. Overcrowding of Cairo university, which had 17,000 students, was stated by a spokesman in August to be a cause of poor examination results. A plan for a second Cairo university was being studied by the government.

(C. Ho.)

CALCUTTA, the largest city of India and until 1912 the seat of the government of British India, extends over an area of 32 sq. mi. Pop. (1941 census): 2,108,891; with the suburb of Howrah, on the west bank of the Hooghly (Hugli) river, 2,488,183.

In union in the important jute industry and a continued rise in the cost of living marked the economic life of Calcutta in 1949. Nevertheless, industrial unrest was not so prevalent as in the previous year. Political anxiety derived from evidence that the provincial government in office was losing some of its support, a portent being the defeat of the government candidate in the south Calcutta by-election. After a visit in August of Pandit Nehru, whose presence did much to improve people's spirits, it was decided that a provincial election should be held in the spring of 1950 and that meantime the government of Dr. B. C. Roy would remain in office.

In municipal affairs, Calcutta was fortunate since the administrative officer, S. N. Ray, effected reforms which greatly heartened those who were jealous for the good name of Calcutta's civic life. The police, too, under S. N. Chatterjee, maintained law and order to general satisfaction. Relations between all communities were good and in particular British residents enjoyed a goodwill which had not been displayed to them for a long time.

Plans for the future included a scheme for an electric underground railway and also the construction of a ship canal from Diamond harbour to Kidderpore docks to eliminate the 42 mi. of dangerous and difficult river navigation on that stretch of the Hooghly and to provide a deep water approach to Calcutta. The port reached the record figure of 760,000 d.w. tons in April as against the normal monthly average of from 550,000 to 600,000 d.w. tons. (E. Hd.)

CAMBODIA: see French Union.

CAMBRIDGE UNIVERSITY. The academic year 1948-49 opened with the following numbers, the figures in parentheses showing the corresponding totals for 1938. The men's colleges had 5,504 (4,849) undergraduates, 1,206 (483) B.A.s, 376 (159) research students, and 1,551 (1,392) M.A.s. In the women's colleges there were 535 undergraduates, 100 fourth year and research students, and 309 M.A.s.

During 1949 the colleges were able to accept only one-twelfth of the applicants for admission. Most sets of rooms held two occupants but despite this, lodgings in the town were still difficult to obtain. The university authorities anticipated that this difficulty would be more serious in future, and to meet the situation, Christ's, King's, St. Catherine's and Newnham colleges started erecting new buildings, which rapidly neared completion.

H.M. the Queen inaugurated the new status of the women's colleges and was given an honorary degree, thus becoming
the first woman graduate. The Cambridge Training college for women received full university status, becoming as Hugh's Hall a recognized institution for women, with 70 students in statu pupiliarum.

New engineering laboratories on Coe Fen were formally opened by the chancellor. A farm was acquired for the new veterinary school, and also a site for a new building for nuclear physics in Madingley road. In his annual address the vice chancellor stated that sufficient land now belonged to the university and colleges to supply all foreseeable needs for many generations.

The following received honorary doctorates during 1949: C. H. Dodd, emeritus professor of divinity; J. de la Morandière, doyen de la faculté de droit de Paris; Lillian Margery Penson, vice chancellor of London university; N. H. Baynes, emeritus professor of Byzantine history, London; G. Müller, professor of modern German, Bonn; Dame Myra Hess.

The following resignations occurred during the year: Miss K. T. Butler (mistress of Girton); A. F. Schofield (university librarian); Professor F. Debenham (geography); Professor C. H. Dodd (divinity); Professor A. C. Chibnall (biochemistry); and Professor G. F. Webb (fine art).

Amongst the losses by death were: T. Thornely (Trinity Hall), the oldest Cambridge resident; W. F. Redaway (King's), late censor of Fitzwilliam Hall, an authority on Scandinavian and Polish history; Dr. F. H. A. Marshall (Christ's), author of Physiology of Reproduction, who left funds to found a chair on the subject; Sir Rowland Biften (Emmanuel), the agricultural botanist, who left funds to Fitzwilliam museum for water colours; G. T. Lapsley, formerly lecturer on constitutional history; S. A. Cook (Caius), emeritus professor of Hebrew and author of many biblical books.

*1938 est., † Including 228,307 sq. mi of fresh water.

The population of Canada was estimated in mid-1949 at 13,636,000 and that of Newfoundland and Labrador (1947) at 315,643; the total population of the dominion, after the incorporation of Newfoundland was estimated in mid-1949 at 13,545,000. Over two-thirds of this population is concentrated in one-tenth of the total area of the dominion (southern parts of Ontario and Quebec, New Brunswick, Nova Scotia and Prince Edward Island). Canada's births in 1948 totalled 347,222, according to preliminary figures, which was equivalent to a birth rate of 27.0 as compared with 28.6 in 1947. The natural increase in 1948 was 227,870. Languages (1941): English (49.7%), French (30.3%), German (4%), Ukrainian (2.6%), Scandinavian (2.1%), Dutch (1.9%), Hebrew or Yiddish (1.5%), Polish (1.5%), others (6.2%).

Religions (1941): Roman Catholic 4,800,895; United Church of Canada 2,204,875; Church of England, 1,751,188; Presbyterian, 829,147; Baptist, 483,592; Lutheran, 401,153; Greek Catholic, 185,657; Greek Orthodox, 139,629; Jewish, 168,367; others, 542,152. Chief towns: Ottawa (q.v.) (cap., pop., 1948 est., 190,465); Montreal (pop., 1948 est., 1,096,060); Toronto (pop., 1947 est., 695,302); Vancouver (pop., 1947 est., 354,150); Winnipeg (pop., 1947 est., 234,201); Quebec (pop., 1947 est., 194,639). Governor-general, Viscount Alexander of Tunis; prime minister, Louis Stephen St. Laurent (q.v.); secretary of state for external affairs, Lester Bowles Pearson (q.v.).

**History.** In 1949 Canada welcomed Newfoundland into confederation, as her tenth province. The union, agreed on Dec. 11, 1948, was effected on March 31, 1949, to the accompaniment of greater enthusiasm in Ottawa than in St. John's. Although some Newfoundlanders conceded that confederation had brought benefits to their island in the way of social services, dissatisfaction with the economic terms of union was expressed by W. J. Browne, Progressive-Conservative member for St. John's West, on Sept. 21, in the first formal address to be made by a Newfoundland member in the Canadian House of Commons.

The Liberal party, which had governed Canada since 1935, was returned to power with the largest majority in its history, in the federal general election on June 27, under the leadership of Louis St. Laurent, a distinguished French-Canadian barrister, who had succeeded W. L. Mackenzie King as prime minister seven months before. (See Elections.)

It was natural that St. Laurent should seek to remove what some had felt were legal ambiguities surrounding the Canadian constitution. Under his leadership, the House of Commons adopted two important constitutional changes. First, it voted to abolish Canadian appeals to the judicial committee of the Privy Council in London, thereby constituting the Supreme Court of Canada as the court of last resort in the dominion. Secondly, the Canadian parliament voted itself powers to amend the dominion's constitution in respect of matters within federal jurisdiction. Both measures were supported by that influential Canadian school of thought which favoured a strong centralized federal government at Ottawa. They were opposed by George Drew, a Canadian air ace of World War I and a former Progressive-Conservative premier of Ontario, leader of the opposition. Drew championed the rights of the provinces in the Canadian constitution, as being a guarantee of protection for the individual citizen against a too powerful federal authority. The third party in the House of Commons—the Co-operative Commonwealth (Labour) federation—secured the adoption of a provision that there should be a session of the parliament at least once each year and that no House of Commons should continue for more than five years. St. Laurent accepted this, with the reservation that "in time of real or apprehended war, invasion or insurrection" a House of Commons might be prolonged.

Canada moved towards closer integration of her defence preparations with those of the United States. It was revealed that the two countries had adopted the same communications systems, battle procedure and battle orders and were working towards full standardization of weapons. They were
co-operating in military research. The prime minister indicated on Oct. 20 that his government saw little immediate danger of war.

An important development in Canadian labour history was the expulsion of Communist elements from national labour organizations. The Trades and Labour Congress of Canada, convened in Calgary on Sept. 15, adopted resolutions recommending that affiliates should expel all known Communists by constitutional procedure. The Canadian Congress of Labour, meeting in Ottawa on Oct. 3, sustained by an overwhelming vote the suspension by their executive of five officers of the Communist-tinged United Electrical Workers' union.

Although the average Canadian experienced a sharp increase in the cost of living during the year, employment was, generally speaking, maintained at a high level. In the week ending June 4 total employment in Canada was 5,018,000, comprising 3,918,000 males and 1,100,000 females. Total Canadian labour income for the first six months of 1949 was $3,687 million, which represented an increase of approximately 10% over 1948.

Devaluation and Trade. Canada's dollar was often described as a sort of half-way house between the pound sterling and the American dollar. It was only to be expected that a major change in the value of sterling would be followed by some sympathetic adjustment of the Canadian exchange rate. Sir Stafford Cripps announced devaluation of the pound sterling in a broadcast on the evening of Sunday, Sept. 18.

On the following night Canada devalued her dollar by 10%. Commenting on Britain's action, Douglas Abbott, Canadian minister of finance, said: "The action which the United Kingdom has taken constitutes a courageous and positive effort by the British people to do their part in the common endeavours that are necessary to provide a basis for a real and enduring recovery of world trade."

Canada's dollar position vis-à-vis the United States showed some improvement during the year but the contraction of her traditional British market for foodstuffs and raw materials threatened to precipitate a grave situation. Under these circumstances, the Canadian government took measures designed to provide Britain with the means of payment for Canadian goods through increasing Canada's purchases of British products. Speaking in Montreal, on Oct. 20, C. D. Howe, minister of trade, said that Canada's chief difficulty was that she bought more from the United States than she sold to that country, and bought less from Britain than she sold to her. If Canada could somehow divert about $400 million worth of annual imports from the United States to the United Kingdom, her trade problem would be solved.

To help increase the sale of British goods in the dominion, a Canadian Dollar-Sterling Trade board was formed in October, being an advisory committee of Canadian industrialists, designed to work in close co-operation with the United Kingdom Dollar Exports board. James S. Duncan, chairman of the Canadian board, stated at a press conference in London on Nov. 4 that Canadian business men considered
it “not easy but not hopeless” to bridge the dollar gap between Britain and Canada by increased British exports.

Even as she faced these trading difficulties, Canada became aware of new potentialities of mineral wealth within her own borders. There were tremendous deposits of high-grade iron ore in Labrador. There was the rapidly-expanding oil development in Alberta, already producing enough petroleum to supply the needs of the three prairie provinces, with proved reserves standing at 1,000 million barrels. There were supplies of uranium, titanium, and base metals. Such resources, it was confidently predicted would reinforce Canada’s economy during the next few critical years.

Miscellaneous. It was announced that Donald Gordon, a member of the Canadian government’s financial brains trust and deputy governor of the Bank of Canada, would become chairman and president of the nationally-owned railway system, the Canadian National railways, as from Jan. 1, 1950. It was the first time in 16 years that the government had reached outside railway ranks for a C.N.R. chief.

With regular flights linking her with British and Australia, Canada emerged as an important air traffic centre. It was recognized that it would probably be several years before a British air line operated from London to the far east through northern Canada but in the meantime agreement was signed on August 2, 1948, the dominion conceded the right to use an airport in northern Manitoba. The first jet-propelled aeronaut landed on the North American continent, the Canadian-designed Avro passed successfully through initial flight tests over Ontario on Aug. 10.

Examining cultural facilities, Canada’s Royal Commission on National Development in the Arts, Letters and Sciences held public hearings in a number of cities.

L. Br.)

Education. With the exception of French-speaking and Roman Catholic Quebec, elementary and secondary education is in the hands of the provincial government. In 1946 State-aided schools in Canada, including primary schools in Quebec, 31,130, pupils 2,039,280, teachers 75,932 Universities (18) and a number of other institutions of higher education, students 157,120 Literacy (1931) 3-8%

Agriculture and Fisheries. Main crops (‘000 metric tons, 1948; 1949 est. in brackets): wheat 10,705 (10,113); oats 5,207 (4,673); barley 3,375 (2,724); hay 644 (251); maize 315; potatoes 2,800 (2,400); turnips 828 (726); rapeseed 322 (253); flaxseed 313 (275); linseed 106 (106); castor beans 265 (265); hemp 225 (225); buckwheat 157 (157); soybeans 62 (62); sorghum 33 (33); sunflower seeds 30 (30). 

Cash income from the sale of farm products (‘000 dollars; 1949; 1948 est. in brackets). Wool, including participation payments 560, other grains 213; potatoes 51; tobacco 38, fruits and vegetables 99; forest products 63; cattle and calves 44; hogs 301; dairy products 389; poultry and eggs 81; and other products 120. Agricultural labour force (June 1949): total 1,123,000; farm operators 667,000; paid workers 154,000; unpaid family workers 307,000.

Food production (‘000 metric tons, 1948; 1949; six months, in brackets): butter 129 (56); cheese 39-2 (18-9); meat 637 (266) of which beef 340 (148) and pork 272 (116); flour 1,907 (284).

Industry. (1946) Industrial establishments 31,249; persons employed 1,058,156, gross value of production 58,036,000, net value $7,467 million. Fuel and power (1948); 1949, six months, in brackets: coal (‘000 metric tons) 15,244 (7,525); lignite 1,440 (741); natural gas (million cu ft) 43,800 (27,585); electricity (million kw-hr) 44,569 (23,462), crude oil (‘000 metric tons) 1,591 (1,262). Raw materials (‘000 metric tons 1948; 1949, six months; in brackets): stone 2,450; iron 5,150; petroleum 1,509; coal 1,123,000; farm operators 667,000; paid workers 154,000; unpaid family workers 307,000.

Clothing 139-2 (145-9); paper products 184-7 (182-6); printing and publishing 163-8 (166-7); petroleum and coal products 193-1 (194-0); chemical products 182-2 (180-9); wood products 155-2 (157-7); iron and steel products 152-9 (155-3); transportation equipment 216-4 (246-1); non-ferrous metals and products 205-0 (213-7); electrical apparatus 260-8 (277-3); non-metallic mineral products 235-4 (242-0).

Canadian labour income (million dollars, 1949); total 7,128; agriculture, logging, fishing, trapping and mining 644; manufacturing 2,426; construction 476; public utilities, transportation, communications, storage, trade 1,853; finance, services (including government) 1,509; supplementary labour income 220. Average weekly salaries and wages in manufacturing (1948): $40-91.

Foreign Trade. Imports: (1948) $2,637 million; (1949, six months) $950 million. Exports: (1948) $3,110 million; (1949, six months) $1,438 million. Main sources of imports (1948): in brackets, 1949: United States 68% (63%); United Kingdom 11% (18%).

Menswear production (1948; in brackets, 1938); United States 49% (48%); United Kingdom 22% (41%). Main commodities imported (1948, in brackets, 1938): machinery and vehicles 20% (15%); petroleum and products 11% (8%); iron, steel and manufactures 9% (9%); coal and products 8% (6%); cotton and manufactures 4% (5%); wool and manufactures 4% (4%); chemicals and allied products 14% (11%). Main commodities exported (1948, in brackets, 1938): newsprint 12% (12%); wheat and wheat flour 12% (13%); wood and manufactures 10% (8%); pulpwood 7% (7%); grain 7% (7%); copper and manufactures 3% (6%); nickel 2% (6%).

CANADIAN LITERATURE. Contemporary themes predominated in the Canadian novels of 1949. Constance Beresford-Howe’s The Invisible Gate portrayed family life in Montreal; Isabelle Hughes’ Time in Ambush did the same for Toronto. Len Peterson’s Chipmunk, a study of maladjustment, and Sol. Allen’s Toronto Doctor also used Toronto settings. Leo P. Walsh discussed the contemporary Canadian attitude to illegitimacy in The Sinful Town.

Other 1949 English-Canadian novel went into the past for their themes and settings. Ethel Wilson’s chief character in Innocent Traveller spanned 100 years, from Victorian England to modern Vancouver; Kathleen Coburn’s The Grandmothers covered nearly the same period, with one lively grandmother in Ontario and the other in Czechoslovakia; Mazo de la Roche’s sentimental Mary Wakefield covered the 1890s in her famous Jalna saga. Other periods appealed to other authors: Charles Terrot went to Nova Scotia in 1755 for his robust Passionate Pilgrim; Harry Symons to the voyage of Columbus for his realistic Three Ships West; Bertram Brooker to Jerusalem for his vigorous portrait of Barrabas, The Robber.

Biography continued to attract writers and there appeared: Tom Cullen of Baltimore, Judith Robinson; Bréal, Immortal Scoundrel, J. H. Cranston; Link to the North (Mickey Ryan
of Arctic fame), G. J. Tranter; Mackenzie King of Canada, H. Reginald Hardy. Personal memoirs prompted three: Nancy Jones, a preacher’s wife, wrote of her life in For Goodness Sake; W. T. Allison recalled a professor’s life in This for Remembrance; Ruth Harvey recalled memories of the old-time theatre in Curtain Time.

The rest of the 1949 non-fiction was extremely varied. A number of personal commentaries were compelling: Robertson Davies was by turns witty and caustic with The Table Talk of Samuel Marchbanks; Hugh MacLennansearchingly examined the Canadian personality in Cross Country; Arthur Meighen restated his political and other speeches in Unrevised and Unrepented; the material for John Fisher Reports and Andy Clark and His Neighbourly News was previously broadcast as 15-min. talks.

French-Canadian. Critics hailed Ringuet’s (the pseudonym of Philips Panneton) Le poêls du jour as his best novel and the leading book of 1949. It covered 50 years of small-town and Montreal city life before and after World War I with lively fidelity. Jean Simard’s Hôtel de la reine was a psychological story with divertingly humorous overtones. Germaine Guévremont’s Marie-Didace was a poetic treatment of typical French-Canadian rural life. Claude Véla portrayed family conflicts solved by faith in Dérive and Claude Surlands went to an old chateau in the Carpathian mountains for love and adventure in La Campanule des Karpathes. Other outstanding novels of the year included André Giroux’s Au delà des visages and G. Moberley’s Diana.

The most significant nonfiction works were Robert Rumilly’s L’autonomie provinciale, a well documented study of provincial rights and autonomy, and Dostaler O’Leary’s Introduction à l’histoire de l’Amérique latine. (See also LITERARY PRIZES.)

CANALS AND INLAND WATERWAYS.

During 1949 the Transport commission published its first report and accounts covering the year 1948. Results were better than anticipated; but operations of the docks and Inland Waterways executive showed deficits for canal tolls and carrying receipts, although the total traffic was higher than in 1947. Acquisition of the remaining railway-owned canals was continued. Improvements, including the modernization of carrying craft, were carried out. Dredging plant was transferred to deepen canals at shallow points and banks and tow-paths were restored to enable full loads to be carried. The pooling of resources speeded up the turn-round of craft.

Additional warehouses were acquired at Worcester and Stourport, but because of the national necessity of restricting capital expenditure and the shortage of labour and materials no major schemes of improvement were started. Authorization was obtained for improvements on the river Severn, and for wall repairs on the river Lee. Disused waterways were surveyed for alternative uses. In March a local committee bought the abandoned Basingstoke canal at a public auction for £6,000. Others were taken over by local bodies, but conversely a narrow boat reached Newbury via the Kennett and Avon canal—the canal’s first use since 1927.

The commission owned or controlled 1,149 carrying craft (about one-sixth of the total operating on British canals) and 2,050 mi. of waterways, 1,000 mi. of which were broad gauge canals and canalized rivers. Through tolls were introduced, but only for each waterway division. Negotiation machinery was reviewed with trades unions, and the constitution of the Joint Industrial council was revised. Arrangements were made with Ministry of Education for a residential hostel at Birmingham for the children of canal boatmen.

The Port of London authority, concerned at rising dredging costs, set up a pilot model of the Thames estuary. The model was to be used experimentally to discover conditions likely to arise in a larger model to be built later embodying the knowledge gained. The larger model, it was hoped, would yield reliable data for practical application.

Internationally inland water transport was studied by an ad hoc working party at Geneva and by the International Chamber of Commerce. They compared the economic factors of the problem of transport co-ordination and recommended a study of true costs, rate structures, potential needs, quality of service, organization and conditions of employment.

Belgium. Plans were drawn up to enable large Rhine-going lighters to proceed in the northern and eastern districts above Ghent, near Antwerp, and in the Brussels district to Clabecq and Liége, financed by the European Recovery programme. Mons, Charleroi, Tournai and La Louvière could only take craft up to 300 tons.

Danube. The first meeting of the International Danube commission, which was set up at the conference in Belgrade, Aug. 1948, was held in Galatz, Rumania, in Nov. 1949. F. Rudenco, Rumania, was elected chairman, and Mr. Linhart (Czechoslovakia), deputy chairman. Mr. Morozov, Soviet Union, was appointed secretary of the commission. The Rumanian government announced its decision to dissolve the Rumanian Danube Steamship company and to transfer its fleet and property to the joint Russian-Rumanian transport undertaking. Great Britain, France and the United States did not attend the meeting. On Nov. 15, they sent notes to the participating nations stating that they did not recognize the commission. The Lanchid, a new chain bridge over the Danube to replace one destroyed in World War II, at Budapest, was re-opened on Nov. 20.

Ireland. The Milne report recommended re-organization of Irish transport with immediate acquisition of the public transport systems including the Grand canal company. Córás Iompair Éireann would be reconstituted and would bear administrative responsibility. A bill to give effect to these recommendations was published in October.

Netherlands. The Dutch inland water fleet numbered 17,100 vessels totalling 5 million tons—its prewar level. Work proceeded on the Amsterdam-Rhine canal for 2,000-ton craft.

Rhine. Navigation was greatly improved during 1949. Craft were able to pass in a two-way direction except in the Cologne area, where only one direction at a time was
CANCER

The first vessel crossing the reconstructed Mittelland aqueduct over the river Weser, near Minden, Germany, Feb. 18, 1949.

permitted. The normal channel depth of 24 m. between Emmerich and Ruhrort was re-established as was the buoyage to enable night navigation. The harbours at Duisburg-Ruhrort were cleared almost to their prewar capacity and much new equipment, including four 200-ton lift floating cranes and nine heavy lift portal cranes of 200-600 tons capacity, was provided. Work on the Rhine-Main-Danube was continued. The Mittelland aqueduct over the river Weser was re-opened on Feb. 18.

Sweden. The Roads and Waterways administration reported on the need in peacetime of the Falsterbo Ship canal, which had been cut across the peninsula of that name during World War II, to pass ships into and out of the Baltic without crossing German minefields. (W. A. F.)

United States. Of the estimated 65,000 mi. of potential inland waterways in the United States, approximately 30,000 mi. had been improved for navigation by commercial and pleasure craft by the end of 1949. All operations and maintenance of the system, which includes 185 harbours and 400 locks, remained the responsibility of the Corps of Engineers, Department of the Army, under the direction of congress.

The River and Harbour act approved on Oct. 13, 1949, provided $1,114,145,690 for the construction of 92 authorized projects in 37 states, including about $995 million for flood control and $119,500,000 for river and harbour projects. An additional $75 million was appropriated for maintenance, operation and care of the nation’s vast network of ports and inland waterways, and $3,200,000 for planning, preliminary examinations and surveys of new projects. In addition, the lower Mississippi river and the Sacramento river in California received separate appropriations of $67 million and $3,600,000 respectively for construction, maintenance and operations.

Among the principal projects on which construction was begun or continued during the year were the McNary lock and dam and the Chief Joseph dam on the Columbia river in the interest of navigation, power development and irrigation; the New York and New Jersey channels; Demopolis lock and dam, on Warrior river, Alabama; Houston ship channel, Texas; the Neches and Angelina rivers and the Sabine-Neches waterway, in Texas; lateral canal and lock project on the Mississippi river at Chain of Rocks, near St. Louis, Missouri; Morgantown dam and lock no. 2, on Monongahela river; Cleveland harbour; Missouri river between its mouth and Sioux City, Iowa; Pearl river, Missippi and Louisiana; San Diego river and Mission bay, California; New Haven harbour, Conn. et al.; Jim Woodruff lock and dam, Apalachicola river, Florida.

According to preliminary estimates, the total net water-borne commerce of the United States, eliminating all known duplications of traffic between rivers and ports, reached the record level of 794,772,987 short tons in the calendar year 1948. Ocean traffic, foreign and coastwise, aggregated 335,253,737 tons.

United States water-borne commerce on the Great Lakes aggregated 118,000 million ton-miles. Inland waterway commerce, excluding the Great Lakes, totalled 40,276,403,000 ton-miles, including the deep sea traffic on the Mississippi river below Baton Rouge, Louisiana. Of this total, the Mississippi river system accounted for 27,859,246,000 ton-miles while the Gulf Intracoastal waterway carried 5,903,341,811 ton-miles. (See also DOCKS AND HARBOURS; FLOODS AND FLOOD CONTROL; PANAMA CANAL ZONE; SUEZ CANAL.)

(C. Hb.)

CANCER. The cause of cancer continued to be intensively studied in 1949. As far as can be judged, it arose from an alteration in the cell, a so-called mutation, which may take place under a variety of conditions, including exposure of the cells to injury or infection, which causes them to grow. W. R. Earle showed that if the cells of normal tissue are cultivated for a long time in an artificial culture medium their biological qualities may be altered so that they can on inoculation produce a malignant growth. His experiments were carried out with animal tissues and with standard methods of tissue culture. Slight irritations produced by exposure to physical agents, such as X-ray or radium, will change the individual cells into a new type of cell which is more or less permanent and ultimately is recognizable as a malignant growth. In other words, the cancer cell is simply a normal cell which under various conditions is so altered in the course of time that it is capable of extending into normal structures and ultimately causing the death of such structures. In animals there are certain types of tumours which differ somewhat from those in human beings and are apparently due to a mutation occurring in the tissues of the breast. John J. Blittner studied cancer of the breast in a strain of mice which was probably caused by the presence of a virus in the tissues. The virus was apparently transmitted by nursing and gave rise to a large number of cases of malignant
breast tumours among healthy animals that were permitted to nurse from an infected strain. The breast tumour tissue contains minute particles which could be demonstrated only under special conditions. These small particles were believed to be a type of virus, as they could be obtained in quantity only by centrifuging at a high speed the fluid obtained from extracts of these breast cancers. The demonstration of these particles was first made by R. D. Pasey and his colleagues in the department of experimental pathology of the University of Leeds, England. The suggestion that human breast cancer may be due to the presence of an organism was much discussed in popular magazines during 1949, but there was no evidence of any such transmission of tumours in human beings.

The treatment of cancer with isotopes produced by the cyclotron was being carried out on a large scale in 1949, chiefly with iodine (I) and phosphorus (P) with or without radiation as an adjuvant. The radioactive iodine was used largely in the treatment of thyroid conditions, either without the application of surgery, or as part of a course of treatment which included surgery. Some clinics gave thouracil at first, followed by radioactive iodine, to reduce the activity of the gland, followed by excision. Others simply gave the radioactive iodine followed by surgery. Mild cases might be sufficiently benefited by the radioactive iodine alone.

Of the blood diseases the only one which seems to be effectively treated is polycythaemia (excess in the number of red corpuscles in the blood). In the leucemias (diseases characterized by excessive production of white corpuscles) reduction of the cells by the administration of radioactive substances was accomplished, but dosage had to be carefully limited because of the destruction of the normal cells of the bone marrow as well as the pathological types. As a rule X-ray was a safer method of treatment of the leucemias, though in expert hands a combination of radioactive material and X-ray seemed to be of benefit.

The use of high voltage X-ray was being studied in 1949, using anode potentials of 1,000,000 volts or more, but, as might be expected, no great biological differences could be detected between the high voltages and the ordinary 200 or 300-kv. X-ray which had become fairly standardized. This was to be expected from the results published by Charles Packard who showed by using a biological object and measuring the output of the machine in an ionization chamber that there are not essential differences in the lethal effect of radiation produced by potentials from 150-kv. to 1,000,000-kv. The only advantage of the higher voltage is that the penetration is somewhat greater and hence can influence deeper tissues, but there was always the danger with such high voltage treatment of excessive damage unless measurements were carefully made. Also the cost of high-energy treatment made it impossible for all but a few research institutes to use it and the tendency was to use radium or one of the radioactive isotopes for local treatment and moderate-voltage X-ray equipment for general therapy, especially of internal cancer. (See also CHEMOTHERAPY; MEDICINE; SURGERY; X-RAY AND RADIOLOGY.)

CANNING INDUSTRY-CANTERBURY.
(For his early life see Britannica Book of the Year 1949.)

In July 1949 in the Church assembly he deprecated the disestablishment of the Church of England, especially during the present period of industrial and social re-organization. He entertained at Lambeth 300 overseas missionaries. In March, in the House of Lords, he demanded an enquiry on artificial insemination. Although cautiously approving the practice where the husband was the donor, he condemned it where this was not the case. He publicly dissociated himself from the political views expressed by the dean of Canterbury. In the autumn he condemned the sale of contraceptives by means of slot machines and announced plans for the support of Church schools in the diocese of Canterbury. In December he visited Malta for the dedication of the Allied war shrine in the Anglican pro-cathedral.

(Rev. W. L. Scott Fleming, who was consecrated bishop of Portsmouth, at Southwark cathedral, Oct. 18, 1949.)

CAPETOWN, the “mother city,” one of the largest ports and the legislative capital of the Union of South Africa. Area: 79 sq. mi. Pop. (Dec. 31, 1948 est.): 402,850 including 194,050 Europeans. Inside the municipal boundaries there were, in 1949, 609 mi. of constructed roads and six independent sewage schemes.

Little was achieved during 1949 with the development of the large area (480 ac.) of reclaimed foreshore. The total cost of this scheme was estimated at £13 million and a committee was investigating how this sum could be raised and apportioned between the government, the South African railways and the city council. When completed, this reclaimed area would contain a new maritime terminal, railway station and administrative offices, hotel and goods depot, a civic centre and extensions to business and shopping districts.

The Table Bay power station was enlarged during 1949 to a capacity of 160,000 kw. Extensions in progress would increase this figure by another 40,000 kw. New industrial areas were developed. On the N'dabeni industrial township 12 new factories were erected and brought into commission. Two other factories nearing completion towards the end of the year. At Epping 60 out of 150 ac. were allotted for industrial sites.

Lack of money meant little progress on housing schemes for Europeans, Eurafri cans or Natives. (W. R. GN.)

CAPE VERDE ISLANDS: see PORTUGESE COLONIAL EMPIRE.

CARIBBEAN COMMISSION. This is an advisory body set up by an agreement in Oct. 1946 between the four countries (France, the Netherlands, the United Kingdom and the United States) responsible for the administration of non-self governing territories in the Caribbean area. Its object is to promote and extend co-operation between these countries and their dependencies in the region in order to promote the social and economic welfare of the inhabitants, to encourage scientific and economic development, to facilitate the utilization of resources and to co-ordinate and facilitate research. The commission is chiefly concerned with directing and co-ordinating the activities of its two auxiliary bodies, the Caribbean Research council and the West Indies conference. It consists of 16 commissioners, four appointed by each of the member governments. It maintains a central secretariat at Port of Spain, Trinidad (secretary general: Lawrence W. Cramer). It meets twice yearly, meetings normally being held in rotation in the territories of the four metropolitan governments. The 8th session of the commission was held in Trinidad in June 1949 and the 9th session was held in the Virgin Islands in December. There was also a working committee which met in Washington in Feb. and Sept. 1949.

The Research council consists of from 7 to 15 members selected by the commission for their special qualifications. In 1949 the commission formed six research committees: agriculture, fish, wildlife and forestry; medicine, public health and nutrition; sociology and education; economics and statistics; engineering; industrial development. The council met in Trinidad in May 1949; 42 recommendations were submitted for the consideration of the commission: these covered all aspects of the research work carried out by the council, more particularly the publication of the Yearbook of Caribbean Research (1949), for which improvements and modifications in future editions were suggested. The research committee on agriculture, fish, wildlife and forestry held its inaugural meeting in Trinidad in July. Other publications were The Tobacco Trade of the Caribbean, The Dairy Products Trade of the Caribbean, and the Report of the Third Session of the West Indian Conference.

The commission continued the publication (in English, French, Dutch and Spanish) of the monthly bulletin containing reports of its activities, news of important developments in the dependent territories of the Caribbean, notes of Caribbean interest and articles. It inaugurated the publication of Economic Information leaflets, the initial issues being devoted to information on potential and existing sources of capital for Caribbean economic development. Plans were also made for the publication of a Caribbean Review.

Among other activities in 1949 for which the commission was responsible or which it sponsored were: the inauguration in January, in collaboration with the agricultural departments of the various territorial governments, of a Plant and Animal Quatrine Reporting service; the collection and
CARMONA, ANTONIO OSCAR DE FRA-GOSO, Portuguese army officer and statesman (b. Lisbon, Nov. 24, 1869). He followed an army career as a cavalry officer and was a general when first brought into contact with politics as a member of the non-party cabinet of António Maria da Silva, that held office for five weeks in Nov.-Dec. 1923. He was state prosecutor (da Silva being again premier) in the famous trial in Sept. 1925 of officers that were responsible for the abortive risings in April and July of that year and had turned it instead into an effective indictment of the parliamentary regime. Their acquittal precluded the events of the following year. After the military coup d'état of May 28, 1926, Carmona became a member of the governing triumvirate and minister of foreign affairs, then premier and minister of war after which—still in 1926—he assumed interim presidency by decree, continuing to hold the premiership till Aug. 27. Confirmed as president by the plebiscite of March 25, 1928, for five years (prolonged to seven in 1933 in accordance with constitution of that year), he was re-elected in 1935, 1942 (having first announced his intention of withdrawing from public life) and on Feb. 13, 1949, when he obtained 941,863 votes against General Norton de Mattos's 4,789. He paid a state visit in 1929 to Spain, in 1938 to São Thome, Principe and Angola (first ever paid by a head of the Portuguese state to any part of the empire) and in 1939, shortly before the outbreak of World War II, to Mozambique and the Union of South Africa (first ever paid to the Union by the head of any European state). On May 28, 1947, he was raised to the rank of first Marshal of Portugal. He was created a Lieutenant General of the Spanish army by General Franco in Oct. 1949.

CENTENARIES. The year 1949 saw the centenaries of many events in English history. Thirty-two Danes rowed from Frederikshund in a reconstructed Viking ship “Hugin” and landed at Broadstairs on July 28, 1949, near the place of the landing of Hengist and Horsa in 449. The “Hugin” was rowed to London where the Vikings were accorded civic welcome, and later the boat was purchased by the Daily Mail (London) and toured many seaside resorts.

The 300th anniversary of the execution of King Charles I on Jan. 30, 1649, was kept by the Royal Stuart society. The Roman Catholic diocese of Plymouth held a three-week commemorative period in June 1949 to recall the rising in Devon and Cornwall in 1549 against the reform of the church services. Robert Kett’s rebellion of 1549 was recorded by an exhibition held in the Castle museum, Norwich.

The 400th anniversary of the first authorization of the English Book of Common Prayer was celebrated on June 19 in parish churches throughout the country. An exhibition was held in the bible room at the British museum. The earliest edition of the book was dated March 7, 1549, and it was ordered to be used exclusively in churches on and after Whitsunday, June 9, of the same year. Other ecclesiastical centenaries included the founding in 1249 of St. Augustine’s church, Brookland, Kent.

The market town of Tenterden, Kent, was annexed to Rye and added to the Cinque Ports as a corporate body in 1449. On June 28, the same year, the first civic charter was granted to Nottingham. Both towns held celebrations to mark their quincentenaries, and Nottingham published a short history Nottingham Through Five Hundred Years. Maidstone, 20 mi. distant from Tenterden, held a week of civic pageantry from July 2 to 9 to celebrate the granting of the town’s first charter of incorporation by King Edward VI on July 4, 1549. Oldham, Lancashire, and Tynemouth, Northumberland, both celebrated the 100th anniversaries of their charters.

University college, Oxford, on July 1, 1949, celebrated the septennial of the death of its founder, William of Durham, whose bequest of 310 marks to the university for the maintenance of 10, 11 or 12 masters was the origin of the college’s continuous history. St. Columba’s college, Rathfarnham, county Durham, celebrated its centenary on its present site. The school was founded in 1843 by William Sewell and in 1849 was moved from its home beside the river Boyne. St. John’s college, Hurstpierpoint, was also founded in 1849—by Nathaniel Woodard.

Queen’s university, Belfast, celebrated the centenary of its opening when, in Nov. 1849, 90 matriculated students...
attended the first lectures of Queen's college. A procession and special exhibition were held in Oxford on April 20 to mark the bicentenary of the opening of the Radcliffe Camera, which had been built after a gift of £40,000 by Dr. John Radcliffe.

The founding of Bedford college for women, London, by Elisabeth Jesser Reid in 1849 was commemorated in May 1949 by celebrations which included a visit by Queen Mary.

The centenary of the death of Fryderyk Chopin on Oct. 17, 1849, was recalled by many memorial lectures and concerts. Other centenaries were Johan August Strindberg (b. Jan. 22, 1849), Ivan Petrovich Pavlov (b. Sept. 26, 1849) and Edgar Allan Poe (d. Oct. 7, 1849).

Celebrations were held in university towns in Germany on Aug. 28, 1949, to mark the bicentenary of the birth of Johann Wolfgang von Goethe. At Frankfurt, his birthplace, and at Weimar, in the Soviet zone, the celebrations were on a large scale.

Whitsunday, June 3, 1949, was the occasion of the celebrations of the centenary of the Danish parliament's commitment to Christianity by Frederik VII. The day closed with thousands of students carrying flaming torches outside Christiansborg castle, the official residence of the King and the seat of the Danish houses of parliament. Spokesmen from Greenland, Faeroe Islands, Norway, Sweden, Finland, Iceland and Great Britain brought greetings.

Although the actual date of the birth of Confucius has always been in doubt, the Chinese Nationalist government decreed that the 2,000th anniversary of his birth should be celebrated on Aug. 28, 1949.

Halifax, Nova Scotia, celebrated its bicentenary in September, and La Paz, Bolivia, its quadracentenary. (X.)

CEREALS: see GRAIN CROPS.

CEYLON, DOMINION OF. A self-governing member of the Commonwealth of Nations, lying off the southern extremity of India and approaching to within 6° of the equator. Area: 25,322 sq. mi. Pop.: (March 19, 1946 census) 6,693,945, (mid-1949 est.) 7,288,000. Languages: mainly Sinhalese (69%) and Tamil (21%). Religions: Buddhist (61%); Hindu (22%); Moslem (9%) and Christian, mainly Roman Catholic (7%). Chief towns (1946 census): Colombo (cap., 362,000); Jaffna (63,000); Dehiwala-Mt. Lavinia (56,000); Kandy (52,000). Governor-general, Sir Henry Monck-Mason Moore and, from July 6, Lord Soulbury; prime minister and minister of defence, Don Stephan Senanayake (q.v.).

History. The prime minister received many congratulations on Feb. 4, 1949, the first anniversary of Ceylon's independence. Internationally Ceylon was set back by the Soviet veto of its claim to membership of the United Nations. Its government on Dec. 23, 1948, announced their refusal of harbour or airfield facilities to Dutch ships or aircraft carrying troops or war materials to Indonesia; the ban was lifted on July 19. Early in the year S. W. R. D. Bandaranaike, on a visit to New Delhi, suggested that India, Pakistan, Burma and Malaya should make regional arrangements for mutual defence under the United Nations charter. In April, D. S. Senanayake attended a meeting of Commonwealth prime ministers in London. On his return he revealed that the British government agreed to help in the organization of Ceylon's defence forces. In September the Earl of Caithness, who on May 10 had been appointed military adviser, became the first commander in chief of Ceylon's forces. Lord Soulbury assumed the governor-generalship on July 6 in succession to Sir Henry Monck-Mason Moore who had departed a few weeks earlier, the administration in the interim being in the hands of the chief justice, Sir Arthur Wijayewardene.

Ceylon kept in step with India in devaluing her rupee so as to maintain the sterling parity of 1s. 6d. The relationship between the Ceylon and the Indian rupee, however, was severed by the parliament at Colombo on Sept. 20. A new agreement was made between the British government and the government of Ceylon on the use of Ceylon's sterling balances for a further year to June 30, 1950. The agreement sanctioned the release of sterling to the extent of £7 million and at the same time Ceylon was able to retain, from her surplus dollar earnings, an independent reserve to be held by the Reserve Bank of Ceylon when created. This agreement was recognized in Ceylon as generous; indeed it involved the doubling of the release of sterling allowed in the previous agreement. In order to control Ceylon's foreign expenditure and increase home production, a cabinet committee was appointed on Aug. 22 to draw up a programme to keep imports within available exchange resources and implement the decisions to save dollars taken at the conference of Commonwealth finance ministers in London.

The budget presented on July 14 provided for reduced current charges from Rs.13 million in the previous year, and increased income tax in the lower group of incomes. The minister of finance, J. R. Jayawardene, forecast an adverse balance of Rs.190 million (£14,250,000) and consequently measures of control to reduce the gap. A local loan of Rs.400 million was to be raised; but considerable foreign capital would be required for productive development. There was no intention of placing restrictions on the withdrawal of foreign capital investments; and profits earned by such investments could be remitted to the country of origin.

The contract for the construction of an irrigation project in the Galoya area designed to irrigate about 100,000 ac. of land in the eastern province was given to a U.S. firm by the government, the engineer in charge being a former member of the constructional staff of the Boulder Dam. The former financial secretary of Ceylon, H. H. Huxham, came out of retirement in England to become chairman of the Galoya Development board, under the authority of which the project would be carried out.

During the year Ceylon expanded her diplomatic relations with neighbouring countries, particularly Burma with which an interchange of ambassadors took place in acknowledgment of the close religious ties existing between the two countries as staunch adherents of Buddhism. Ceylon established relationships also with India, Pakistan and Japan. The British Ministry of Health granted 20 scholarships to Ceylon doctors to enable them to go to Britain for specialized study and training. The Sinhalese already had a high reputation in the medical profession and supplied doctors to such neighbouring countries as Malaya and India.

After an interval of 11 years, pearl fishing was resumed in Tambelegam bay, Trincomalee. Pearl fishing had been at one time an important industry in Ceylon but had dwindled away. A sugar expert was lent to the government of Ceylon by the government of India to advise on the proposed establishment of a sugar factory at Galoya where about 36,000 ac. had been earmarked to grow sugar cane. An ilmenite factory was to be set up at Pulmoddai, 40 mi. north of Trincomalee, at a site said to be one of the best in the world for ilmenite sands.

Work was begun on the restoration of the historic 2,000-year-old stupa, built on the spot from which Buddha is said to have preached on his visit to Ceylon 2,500 years ago. A new protective shelter for the colossal image of the Buddha at Avukana, among the finest of its kind in Asia, was to be provided by the Archaeological department. The Colombo museum received from the university of Edinburgh, the skull of Kappetipola Dissawa, the leader of the Kandyian rebellion of 1818, who was executed after capture by the British forces
in that year. His skull had been removed to Britain and deposited in the anatomy department of Edinburgh university.

(E. H.D.) Education. (1947) Schools: government and assisted 5,436, pupils 843,017; English 461, pupils 1,827; industrial 666. Institutions of higher education 2, students 2,969. Illiteracy (1948) 35%.

Agriculture. Main crops ('000 metric tons, 1948; 1949, six months, in brackets): tea 136 (70); rubber 96 (42), rose 251. Fresh coconuts (exports in thousands, 1948) 9,387. Livestock (in '000 head, 1946-47): cattle 1,116; sheep 55; goats 326; buffaloes 624. Fisheries: total catch (1946): 22,000 tons

Industry. Chief mineral product is graphite; exports ('000 metric tons, 1948) 14,000. Salt production amounts to about 30,000 tons a year.

Foreign Trade. (Million rupees) Imports: (1948) 994, (1949, six months) 566. Exports (1948) 1,011, (1949, six months) 493

Finance and Banking. (Million rupees) Budget: (1948-49 est.) revenue 565 0, expenditure 532 6; (1949-50 est.) revenue 563 7, expenditure 565 5. National debt (Sept. 30, 1947) 469. Note circula-

CHAD: see French Union.

CHAMBERS OF COMMERCE. The vital problem of balancing the external trade account of the United Kingdom, and of closing its dollar deficit in particular, caused considerable attention to be given in 1949 by chambers of commerce to export trade problems. The Association of British Chambers of Commerce and its constituent chambers assisted in meeting the problems of overseas trade; in so doing they dealt with subjects involving national policy; e.g., the liberalization of intra-European trade, the European Recovery programme and the international tariff negotiations conducted at Annecy, France, as well as with the difficulties of individual exporters and would-be exporters. The problem of trade with North America gave birth to two new organizations of business men, in both of which the Association of British Chambers of Commerce played a leading part. Discussions with the Canadian Chamber of Commerce led to the formation of the United Kingdom-Canada Trade committee. This body, sponsored by the Canadian Chamber and by the A.B.C.C., Federation of British Industries, National Union of Manufacturers and National Farmers' union, arranged to meet twice each year to review trade problems at the business level, concerning itself with United Kingdom imports from Canada as well as exports to that dominion. The second new body, the Dollar Exports board, was formed in May; the problem of increasing sales to dollar markets represented its broad terms of reference. The president of the A.B.C.C., John McLean, was appointed chairman of the United Kingdom section of the committee working with the Canadians; he was also appointed a member of the Dollar Exports board.

During 1949 the A.B.C.C. again advised the Board of Trade on the problem of frustrated exports. By the end of the year advice had been given on more than 4,000 applications, mostly concerning textiles, from firms wishing to sell on the home market goods originally made for overseas but for which a market had not been found.

Jointly with the F.B.I. and the N.U.M., the A.B.C.C. had new talks with the chancellor of the exchequer prior to the expiry on March 11 of the undertaking made in 1948 respecting the limitation of dividends. The chancellor accepted assurances given and did not introduce proposals to limit dividend distribution by statute. With regard to taxation the A.B.C.C. submitted recommendations to the chancellor for consideration before the budget.

The association considered that the chamber of commerce organization ought to issue its views on Britain's economic position and policy. Its statement dealt with the salient features in national policy; e.g., high government expenditure and taxation and the need for incentives, and was submitted to the government. In the autumn the depreciation of the exchange rate of the pound created many new problems to be studied by chambers of commerce.

The association convened a conference of representatives from many blitzed cities and towns with reconstruction problems; this led to representations to the government on several important points and a committee was formed to keep matters under constant review. Recognizing the value to business men of expert guidance on the far-reaching and complex Town and Country Planning act, the association published a book on the act, entitled Development and Compensation. The association and its 100 chambers examined carefully all new parliamentary bills of interest to their members, and took steps to secure desirable changes. The Iron and Steel bill received meticulous examination from the point of view of manufacturers and dealers.

The membership of chambers of commerce affiliated to the A.B.C.C. again rose appreciably. Membership of home chambers passed the 60,000 mark and that of affiliated chambers in foreign countries exceeded 8,000. (A. R. K.)

International. The International Chamber of Commerce held its biennial congress, attended by more than 500 delegates, in June 1949 in Quebec, Canada. The Quebec congress reviewed work done during the preceding two years by national committees working in conjunction with working committees of the chamber. Among the subjects to which the chamber had recently given special attention was the formation of a Code of Fair Treatment for Foreign Investments. The problem of foreign investments, especially in underdeveloped countries, had received special attention after World War II and early in 1949 was emphasized in President Truman's Fourth Point, which was to encourage the investment of American capital in other countries, partly for world development and the general raising of standards of living and partly to counterbalance to some extent the American export surplus. On the basis that the first essential for the encouragement of foreign investments was to build assurances for security, for the unrestricted repatriation of dividends, for reasonable scope for development of the project and for the ultimate return of the capital in the currency of the lender, the International chamber's Code of Fair Treatment was drawn up, and it received much attention in the United Nations Economic and Social council and in the treasuries of a number of leading governments.

An important branch of the chamber's work was the furtherance of double taxation agreements, and a number of new agreements were concluded during 1949.

A part of the chamber's activity which attracted much attention was its work for the removal of barriers to trade and travel. Special study was given to this subject, which had great, though indirect, influence on the development of foreign trade. The chamber issued three brochures, one dealing with barriers to international travel, especially the simplification of arrangements for passports and visas and frontier formalities; another dealing with barriers to the transport of goods, covering consular invoices, transit manifests and the like and pressing for a reduction of the large number of documents required; and a third on invisible barriers to trade, dealing with standardization and simplification of customs procedure, agreed bases of ad valorem valuations, marks of origin and so on. (C. G. F.)
CHANNEL ISLANDS. A group of islands in the English channel, of which the largest are Jersey, Guernsey, Alderney and Sark, forming part of the United Kingdom, but administered independently. Area: 75 sq. mi. Pop. (1946) 92,467. Capitals: Guernsey, St. Peter Port; Jersey, St. Helier. Lieutenant governor of Jersey, Lieutenant General Sir Arthur Grasett; lieutenant governor of Guernsey, Lieutenant General Sir Philip Neame.

In June 1949 the Duke and Duchess of Edinburgh, accompanied by the home secretary, James Chuter Ede, visited Alderney, Guernsey, Sark, where the Duke opened a new harbour, and Jersey.

The 600 yr. old dispute between Great Britain and France concerning the Minquiers and the Ecrehos islands was considered in the Jersey States in March, and it was proposed that the dispute be referred to the International Court of Justice. Fear of the Colorado beetle caused the international executive committee on the Colorado beetle to visit Jersey.

During 1949 the Guernsey States and the Jersey States agreed to introduce national service for 18-year-old youths. The first States of Alderney was opened on Feb. 18 by the home secretary. In May it was decided to impose a landing tax on visitors, and on May 18 the first telephone exchange was opened. The meeting of the Sark Chief Pleas on Sept. 13 was notable when all elections for people's deputies since 1925 were declared to have been illegal. Alterations to the regulations were made in 1925, but under an Order in Council of June 20, 1922, these should have been submitted to the Privy Council. Elections for new deputies were held on Oct. 1. The committee of the Privy Council on the island of Alderney, which had been appointed in 1947, published its report in November. (X.)

BIBLIOGRAPHY. V. V. Courtwald, Isolated Islands (St. Peter Port 1948).

CHARLES (Charles - Théodore - Henri - Antoine - Meinrad de Saxe-Coburg, Count of Flanders), prince of Belgium (b. Brussels, Oct. 10, 1903), younger brother of King Leopold III (q.v.), was appointed regent by a joint vote of the parliamentary chambers on Sept. 20, 1944. (For his early life see Britannica Book of the Year 1949.)

In 1949, as in previous years, he was not often seen in public and his role was limited to helping in the formation of successive governments. On April 25, in Berne, King Leopold met his brother in the presence of Paul-Henri Spaak, the prime minister, and Henry Moreau de Melen, minister of justice, with a view to examining the "royal question."

CHARLOTTE (Charlotte-Aldegonde-Elise-Marie-Wilhelmine), Grand Duchess of Luxembourg, Duchess of Nassau, princess of Bourbon-Parma, etc. (b. Berg castle, Luxembourg, Jan. 23, 1896), succeeded her sister Marie-Adelaide after her abdication on Jan. 15, 1919. On Nov. 6, 1919, the grand duchess married Prince Felix-Marie-Vincent of Bourbon-Parma. They had six children, the eldest being Grand Duke Jean (b. Berg castle, Jan. 5, 1921). On the invasion of Luxembourg by Germany on May 10, 1940, the grand duchess and her family moved with the government first to Paris and then to Lisbon. In August the grand duchess followed Joseph Bech (q.v.), minister of foreign affairs, to London, sending her family to Montreal. Grand Duke Jean, the heir apparent, joined the Irish Guards and landed in France with the Allied armies; and the prince consort became a brigadier in the British army. After the liberation of Luxembourg the grand duchess returned to the capital on April 14, 1945. The 30th anniversary of her reign was celebrated on Jan. 23, 1949, her birthday.

CHEESE: see DAIRY FARMING.

CHEMISTRY. Names of Elements. The International Union of Pure and Applied Chemistry, at its meeting in Amsterdam in Sept. 1949, recommended these names of elements:

Astatine is the halogen beyond iodine, francium the alkali metal beyond cesium, and promethium is the element in the group of rare earths which was originally called illinium. The recommendation of niobium to replace columbium and wolfram to replace tungsten represented the widest divergence from American usage, although the symbol W for tungsten had always been used.

Uranium. During 1949, work by Kurt Kraus, Frederick Nelson and Gordon Johnson of Oak Ridge National laboratory, Tennessee, dealt with the chemistry of pentavalent uranium (or uranium (II)) solutions. I. M. Kolthoff showed in 1945 that solutions of ordinary uranium (III) compounds could be reduced to uranium (II) at the dropping mercury electrode but he regarded the latter as a transient species which rapidly underwent disproportionation into the +4 and +6 oxidation states.

The Oak Ridge investigators found that solutions of uranium (II) compounds could be preserved without appreciable decomposition for considerable periods of time if maintained in the optimum stability range between pH 2 to 4 (mild acidic conditions). Electrolytic reduction of uranium (III) solutions was one method of obtaining uranium (II): $\text{UO}_4^{2-} + e^- \rightarrow \text{UO}_2^+$. Chemical reducing agents were successful also. Zinc amalgam, for example, was found to
effect a rapid conversion of dilute uranyl chloride solution (UO₂Cl₂) into uranium (II), or UO₂Cl₁, in better than 50% yield. It was noted that with all methods of preparation, solutions of uranium (II) were frequently prepared which resisted disproportionation—into U (III) + U(I)—for a long time, then suddenly began to disproportionate rapidly. No conditions were found for the direct oxidation from the tetravalent to the pentavalent state. Oxidation of the pentavalent to the hexavalent state, however, occurred readily with a number of oxidizing agents, including atmospheric oxygen, ferric salts and ceric salts.

Instead of giving rise to uranium (II) on hydrolysis, uranium pentachloride initially yielded the I and III oxidation states; but at an acidity near pH 2 uranium (I) and uranium (III) reacted rapidly to yield appreciable concentrations of uranium (II).

Radioactive Carbon Compounds. Ordinary carbon is of atomic weight 12. Of the two isotopes C₁³ and C₁⁴ the latter is radioactive. In the past its availability had stimulated studies on the preparation of organic compounds containing it because tracer techniques had made it possible to follow the fate of radioactive compounds in chemical or metabolic processes.

In reporting a few syntheses involving radioactive carbon, radioactive barium carbonate, BaC₁⁴O₃, is a convenient starting compound. Richard Abrams of the University of Chicago developed a method of converting it into hydrogen cyanide, H₂C₁⁴N. The carbonate was mixed with lead chloride, from which carbon dioxide, C₁¹O₂, was readily liberated by direct heating, since the intermediate lead carbonate PbC₁⁴O₄, decomposes at the low temperature of 315°C. The carbon dioxide was reduced to carbon (C₁⁴) by reaction with red hot magnesium powder. After separation of magnesium compounds by means of hydrochloric acid, the carbon was then heated to 1000°C in a quartz tube in a stream of ammonia gas, thereby producing radioactive hydrogen cyanide, which was collected in alkaline solution.

Toluene, with C₁⁴ atoms in position 1, 3, 5 of the benzene ring (i.e., toluene-1, 3, 5-C₁⁴), was synthesized in 62% yield by Dorothy Hughes and James Reid of the University of California, Berkeley, starting with radioactive pyruvic acid, CH₂C₁⁴OOCOH, which was available. This acid was condensed, in the presence of alkali, to the triacryl oxide (II), and it in turn was dehydrogenated to tolenetricarboxylic acid (III). Toluene, with C₁⁴ atoms in position 1, 3, 5 of the benzene ring (i.e., toluene-1, 3, 5-C₁⁴), was synthesized in 62% yield by Dorothy Hughes and James Reid of the University of California, Berkeley, starting with radioactive pyruvic acid, CH₂C₁⁴OOCOH, which was available. This acid was condensed, in the presence of alkali, to the triacryl oxide (II), and it in turn was dehydrogenated to tolenetricarboxylic acid (III).

Decarboxylation of II into the radioactive toluene (III)

was accomplished by heating with copper oxide in the presence of quinoline. C₁⁴ atoms in formulas I-III are designated with asterisks.

Radioactive carbon has a half-life of 5,673 to 5,767 years and by measuring the disintegrations per minute per gram (the "activity" of carbon obtained from very old samples of wood, W. F. Libby and his co-workers at the University of Chicago showed that this method was capable of establishing the age of such samples. Libby experimented with redwood whose tree rings dated it to between 1031 and 928 b.c., and with wood from the tomb of Zoser at Sakkarra which dated back to between 2575-2725 b.c. The observed specific activities of the carbon obtained from samples of wood of known age were remarkably close to the values obtained from the half-life curve for radioactive carbon.

Cracking Catalysts. Catalytic cracking of petroleum hydrocarbons had assumed major industrial importance. Charles L. Thomas of Universal Oil Products company, Chicago, Illinois, presented the existing knowledge regarding this process, especially with regard to silica-alumina catalysts.

Silica alone is either inactive or only faintly catalytic. Alumina by itself is better than silica but is a poor cracking catalyst. The proper combination of silica and alumina gives rise to a superior cracking catalyst; but to make such a catalyst, it is necessary to start with the hydrogels or hydroxides of both silica and alumina. Mixtures of the anhydrous oxides are not catalytic nor are mixtures of one anhydrous oxide with one hydroxide oxide. The silica-alumina catalyst apparently has certain acidic properties, and Thomas believed that it was this acidity that is responsible in large measure for the effective catalytic activity.

To assure the absence of inorganic materials other than silica and aluminium, Thomas used ethyl orthosilicate and aluminium isopropoxide as sources of silica and alumina, respectively. Mixtures of these two substances in varying ratios were hydrolyzed by use of distilled water and alcohol. Acidity of the silica-alumina catalyst was determined by leaching with an excess of dilute potassium hydroxide solution for one-half hour, then back-titrating the unused hydroxide with hydrochloric acid to a phenolphthalein end point. The maximum acidity was found for catalysts wherein the ratio of aluminium to silicon was 1, but high acidities persisted at a ratio of 2.

The maximum catalytic activity, as determined by passing Pennsylvania gas oil over the catalyst at 500°C. to obtain both gas and gasoline, was also at an Al:Si ratio of 1 to 2, but closer to 2. This proved that catalyst activity, acidity and composition were related in the silica-alumina catalyst, especially since they were prepared in such a way as to exclude the use of mineral acids.

It was suggested that the active constituent of this catalyst is (HAl₂SiO₅). Since maximum activity was obtained at an Al:Si ratio of 2 whereas maximum acidity was reached at a ratio of 1, Thomas suggested that the catalyst mass behaved as if it were made up of an active part having an Al:Si ratio of 1 plus an inert silica support.

Silica-magnesia, silica-zirconia, alumina-boria and titania-boria catalysts were considered from the same viewpoint with the conclusions that (H₂MgSiO₄), (H₂ZrSiO₄), (H₂Al₂O₃) and (H₂TiB₂O₇) should represent the formulas, respectively, for the catalytic parts of these combinations.

To illustrate the mechanism of catalytic cracking, one set of equations will be presented making use of di-isobutylene and the silica-alumina catalyst.

\[
(CH₂)₃CCH₂C(CH₃)₂ → CH₃ + HAl₂SiO₅ \rightarrow (CH₂)₃CCH₂C\]

Then the tert-butylion, (B), may react with di-isobutylene to form (A) and (D), thus causing a chain reaction, since (B) will be regenerated in the process; or (B) may react with (Al₂SiO₅) to yield (D) plus the original catalyst.

B. S. Greensfelder, H. H. Voge and G. M. Good of Shell Development company, Emeryville, California, investigated the cracking of pure hydrocarbons both with and without catalysts. The ionic mechanism developed by Thomas was confirmed when acid-treated clays or silica-alumina catalysts were taken. When no catalysts were present, or when neutral
substances were present, a free radical mechanism was called for to explain the results. Activated carbon, a non-acidic catalyst, gave a unique product distribution which was explained as a quenched free radical type of pyrolysis. Activated pure alumina, with only weakly acidic properties, was found to induce primary pyrolysis corresponding to the free radical mechanism and secondary cracking in conformity with an ionic mechanism.

Oxidation of Hydrocarbons. Attention was also given in 1949 to the homologous, gas phase oxidation of lower hydrocarbons such as ethane, propane and isobutane by oxygen gas. This was the work of Frederick Rust, William Vaughn and others of Shell Development company. The reaction at 160°C. was found to be greatly modified by the presence of hydrogen bromide. Ethane chiefly gave rise to acetic acid, propane to acetone, and isobutane or other branched alkanes to stable peroxides.

Oxygen was believed to react first with the hydrogen bromide present to liberate a bromine atom, which then reacted with the hydrocarbon to form a radical: \( R_2CH + Br^- \rightarrow R_2C+=Br \). Oxygen then attached itself to the radical to form \( R_2C=O-O = \) and this in turn reacted with hydrogen bromide to form the peroxide and bromine atom which perpetuated the operation: \( R_2COO + Br^- \rightarrow R_2C=O-O-H \rightarrow R_2COO+HBr \). The peroxide radical combines simultaneously with the alkyl radical, \( R = \), to yield the symmetrical alkyld peroxide, \( R_2C=O-O-CR_3 \). The yields of organic peroxides in these experiments were high. Thus for every 100 moles of isobutane consumed, there were formed 14 moles of \( t \)-butyl hydrogen peroxide, 20 moles of \( di-t \)-butyl peroxide, and 31 moles of \( t \)-butyl alcohol. Between 64 and 73 moles of acetic acid were formed per 100 moles of ethane consumed in similar experiments with ethane conducted at 210-220°C.

Aldehydes. Studies on the conversion of thiophene into its aldehyde, \( 2 \)-thenoic aldehyde, were carried on by two groups, namely, W. J. King and F. F. Nord of Fordham university and W. S. Emerson and T. M. Patrick, Jr., of Monsanto Chemical company, Dayton, Ohio. It will be recalled that thiophene became available by way of the high temperature reaction of butane and sulphur. One approach to the aldehyde was the reaction of thiophene, \( N \)-methyl-formanilide and phosphorus oxychloride. In another method, thiophene was first converted into 2-thienyl chloride by reaction with formaldehyde and hydrogen chloride. Hydrolysis to thienyl alcohol and oxidation with chromic acid at ice temperature completed the synthesis. The reactions of thenoic aldehyde greatly resembled those of benzaldehyde.

A related study was made by H. D. Hartough and J. J. Dickert, Jr., of Socony-Vacuum laboratories, Paulsboro, New Jersey, who used aminomethylation (with formaldehyde and ammonia) of thiophene as the approach to 2-thienoic aldehyde. The first substance formed is \( N \)-thienylformaldehyde, \( (C,H,S)=CH, \; N=CH_3 \), or its dimer. It tautomerizes and hydrolyzes under conditions of mild acidity giving rise to 2-thienoic aldehyde in high yield.

V. Deulofeu and A. E. A. Mitta of Buenos Aires, prepared 4-imidazolcarboxaldehyde by direct oxidation of imidazolylcarbinol, the latter being made from fructose in the presence of ammonical cupric acetate and formaldehyde. Perhaps the most interesting reaction studied by these investigators, was the condensation with hydantoin leading, after hydrolysis to histidine, one of the essential amino acids in nutrition, formed on hydrolysis of proteins.

An ingenious synthesis of cyclopentenecarbonal was reported by James English, Jr., and G. W. Barber of Yale university. Catechol (or homologues of catechol) was hydrogenated to 1, 2-cyclo-hexane-diol. Being a glycol, the latter was cleaved by lead tetra-acetate to yield adipaldehyde. The best conditions found for the self-condensation of this dialdehyde were heating at 110°C. with water in a sealed tube for five hours. A 60% yield of 1-cyclohexene-carbonal was obtained.

Stereochemistry. Most naturally occurring carbohydrates and alpha amino acids are capable of turning the plane of polarized light when such light is passed through a solution of the substance. This is caused by the presence of one or more asymmetric atoms in the molecule. A carbon atom is asymmetric if it holds four different atoms or groups. Obviously, if one of the four groups is fixed for reference, the other three groups are arranged either in clockwise or counterclockwise fashion. Both of these arrangements are realizable in practice. One of the isomers is called “D” and the other “L.”

It was not a simple matter to relate the clockwise direction of different compounds but precise information was accumulated regarding most of the carbohydrates. Thus in \( D \)-glyceraldehyde (IV), \( D \)-glucose (V), \( D \)-glucosamine (VI), all showing (+) rotation of polarized light, and \( D \)-fructose (VII), of (−)

rotation, the atoms set off in a rectangle all show the same clockwise arrangement of \( H \) to \( OH \) to \( CH₂OH \) (if viewed from below). The term “D” refers to this structural feature.

\( D \)-glycerose is readily converted into \( D \)-glyceric acid of known structure (VIII). Natural (+)-rotatory alanine, being \( COOH | COOH | COOH |
| HCOH | HCNH₂ | H₂N-CH |
| CH₂OH | CH₂ | CH₃ |

2-aminopropionic acid, could be either IX or X. M. L. Wolfmam, R. U. Lemieux and S. M. Olin of Ohio State university, presented a series of reactions correlating the structures of the hydroxy acid (VIII) and the amino acid (X).

The starting point was natural \( D \)-glucosamine (VI), obtained from chitin (in oyster shells) by hydrolysis. The top CHO group was converted to \( CH₂ \) by mercaptation, acetylation and reduction with Raney nickel. Then, while the \( NH₂ \) group alone was acetylated (i.e., \( NHCOCH₃ \)), the bottom three carbons of the chain were cut off by means of lead tetra-acetate. Thus, VI changed to XI.

Oxidation of the aldehyde group to carboxyl and hydrolysis of the acetyl group yielded an alanine of structure XII.

\( CH₃ | CH₃ | (XI) | HCNHCOCH₃ | (XII) | HCNH₂ |
| CHO | COOH |

If this is turned through an angle of 180°, it is obvious that it is the same as X. The compound was (+)-rotatory, the same as the L-alanine obtained from the hydrolysis of proteins.
Raney nickel to a CH₃ group, then removed the bottom three carbons with lead tetra-acetate and oxidized the resulting aldehyde to acid (XIV), which was the same compound as that produced by methylation of (+)-rotatory L-lactic acid (XV). It so happened that the configurations of both these compounds (glucose and lactic acid) were already established, but this new chemical method provided an added confirmation.

Synthesis of a Pyrethrum Insecticide. M. S. Schechter, N. Green and F. B. LaForge of the U.S. Bureau of Entomology and Plant Quarantine announced the successful synthesis of an active principle of pyrethrum. The natural source of this insecticide is the flower of pyrethrum (Chrysanthemum cinerariefolium), mostly imported from Japan before 1940, but later chiefly from Kenya and the Belgian Congo.

H. Staudinger and L. Ruzicka studied the active component “pyrethrolone” in 1924. Twenty years later LaForge and W. F. Barthel established the fact that this supposedly homogeneous material was a mixture of two related hydroxy cyclopentenones. The name pyrethrolone was retained for the major component, and “cinerolone” was suggested as a name for the other. Pyrethrolone possesses a 2,4-pentadienyl side chain and cinerolone has an analogous 2-butenyl group.

The 1949 contribution of Schechter et al. was the synthesis of cinerolone from pyruvic aldehyde, CH₂COCHO (A), and a beta keto salt, RCH₂COCH₂COONa (B), in such a way as to establish the structure as 4-hydroxy-3-methyl-2-β-butenyl-2-cyclopentenine. It had been assumed earlier that the hydroxy group was at position 5. This synthesis may be followed from A+B in these steps:

\[
\begin{align*}
\text{CH₂CO} & \quad \text{H₂CR} \\
\text{HOCH} & \quad \text{CH₃CO} \\
\text{CH₃OH} & \quad \text{CH₃}
\end{align*}
\]

This condensation proceeds in the presence of sodium hydroxide, the group R being CH₂CH₃.

The toxicity of the synthetic compound proved to be equal to that of the natural product. Also, the “knock-down” action was the same. It was believed that the commercial synthesis of this material might be anticipated, in view of the availability of the necessary basic materials, especially since the future of DDT for use on dairy cows was being questioned.
Chloromycetin. This compound, also called chloramphenicol, was isolated in 1948 from a soil organism, *Streptomyces venezuelae*. It is an antibiotic which was shown to have a considerable spectrum of therapeutic activity against many pathogenic organisms.

Chemists at Parke, Davis and company ( Mildred Rebstock, Harry Crooks, Jr., John Controulis) were successful not only in elucidating many of its chemical properties but also in developing a method of synthesis.

The empirical formula of chloromycetin is C₇H₈ClN₃O₈
It is relatively stable, neutral, optically active, and melts at 150°C. It possesses a benzene ring, a nitro group and an amide function. The nitro group is most unusual, since in no other known natural product does such a group occur. The complete structure proved to be:

\[ \text{Cl}_2\text{CHCONH-CH-CHOH-C}_6\text{H}_4\text{NO}_2 \]

\[ \text{CH}_2\text{OH} \]

In conformity with this structure, the compound hydrolyzes to yield dichloacetate acid and an amine, HOCH₂-CHNH₂-CHOH-C₆H₄NO₂. Periodic acid cleaves this amine (but not the original chloromycetin) to yield p-nitrobenzoic acid, as would be predicted from the structure assigned.

To synthesize the compound, the investigators started with benzaldehyde and 2-nitro-1-ethanol. The nitro group of the 1-phenyl-2-nitro-1, 3-propanediol, C₆H₄CHOH - CHNO₂ - CH₂OH, thus produced, was hydrogenated to an amino group. By reaction with methyl dichloacetate the amino group was converted to the desired amide. Then, after protecting the hydroxyl groups by acetylation, the benzene ring was nitrated. Decacytlation by mild alkaline conditions completed the synthesis. The compound was also synthesized differently, starting with p-nitroacetophenone.

Patulin. Patulin is a mould metabolite and antibiotic. Until recently, its structure was thought to be XVI. New evidence caused P. A. Plattner of Switzerland to reject this structure in favour of XVII. A still different structure, however, was proposed (XVIII) by R. B. Woodward and G. Singh of Harvard university and by H. J. Dauben, Jr., and F. L. Weisenborn of the University of Washington, Seattle. Infra-red and ultra-violet spectra of patulin and its derivatives supported XVIII, as did the reaction of patulin with thionyl chloride. This is a reagent for the hydroxyl group, and the reaction did give rise to patuloy chloride wherein the OH group of XVIII was replaced by chlorine. (See also Atomic Energy; Biochemistry; Chemotherapy; Chemistry; Electronics; Food Research.)

BIBLIOGRAPHY. Chemical Abstracts. vol. 43

CHEMOTHERAPY. Among the more startling reports on medical advancements in 1949 were announcements that Compound E (cortisone), from the adrenal gland, and ACTH, from the pituitary gland, produced dramatic relief in some instances for people with rheumatoid arthritis. These substances also showed promise in the experimental control of rheumatic fever, allergies and even cancer. Only small amounts of the drugs could be obtained. Pituitary glands from 400,000 pigs were required to make one pound of ACTH. This was such an expensive process that the drug at one time, if sold, would have cost approximately $4,500,000 a pound. It seemed unlikely that unlimited quantities would be available for a long time; newer methods of production and synthetic substitutes were needed to provide a solution to the problem. The drugs could not be used carelessly. Undesirable reactions, for example mental changes, were produced at times, even when the drug was carefully administered. Other unwanted effects included the development of growth of hair and masculine features in women who were being treated.

Another new cure was widely promoted for the common cold. This treatment consisted of the administration of anti-histaminic substances—chemical compounds used for the control of certain allergic phenomena. While certain research findings offered sufficient promise to justify further trial of these drugs, the Council on Pharmacy and Chemistry of the American Medical association in view of the flamboyant wave of advertising in the U.S. then followed the announcement of these reports, issued a warning against expecting too much from the use of the substances and against the harmful possibilities that could follow their use. The council warned that instances had been reported of users of these drugs becoming drowsy and even falling asleep while at work and, in occasional cases, while driving cars or operating machinery. The council also warned that experience with these substances so far was insufficient to permit knowledge of whether they are harmless when used over long periods of time and that the amounts taken in persistent colds might exceed what had been established as normally safe.

A chemical related to the anti-histaminics was dramamine, which when tried as an anti-histaminic for allergy, was found to have far more therapeutic effectiveness when administered for motion sickness. After extensive trials, particularly on the U.S. army transport “General C. C. Ballou” in Nov. and Dec. 1948, dramamine was shown to be effective for the control, in the majority of instances, of motion sickness, on boats, in aircraft and in cars. Subsequent investigations during 1949 also revealed promise for the use of this drug in irradiation sickness, migraine headaches and nausea and vomiting in expectant mothers.

The usefulness of chloramphenicol (chloromycetin) for virus, rickettsial and other diseases was extended. Of importance, however, was its synthesis, which did not result in the development of a cheaper commercial method of production but did contribute to the knowledge necessary for the synthetic development of antibiotics. Another antibiotic, aureomycin, was reported effective against several diseases such as amebic dysentery, shingles, whooping cough and, particularly, undulant fever.

The drug treatment of tuberculosis was advanced by further studies on para-aminosalicylic acid (PAS) and a new chemical from Germany known as tibione. Experimentally, a mould derived from hops was also shown to be active against typical germs in mice, but, unfortunately, caused damage to the kidneys.

The results of an extensive survey in the U.S. by the Therapeutic Trials committee of the Council on Pharmacy and Chemistry revealed that hormones in some instances might be used for the palliative treatment of patients with cancer, but these substances could not be regarded as cures. In some patients cancer progresses so far before it is detected that operation or irradiation with radium or X-rays is impracticable. In such instances, administration of hormones, androgens or estrogens (the so-called male and female sex
hormones) resulted in prolonging the lives of many of the patients treated and lessening pain. Sooner or later, however, the patients died; a drug cure for cancer still did not exist. Of related interest were further explorations on aminopterin for lymphatic leucæmia, urethane for myeloid leucæmia and nitrogen mustard for monocytic leucæmia. These drugs also failed as cures but, on the other hand, when given to carefully selected patients, effected relief from symptoms and caused general improvement.

Antabuse (tetraethylthiuram disulphide) was reported to be an aid in the treatment of alcoholics. This chemical, long used in the rubber industry, produces intense vomiting when administered prior to the drinking of alcoholic beverages but does not seem to have any effect when alcohol is not taken. Apparently the vomiting is caused by the drugs interfering with an enzyme system which is concerned with the metabolism of alcohol. Use of this chemical for the treatment of alcoholics was first reported from Copenhagen, Denmark; it was being investigated in other countries during 1949. Its true role as a therapeutic agent awaited further evidence. It could produce dangerous effects if given carelessly and was never to be administered except when the receiver was under close medical supervision.

Myanesin (tolserol) was used to obtain relaxation of muscles and was also used in the treatment of alcoholic intoxication and anxiety states. Another treatment of alcoholics consisted of the use of pentothal, which produces a drugged state in which the patient can be questioned for the cause of his drinking.

Vitamin B₁₂, a member of the B complex group, had been found useful in combating certain anemias. It was also reported to influence favourably school children who appear to exhibit growth failure. When administered by mouth to these children, it was reported to effect such a favourable response that one group of researchers suggested there might be a B₁₂ functional deficiency. (See also Pharmacy.)

CHEMURGY (chemical utilization of farm products in industry). A compilation made during 1949 revealed that industrial utilization of agricultural materials in the United States had increased until the total value of farm products going into chemurgic uses considerably exceeded $1,000 million annually. A study released early in the year indicated that the total for the last year for which complete figures were available, 1947, had reached $1,187,525,000, and it was believed that, as a result of further expansion during the two subsequent years, the annual rate had probably exceeded $1,250 million.

Among the items included were oils and fats, $700 million; corn and other grains for wet milling and distillation, $219,600,000; wood pulp, $40 million; and cotton linters, $15,125,000, for making chemical grade cellulose; tobacco used for producing nicotine and salts, $2,500,000; dairy products for lactic acid, $15 million; for casem, $8 million; for lactose, $5 million, and other items; sugar-cane bagasse and molasses, $3,500,000; naval stores, $103 million. Other chemurgic products on the list were glycerol, $40 million; furfural, $4,500,000; lecithin (from soybeans), $1 million; sodium glutamate, $8 million; tanning extracts, $12 million; and about $10 million worth of other materials such as products from flax straw, wheat straw, corncocks, biological materials and numerous agricultural residues.

The Corn Products Refining company completed and began operating a 135 ac. plant during 1949 at Corpus Christi, Texas. When operating at capacity the factory would produce annually 100 million lb. of dextrose from milo, which is grown extensively in Texas, besides starch, oils, and 50,000 tons of livestock feed. Demand for dextrose was substantially increased during the year as the tyre manufacturers converted to the new cold rubber process, which utilized the corn sugar in large volume.

A new market for casen opened during 1949 which, it was thought, might consume more than $2 million worth annually. The casen was used in the production of curled casein, a synthetic fibre so treated as to possess the resiliency of horsehair. As casen sold at 94 cents a pound as compared with $1.25 and more a pound for Argentine horsehair, curled casein started in a favourable economic position. Its manufacturer, the Rubber-Set company, found an early market in an automotive air filler, a use involving a potential demand for 1 million lb. a year. Mattress and furniture manufacturers were expected to adopt the product, especially since the casein fibre was dependably clean and uniform.

Interest in the new crop field was greatly heightened during 1949 by the announcement that a cure for arthritis had been derived from an African plant of the Strophanthus species. The curative agent, known generally as cortisone, had first been extracted from ox bile. The process proved almost prohibitively expensive; and calculations indicated that all the cattle annually slaughtered could not provide enough of the active material to meet the needs of rheumatic diseases. Discovery of the plant source resolved immediately. In expeditions being dispatched, one by the U.S. government and one by private interests, to obtain seeds and cuttings of Strophanthus for study and for reproduction. Following the announcement, it was also revealed that closely similar compounds were obtainable from the Mexican yam and from the soybean. (See Medicine.)

The exceptional interest created by the cure for arthritis stimulated curiosity as to the values which may be concealed in many other species of wild plants. It was pointed out that while the earth's flora includes about 300,000 species, only about 1,500 kinds had been put to human use. It was believed that vigorous plant exploration, coupled with the application of such new tools as organic chemistry, plant genetics and power equipment, might discover that many neglected species in the vegetable kingdom could be made valuable to man and could be made profitable agricultural commodities. Fewer than 200 species are cultivated commercially in the U.S. Aromatic tobaccos of the Turkish types were grown extensively in the U.S. for the first time in 1949. More than 1,500 ac. were reported harvested in 16 mountainous counties in the western areas of the Carolinas and Virginia. This was a new crop, being a type of tobacco formerly imported, and only adapted to areas which up to 1949 grew no other kinds of tobacco. The crop returned a gross of $750 to $1,000 an acre to the farmer. The research was headed by F. R. Darks of Duke university.

Although chemurgic studies have usually been undertaken to increase the nonfood markets of agriculture, the research programmes have led to new discoveries in the food field. One new principle of food preservation resulted in frozen concentrated orange juice, which during 1949 consumed about 10% of the Florida orange crop. A process called dehydrofreezing, which partially dried and then froze, promised to save space and weight in the storage and transportation of several kinds of fruits and vegetables.

CHESS. The 24th congress at Hastings, Sussex, ended on Jan. 7, 1949. N. Rossolimo (France) won with 6½ points; I. König (Yugoslavia) was second with 6 points and W. J. Mühring (Netherlands) third with 5½ points. Two British players, B. H. Wood and W. A. Fairhurst were equal fourth. At the international congress at Southsea, Hampshire, in April, the “Swiss” system was used in a tournament in England for the first time. Except for the first round the...
The 1949 German champion, V. Bogoljubow, playing simultaneously against 40 opponents at Darmstadt on Nov. 5, 1949.

pairing was not arranged; instead the leaders after each round were drawn together in the next round, with the proviso that no contestant should play another more than once. The contest was also won by Rossolimo with 9 points; second was L. Pachman (Czechoslovakia) with 8 ½ points.

The British championship at Felixstowe, Suffolk, was won by H. Golombek, and Eileen Tranmer won the women's championship. A radio match between London and Sydney resulted in a win for London with 64 points to 34. Oxford defeated Cambridge by 6 games to 1 and, having previously beaten London university by 7 games to 3, thus retained the championship of the Southern Universities' association.

The Soviet championship resulted in a tie between David Bronstein and Vasili Smyslov, each with 13 points out of 19. A match of six games started on Dec. 19 to decide the championship. A tournament for the women's championship of the world began in Moscow in December.

S. Tartakover (France) won the tournament at Beverwijk, Netherlands, in January. In Vienna the Schlechter Memorial tournament resulted in a tie between Jan Foltys (Czechoslovakia) and Stojan Puc (Yugoslavia). A match was played between teams of eight players representing Budapest and Moscow. The Moscow team won in Budapest by 38 points to 28, and in Moscow by 48½ points to 15½.

The German championship at Bad Pyrmont, Hanover, was won by V. Bogoljubow. W. Unzicker, German champion in 1948, won a tournament at Heidelberg. G. Stahlberg (Sweden) won a tournament at Trencianske Teplice, Czechoslovakia, and at Venice L. Szabó won with 11½ points out of 15.

CHIANG KAI-SHEK, Chinese army officer and statesman (b. Fenghua, Chekiang, Oct. 31, 1887), was president of the republic from 1928 to 1931, several times prime minister, generalissimo of the Chinese forces after the Japanese aggression (July 7, 1937) and again president of the republic from Sept. 1943. (For his career see Encyclopædia Britannica and Britannica Book of the Year 1949).

He "retired" on Jan. 21, 1949, from active service as president of China with the hope of ending the civil war. However, the Communists named him as the chief war criminal and principal tool of "American imperialism," and regarded his move as a trick. Despite Chiang's retirement his position as director-general of the Kuomintang and his personal influence over many of the Nationalist generals made him the authority behind the scenes. After the Communists had taken Nanking, Chiang appeared in threatened Shanghai on April 27 and again took an active part in the struggle. As the Nationalist capital moved from Nanking to Canton, Chungking, Chengtu and Taipeh, Formosa, Chiang hurried between these points to rally anti-Communist forces. On July 16 a Supreme Policy council with Chiang as chairman and acting president Li Tsun-jen as deputy chairman was formed in Canton to direct the fight against the Communists. Chiang visited President Elpidio Quirino of the Philippines on July 10-11 and President Rhee Syngman (q.v.) of Korea on Aug. 6-7 in an attempt to form a Pacific union against communism. These efforts and his repeated bids for U.S. aid brought no favourable response from Washington. With acting president Li's departure for the United States late in the year, Chiang virtually exercised the authority of the presiding National government.

CHICAGO. Second largest U.S. city, at the southwest corner of Lake Michigan, Chicago is the largest centre of U.S. rail and air traffic. Population of the city proper (1940 census): 3,396,808. The U.S. census bureau estimated the population of the city in May 1949 at 3,632,808 and the population of the entire metropolitan district at 5,395,524.

Mayor, Martin H. Kennelly.

Chicago enjoyed a comparatively tranquil year in 1949 with business activity slowly declining. Bank clearings for the year dropped to $35,807 million from $38,886 million in 1948. Retail sales for 1949 were estimated at $4 billion, or almost the same as in 1948. Except for the steel strike there was a marked decline in the number of industrial disputes and the number of workers involved. They were relatively 70 and 64,887 in 1949, compared with 506 and 218,948 in 1948. Passengers carried in the lines of the Chicago Transit authority declined, but the C.T.A. also ended its monthly deficits because of an increase in fares.

A modernized building code was adopted by the city council on Dec. 30 in the hope of stimulating private home building, in which Chicago had lagged far behind the country at large and far behind its own suburbs.

The 1950 budgets of the six governments that cover Chicago in the whole or in part were as follows; city of Chicago corporate fund, operating expenses only (excluding bond interest, pension fund, etc.) $81,337,584; Cook county $37,346,364; Chicago School board $111,784,314; Chicago Sanitary district $29,533,913; Chicago Park board $19,188,717; Cook County Forest preserve district, approximately $3,500,000.

(L. H. L.)

CHIFLEY, JOSEPH BENEDICT, Australian statesman (b. Bathurst, New South Wales, Sept. 22, 1885), became prime minister and treasurer on July 13, 1945. (For his early career see Britannica Book of the Year 1949.)

In April 1949 he attended the Commonwealth prime ministers' conference in London where a formula was found whereby India could become a republic yet remain in the Commonwealth. He visited Paris on April 24 for talks with H. V. Evatt (q.v.), who was in Europe in connection with Australia's appeal to the Privy Council. He returned to Canberra on May 3 and a week later it was announced he was under observation for suspected smallpox. In June and August he presided over meetings of the state premiers. On Sept. 7 he presented his budget to the House of Representatives and announced that Australia would make a further gift of £10 million to Britain. In August he visited South Australia and Western Australia and, before the general
CHILD LABOUR: see Juvenile Employment.

CHILDREN'S BOOKS. The abolition of restrictions on the use of paper for books led to an increased output and an improvement in physical quality in Great Britain although some volumes fell short of a desired minimum standard in appearance, durability and content. Geoffrey Trease's Tales out of School, a critical appraisal of children's literature, stimulated interest in children's reading. The Times Literary Supplement devoted two sections exclusively to children's book reviews (July 15 and Oct. 21). The Library association Carnegie medal was awarded to Richard Armstrong for his Sea Change.

Several biographical works were issued, including Swan of Denmark, a sensitive study of Hans Anderson by Ruth Manning-Sanders; Fortune my Fo, a readable account of Raleigh by Geoffrey Trease and Nelson the Sailor, a critical portrait for older boys by Russell Grenfell. Evelyn Cheesman recounted her own experiences in Camping Adventures in Cannibal Islands and imaginary adventures of young castaways in Marooned in Du-Bu Cove. The Story of Art by E. H. Gombrich and Our Bird Book by Sidney Rugerson and Charles Tunnicliffe were amply illustrated. Practical advice was given in H. L. Heys' Chemistry Experiments at Home. The Story of your Home by Agnes Allen and The Young Traveller in India and Pakistan by Geoffrey Trease were pleasantly informative. The Children's Theatre Book by C. C. le Walton was a vivid introduction to stage technique. Arthur Stanley edited The Bedside Book for Children, a wide ranging anthology.

Additions to folklore included The Essential Uncle Remus, a wise selection of Brer Rabbit tales with the original illustrations; African stories in Where the Leopard passes by Geraldine Elliot and Legends of the United Nations by Frances Frost. The Cat who went to Heaven was a Chinese legend of unusual delicacy and charm by Elizabeth Coatsworth. H. M. McGill retold Perrault's Tales of Long Ago; Robert Lawson based his admirably illustrated Robbit on a well known legend and Eleanor Färjeon contributed original fairy stories in The Old Nurse's Stocking Basket.

There was rollicking fun and fantasy in Eric Linklater's The Pirates in the Deep Green Sea and Ian Serrailier's Captain Bunsahboard and the Pirates: sly humour and magic in J. R. R. Tolkien's Farmer Giles of Ham and animal characters in Hugh Lofting's Doctor Dolittle and the Secret Lake.

Among picture books of distinction were Edward Ardizzone's virile Tim to the Rescue, Kathleen Hale's gay and detailed Orlando keeps a Dog and The Story of Noah, told and drawn with deceptive simplicity by Clifford Webb.

Books for boys included P. H. Newby's The Loot Runners, an exceptionally polished tale of modern smugglers, and John Connell's The Return of Long John Silver, a worthy continuation of Treasure Island. David Severn introduced a supernatural element in Dream Gold, Snow Dog by Jim Elgärd and Saltwater Summer by Roderick Haig-Brown were vigorous tales of North America.

Modern social problems determined the plot of A House of Their Own, a convincing story by Martha Robinson and Tasmanna formed the background to They found a Cave, an effective camping-out adventure by Nan Chauncy. Amateur sleuths were busy in The "Polly Harris" by Mary Treadgold and The House on the Hill by Elisabeth Kyle. Sailing was the main theme of Kestrel by Aubrey de Selincourt and there was originality in The Voyage of the Indian Brig by Winifred Holmes. Co-op life was depicted in Winter at Pike's Steep by C. E. Roberts and The Further Adventures of Farmer Jim by C. H. Chapman, who also wrote King Cuckoo, an imaginative story of bird life.

Ancient Britain was the scene of exciting and sometimes violent adventures in Kerin the Watcher by Dorothy Severn and Boadicea by C. H. Abrahall and there was stirring intrigue in The Young Jacobites by Kenneth MacFarlane. In quieter vein, The Great House by Cynthia Harnett was a painstaking and satisfying story of life in the year 1690.

Life in other countries was skilfully blended into several stories for the under tens. New Zealand was pictured in The Book of W irearu by Stella Morice; Lapland in Somi builds a Church by R. Busoni; Africa in Blue Smoke by Y. M. Robinson and French Martinique in Simone and the Lilywhites by Marie-Louise Ventellaye. Mimif in Charge by H. J. Kaeser continued the adventures of a heroic small boy and there was irresistible humour in My Friends the Beasts by Allan K. Taylor.

United States. A distinctive contribution to folk literature was A Harvest of World Folk Tales edited by Milton Rugoff, while an unusual anthology was My American Heritage compiled by Ralph Henry and Lucile Pannell. Picture books gay with bright wash drawings were Cocolo Comes to America by Bettina and Tim to the Rescue by Edward Ardizzone. Two unusual picture books were Little Boy Brown, by Isabel Harris with drawings by Andre Francois, and Henry—Fisherman by Marcia Brown, a story of the Virgin Islands.

The mechanically minded read Pogo's Sea Trip by Josephine Norling, The Truck Book by Margaret and Stuart Otto and The First Book of Automobiles by Campbell Tatham; while The First Book of Bugs by Margaret Williamson also proved interesting.

Animal stories ran the gamut from A Horse to Ride by Grace Paull to Vison the Mink by John and Jean George; a story about turf racing was Bobcat by C. W. Anderson, while Kalak of the Ice (about bears) by Jim Kjelgaard was for junior high age.

For the middle group, Treasure Mountain (Oregon) by Evelyn Lampman and Peter's Pinto (Utah) by Mary and Conrad Buff proved interesting in their depiction of Indians and Mormons. Two stories laid in Northern Carolina were Ellis Credle's Here Comes the Showboat and Mebane Burgwyn's Lucky Mischief; Frieda Friedman in A Sundae with Judje wrote of New York city while René Prud'hommeaux dealt with adventure in the Sunken Forest. Historical stories were Frank Andrews' For Charlemagne! and Two for the Show (Shakespeare's England) by Isabelle Lawrence; Rebecca Caudill wrote of 18th century Kentucky in Tree of Freedom, while in Midnight Patriot Emma Patterson told of Revolutionary New York. The Fugitive Slave act was featured in North Winds Blow Free by Elizabeth Howard and the Civil War was the theme of Walter Edmonds' Cadmus Henry.

Stories of other countries were Golden North (Canada) by Marie McPhedran, Ali of Baku (near east) by Judith Shouisky and Ruth McGilvery, Bush Holiday (Australia) by Stephen Fennimore, At the Palace Gates (Peru) by Helen Parish and
CHILD WELFARE

An encouraging beginning was made in Great Britain during 1949 to carry into effect some of the more urgent reforms for the care of deprived children, made possible by the passing of the Children act in 1948. Under this act an obligation was placed on local authorities to board out as many as possible of the children they had under their care unless not practicable or desirable to do so. They were also requested by the Home Office to place other children in small family groups and to use large institutions only for reception purposes or for short stay children who had a reasonable chance of returning to their parents or guardians. These suggestions led the local authorities to sort out, some for the first time, the long and short stay children and to give careful consideration to the needs of the individual child. Boarding out as a method of care, in spite of the great difficulty of finding suitable foster parents, was greatly extended and in some counties was doubled. Much progress was also made in securing properties suitable for small family groups of mixed ages and sex under the care of a house mother and father. About 100 new properties were bought and adapted as new children’s homes in England and Wales.

An important requirement in the act was the appointment by each county council and county borough council of a children’s officer of suitable qualifications and experience to be responsible for the happiness and welfare of each child under its care. One hundred and forty-one out of 146 authorities in England and Wales appointed these officers who included 89 women and 43 men and all the children’s committees were set up. In Scotland 31 children’s officers were appointed out of a total of 40-45 required.

During 1949 there was a satisfactory removal of large numbers of children from national assistance institutions to nurseries and children’s homes in new premises or adapted houses. The Care of Children committee report estimated that there were 6,500 children living in public assistance institutions in England and Wales, but before and during 1949 this number was reduced to 1,000, priority being given to removing the nursery age child. In Scotland the number was reduced from 115 to 60.

Even before the act was finally passed it was realized that there would be a great need for trained staff, and urgent consideration was given by the Central Training council to the training of house mothers and fathers and boarding-out officers and to organizing refresher courses for the staff already working in local authority and voluntary residential homes for children. From the beginning of these courses 138 house mothers and fathers received a practical and theoretical training of 14 months and a similar number were in training: 160 boarding-out officers were also trained, and altogether 20 courses of different kinds were organized. Perhaps the most important were the refresher courses and the opportunity they offered to men and women from residential homes often working in remote parts of the country to come together to share experiences and to make friends, thereby losing the feeling of isolation. Apart from courses organized by Edinburgh and Glasgow universities in connection with the social science diploma or certificate, no training in child care was started in Scotland during 1949.

The act required every county authority to provide a temporary reception home for children with the necessary facilities for observation of their physical and mental condition. This observation and assessment of the needs of each child before permanent placement was vital, if each individual child was to have the opportunity to make a happy adjustment to life. The Home Office, guided by the advice of the Advisory Council on Child Care, sent a memorandum on this work to all local authorities during 1949. The experience gained in a pilot experimental reception centre in Kent demonstrated that these centres were an essential preliminary to a wise understanding of the needs of the children. This type of work makes heavy demands on the staff and it was found necessary in the Kent centre to appoint one resident adult to every three children. The visiting psychiatric team consisted of 1 psychiatrist, 2 part-time psychologists, 1 full-time psychiatric social worker and 1 full-time secretary for a group of 25 children.

The voluntary homes and organizations which cared for a substantial number of deprived children showed their willingness to co-operate, although owing to restrictions in materials and staff much remained to be done to bring the standard up to that required by the act. Nine hundred and six voluntary homes were registered; one was closed by compulsory power and two were closed after the exercise of some persuasion.

The stubborn problem of juvenile delinquency (q.v.) engaged the attention of the country during 1949. Conferences organized by the government and many organizations failed to determine the root causes of this social unhappiness and strong pressure was brought, without success, to set up a special scientific commission. It was generally felt that greater effort should be made to provide more and better playgrounds for the school age child. The typical municipal playground of barren asphalt and costly apparatus failed to engage the enthusiasm of these high spirited and adventurous children, and strong arguments were advanced for providing playgrounds more suited to their needs where they could find materials such as earth, water, bricks, timber, and facilities for constructive play and real adventure. The government embargo on the development of new nursery schools (except for the children of mothers needed in industry) was also felt to be a short sighted policy for it was during the earlier years that foundations of good health and emotional stability were laid.

(M. An.)

International Services. In the Universal Declaration of Human Rights, approved Dec. 10, 1948, by the general assembly of the United Nations children as well as adults were usually included under the term “everyone,” in the opening words of most of the 30 articles of the declaration. The interests of children were especially stressed in: “The family is the natural and fundamental group unit of society and is entitled to protection by society and the State.” (Art. 16, Sec. 3) and “Motherhood and childhood are entitled to special care and assistance.” (Art. 23, Sec. 2).

Material contributions to child health in many parts of the world were made in 1949 by the United Nations International Children’s Emergency fund (U.N.I.C.E.F.), the

The Runaway Apprentice (China) by Margery Evernden. Books about minority groups were Florence Means’s The House Under the Hill (New Mexico) and Chesley Kahmann’s Gypsy Melody. Older boys enjoyed a powerful story of big league baseball, Hit and Run, by Duane Decker; Mt. Rainier was the setting for Escape on Skis by Arthur Stapp, and Mars for Robert Heinlein’s Red Planet.

The non-fiction harvest was rich. A beginning book on plant reproduction was Bzts that Grow Big by Irma Weaber. Electrical energy from earliest times was discussed in The Bright Design by Katherine Shippen and Television Works Like This by Jeanne and Robert Bendick answered many questions. Biography ranged from George Washington by Genevieve Foster to The Youngest General (Lafayette) by Fruma Gottschalk and the unbiased The Story of Franklin D. Roosevelt by Marcus Rosenblum. In poetry there was Bridled with Rainbows, edited by Sara and John Brewton, and The Little Whistler by Frances Frost. The Bible inspired The Christmas Story edited by Elizabeth Yates and The Lord is my Shepherd arranged by Nancy Barnhart.

(E. A. Gs.)
World Health organization (W.H.O.) and by various voluntary agencies such as the Red Cross in Scandinavian countries, the Co-operative for American Remittances to Europe, Incorporated, (C.A.R.E.) and the American Friends Service committee. Children in western Europe were helped by the European Recovery Programme.

As in previous years the U.N.I.C.E.F. received some of its most generous support from small countries, both in government appropriations and in contributions from individuals. About two-thirds of the total of more than $141 million received during the two years, 1948 and 1949, in cash or pledges came from 36 governments, of which more than $70 million was from the U.S. on an equivalent basis. The U.S. provided 72% compared with 28% from other countries. The equivalent of $32 million of the United Nations Relief and Rehabilitation Administration fund's resources. The balance of more than $10 million was obtained from popular appeals in 40 countries. The work of the U.N.I.C.E.F. was not restricted by national boundaries as were many international services. It maintained programmes on both sides in China, and in 1949 operated freely in the four zones in Germany and Austria, and in the countries of central and eastern Europe.

The U.N.I.C.E.F. recognized that in parts of Asia tuberculosis among children was more than twice as prevalent as in western countries and that malaria, syphilis and yaws presented acute health problems. Consequently the programme in the east consisted mostly of supplying medicines and equipment and training local personnel in the control of specific child welfare problems. In Europe and north Africa much progress was made in the world-wide campaign to test 100 million children for tuberculosis. In those areas the work was sponsored also by the W.H.O. and the Red Cross from Scandinavian countries. In three years 18,500,000 children and young adults were tested for tuberculosis and 8,500,000 whose tests were positive were vaccinated against this disease with Bacillus-Calmette Guérin (BCG) serum. U.N.I.C.E.F. programmes were approved in 16 of the smaller countries in Central and South America.

Conferences which continued international consideration of child welfare problems began soon after World War II included the second Pan American Congress of Social Work, Rio de Janeiro, Brazil, July 2-9; the second Pan American Congress on Pediatrics, Mexico City, Mexico, Nov. 2-5; and the second Pan American Congress for the Education of Maladjusted Children, Amsterdam, Netherlands, July 18-22.

National Development. Activities sponsored by the government of India on behalf of children included a continuation of the All India Conference of Social Work, with its second annual session in Madras, Dec. 18-22, 1948. The Indian Parliament enacted laws raising the marriageable age of girls from 14 to 15 years.

Poland, like most of the other countries of Europe, made marked progress in services affecting child health. The Ministry of Health reported a decrease in infant mortality from 26·9% in 1945 to 13·3% in 1946 and 9·7% in 1947.

Uruguay developed a unified health and welfare service, the Council of the Child, a branch of a children's code enacted in 1934. The importance of keeping mother and child together and of allowing aid to the mother who had difficulty in supporting her child was emphasized; this help was also available to unmarried mothers. The care of dependent children in foster homes was also extended under the new services.

In the United States recent population increases led to the overtaxing of schools, hospitals and other facilities essential to the welfare of children and increased the need for nurses, physicians, social workers and teachers. The shortage of nurses was apparent, when many hospitals rented inadequately

staffed during the severe epidemic of poliomyelitis.

A three-year nation-wide study of child health services, completed in 1949 by the American Academy of Pediatrics, was made with the assistance of other agencies, notably the Children's bureau and the Public Health service of the Federal Security agency. A two-volume report of this study published by the Commonwealth fund, gave a comprehensive appraisal of health services, stressing two over-all needs: the inadequacy of the general practitioner's training in pediatrics and the scarcity of health services for children in rural areas.

There was little change in the child labour situation, and more than 2 million young people of 14 to 17 years of age were being employed. Federal regulation of child labour, in effect for ten years under the Fair Labour Standards act, had resulted in the reduction of much harmful employment of children. Inadequate state laws still allowed the employment of many who should be attending elementary schools. (See also Juvenile Delinquency; Juvenile Employment.)

(H. W. H.K.)

CHILE. A republic occupying the Pacific coast of South America for about 2,600 mi. and having an average width of only 110 mi. Area, 286,323 sq. mi. Pop. (mid-1949 est.): 5,709,000. Out of 25 provinces the most populated are the four central ones (Valparaiso, Santiago, Colchagua and O'Higgins): covering only under one-twentieth of the country area they have more than one-third of its total population. The racial composition, largely of European origin, includes mestizos (15%) and Indians (4 2%). The latter, numbering 231,700, are of three branches: the Fuegians, who live in or near Tierra del Fuego; the Araucanians in the valleys or on the western slopes of the Andes; and the Chagos, who inhabit the northern coastal region. The capital is Santiago (pop., including suburbs, Dec. 1946 est., 1,046,857). Other major towns (pop., 1946 est.): Valparaiso (198,068); Viña del Mar (85,725); Concepción (84,953); Antofagasta (47,326); Talca (44,859). Language: Spanish. Roman Catholicism is the dominant religion. President: Gabriel González Videla (q.v.).

History. During 1949 Chile re-affirmed its belief in democratic principles, made efficient attempts to solve its economic crisis and resisted Communist encroachments. Early in the year its relations with Venezuela burned strained because of the unexpected before the consideration of the Organization of American States the unwillingness of the military junta to allow ex-president Rómulo Betancourt, who had taken refuge in the Colombian embassy, to leave the country.

Late in January the government gave up its power to discharge Communists from public office and freed more than 700 imprisoned Communists. In the elections held in March, the first in which women voted, González Videla won a two-thirds majority in both houses of congress. Communist deputies were reduced from 15 to 6, and out of their 5 senators they retained 2 not yet due for re-election.

In his message to congress in May, President González announced that technicians were working on data for a vast irrigation project for the semi-arid valley between rich agricultural central Chile and the northern nitrate desert. He also announced that the year 1948 ended with a budget surplus of more than $18 million and that the Anaconda Copper corporation would spend more than $130 million in new processing and mining facilities.

The drop in price of copper, however, from 23 to 16 cents a pound about three years before the government had anticipated it and had been able to finish its industrialization and development plans, plus a proposed two cents tax by the U.S. on copper imports, seriously affected the country's economy. The current price was four cents less than was
required to cover costs and the creation of a government corporation to sell copper was advocated. Small Chilean-owned mines wanted to close down, but 96% of the copper-production industry was American-controlled and some other solution was needed. Alberto Baltra, minister of economy and commerce, visited the U.S. to seek a solution and urged Trygve Lie that a United Nations economic commission for Latin America be set up to make studies to carry out President Harry S. Truman's Point Four programme in Chile.

Demonstrations in the copper mines, which González Videla said had been "synchronized" to the Bolivian unrest by anti-democratic forces, caused the death of 1 soldier and the wounding of 26 other persons.

In mid-August martial law was declared to cope with the widespread disorders into which the Communists had turned the rioting initiated by university students protesting against a small increase in bus fares in Santiago. The transport strike was followed by disorders in the mining areas and a railway and bank strike. The navy was sent to protect the mines and the arrest of Communist leaders, including Humberto Arbarca, former member of the Chamber of Deputies, ended the disorder. Three hundred and twenty-five university employees were dropped as Communist sympathizers. After the disorders, foreign minister German Riesco Errázuriz, agriculture minister Victor Opaso Cousiño, public health minister Guillermo Varas Contreras and labour minister Luis Felipe Letelier resigned, but González Videla, who had emerged from the crisis with great prestige, refused to accept their resignations.

To meet the economic crisis the government decreed strict budget economy, obtained a S$25 million Export-Import Bank loan and, as from Oct. 1, upon the recommendation of the International Monetary Fund, proposed to devalue the peso from about 43 to 65 to the dollar. (On Jan. 10, 1950, the I.M.F. approved a rate of 60 pesos to the dollar.) The dollar shortage and inflation still constituted serious problems, and finance minister Jorge Alessandri expressed grave concern over their solution. (J. McCa.)

Education. Schools (1945): public primary, pupils 452,826, teachers 14,269; private primary, pupils 93,185; secondary, pupils 55,000. Teachers, including university professors, including the Catholic university of Santiago. Illiteracy (1940): 28.2%.

Agriculture. Main crops ('000 metric tons, 1948): wheat 1,041; barley 86; oats 81; rye 5; maize 71; rice 83; hemp fibre 4; potatoes 54; rice 18; sunflower 18. Livestock (1948): cattle (April), 686,310; sheep (June), 1,426; pigs (1948), 3,876; sheep (June, 1950), 1,167; horses (June, 1950), 230; chickens (1946-47), 2,000. Fisheries: total catch (1946), 61,000 metric tons. Production of wool (1948-49, grossly basis): 16,000 metric tons.

Industry. Fuel and power (1948, 1949, six months, in brackets): coal ('000 metric tons) 2,234 (992), manufactured gas (million cu metres) 142 (661); electricity (million kwh.) 1,167 (622). Raw materials ('000 metric tons): 1948: 1949, six months, in brackets: pig iron 14 4 (9.7); copper 425 (201); iron ore (60% metal content) 2,712 (1,487); nitrates of soda 1,754; gold (fine ounces) 164,254; silver (fine ounces) 861,942. Chile is leading mining-producing country in South America.

Foreign Trade. (Million pesos) Imports (1948) 1,303, (1949, six months) 686; exports (1948) 1,596, (1949, six months) 828. Leading customers (1949): U.S. 53% (UK 8%). Leading suppliers: U.S. 49%, Peru (13%), Argentina (10%).

CHINA. The most populated and second largest country of the world, China is a republic in Asia bounded on the N.E., N. and N.W. by the U.S.S.R., on the W. by Afghanistan, on the S.W. and S. by India, and on the S. by Nepal, Bhutan, Burma and Indo-China. The table below shows how the total area of 3,876,956 sq. mi. is composed, and the distribution of population:

According to the official figures of June 1948 the total population of China was estimated at 463,493,000; the difference being accounted for by war losses among the civil population, and, in the depopulated areas, Chinese, with a number of dialects, the most important being the Mandarin (or Kuanhua) which dominates nearly four-fifths of China proper. Religions: Confucianism, Taoism and Buddhism; about 10% of the population is Moslem; there are also Chinese Christians of various denominations. Chief towns (pop., 1948 est.): Shanghai (4,630,385); Tientsin (1,772,840); Peiping or Peking (1,721,546); Canton (1,128,165); Nanking (1,113,972); Mukden (1,021,057); Chungking (985,673); Tsingtao (850,308); Harbin (760,000); Hankow (721,598); Sian (628,449); Dairen, under Soviet occupation (543,690). During the year China had two governments: (1) the Nationalist, headed by Chiang Kai-shek (q.v.), which in 1949 sat respectively in five capitals (Nanking, Canton, Chungking, Chengtu and Tientsin); and had three prime ministers: Dr. Sun Fo, General Ho Ying-chin (from March 12) and Marshal Yen Hsi-shan (from June 3); (2) the Communist, formed in Peking on Oct. 1, with Mao Tse-tung (q.v.) as president of the republic (chairman of the central people's government council) and Chou En-lai (q.v.) as prime minister (chairman of the state administrative council) and minister of foreign affairs.

History. The year 1949 saw the complete collapse of the Kuomintang government and the Communists virtually in control of all China. Between January and November their captures ranged from Tientsin and Peking to Canton and, by early December, had entered the Kuomintang's last capital, Chungking. This amazing success was due less to the admittedly high ability of the Communist generals and troops than to China's weariness of Kuomintang misrule. General after general with hundreds of thousands of troops went over to the Communists. Fu Tso-yi, the best Nationalist general, surrendered Tientsin and Peking without firing a shot, and on Oct. 20 he was appointed minister of water economy in the Communist government.

On Jan. 21 Generalissimo Chiang Kai-shek announced his withdrawal from the Nanking government, in order to facilitate peace negotiations, and General Li Tsung-jen (q.v.), a well known Liberal, became acting president. A peace delegation was sent to Peking early in April, but the discussions were cut off on the 17th by a Communist ultimatum demanding virtual unconditional surrender within three days. The last remnants of the Nationalist government fled to Canton on April 23 and next day the Communists entered Nanking.

This stage was marked by an unfortunate clash with Great Britain when, on April 20, H.M.S. "Amethyst," *en route* to Nanking with supplies, was heavily fired on and disabled
by Communist batteries: 13 officers, including her captain Lieutenant Commander B. M. Skinner, were killed and 15 wounded. Medical relief was sent by air but attempts by H.M.S. "London," "Black Swan" and "Consort" to tow her out failed, the ships being badly damaged. The total casualties in the four ships were 44 dead and more than 80 wounded. All attempts to negotiate the "Amethyst's" release failed. Finally on the night of July 30, repairs having been improvised by the crew, Lieutenant Commander J. S. Kerans, who had been in command, decided to make a dash for it, and in pitch darkness brought her 140 mi. down the river to the open sea and eventually to Hongkong. The exploit by all concerned was in accord with the highest traditions of the Navy.

After Nanking the Communists advanced in a double sweep by Hangchow and Soochow upon Shanghai which they entered on May 25. Another army captured Hankow on May 16. The provinces of Kiangsi and Hunan were occupied by early in August; on the coast Foochow fell on Aug. 17 (a day after the surrender of Canton), Amoy on Oct. 17, Swatow on Oct. 21. The last good Nationalist army under Pai Chung-hsi, the minister of defence, which had been expected to hold the border of Kwangtung, retired into Kiangsi and the Kuomintang government fled to Chungking. Meanwhile other Communist armies, between Aug. 26 and Sept. 23, successfully overran the vast north-western provinces of Kansu, Ninghsia and Chingsai, the local Moslems, who had been expected to fight, making no resistance.

After the fall of Nanking it became clear that Chiang Kai-shek's retirement in January was more one of form than reality. He had withdrawn the government's treasure, troops believed to number 400,000, and the bulk of the navy and air force to Formosa as a base to carry on the war and in June the government at Canton announced a blockade of the China coast to begin on the 25th. The Blue Funnel liner "Anchises" at Shanghai had already thrice been bombed and had to be beached though she was eventually got away to Japan. The British and U.S. governments refused to recognize the blockade; but nothing was done to protect ships going to or from Shanghai except outside territorial waters. Several ships were fired on or taken to the Chusan islands and held for varying periods. An attempt to blockade Tientsin was defeated by the Communists seizing the Nationalists' island bases in the gulf of Chihli. But at Shanghai the foreign merchants, already badly hit by the Communists' taxation, suffered enormous losses.

In July Chiang visited President E. Quirino of the Philippines and in August President Syngman Rhee of Korea in a fruitless effort to work up a defensive Pacific pact against the Communists; and during the autumn he was ceaselessly on the move between Formosa, Canton and Chungking. Relations between him and acting president Li Tsung-jen had always been bad and on Oct. 21 Li retired to Hongkong, Chiang apparently resuming the presidency.

On Oct. 1 the People's Republic of China was proclaimed at Peking (which under its old name again became the capital) with an elaborate constitution adopted by the People's Political Consultative conference of 636 delegates from 45 associations. Several of these were not Communist, a fact stressed by the Communists as evidence of the new government's truly democratic nature. At the head of this organization was the central people's government council with Mao Tse-tung as chairman and General Chu Teh (q.v.) as one of the six deputy chairmen; then the state administrative council with Chou En-lai as prime minister and minister of foreign affairs; then the People's Political Consultative conference to act as a consultative body until a National Congress could be elected by universal suffrage. The U.S.S.R. instantly recognized the new government (as did all her eight satellites), and exchanged ambassadors with it besides sending 200 technical experts for its assistance. A conference of Asian and Australasiain trade unions, assembled in Peking in November, under the chairmanship of Liu Shao-chi, member of the Politburo of the Chinese Communist party, indicated that Communist China would throw all her weight, morally at least, behind the Communist movement in southeast Asia.

On Oct. 2 Chou En-lai issued a general invitation to the powers to recognize Communist China "on equal terms." This question was keenly discussed in the autumn. It was agreed by all that the good behaviour of the Red troops could not be bettered, that the Communists' administration was clean and more capable than the Kuomintang's, and they had repeatedly promised full respect for foreign rights.

An interesting feature of their proclamations was that whenever necessary and possible "patriotic capitalists" should be tolerated and allowed their profits to encourage them to use their brains for China's benefit.
Foreign business-men in China and missionaries were urgent for early recognition in order to keep touch with the Chinese people and not to drive them deeper into Soviet arms. But on Nov. 16 Ernest Bevin indicated in the House of Commons his preference for "acting together with the Commonwealth and other friendly governments." No British consuls, however, were withdrawn from China and the ambassador himself only left "on home leave" at the end of October, while British merchants were encouraged to stay for the maintenance of Britain's large interests in China.

After the publication on Aug. 5 of Dean Acheson's white paper on the United States' failure either to support the Kuomintang or bring about peace, U.S. policy in China seemed to be in a vacuum. All its representatives were withdrawn; the last of them, A. Ward consul at Mukden, was arrested on Oct. 29 on a charge of beating a coolie.

On Nov. 28 the Chinese delegate in the United Nations general assembly moved for non-recognition of Peking and condemnation of Soviet interference. The assembly, however, adopted for discussion a much more non-committal resolution.

By the autumn the British government devoted itself to building up Hongkong's defences against possible attack and by the autumn these had been raised to 25,000 troops and a considerable fleet and air force. The ancient Portuguese colony of Macao increased its garrison to 6,000. No incidents, however, were reported at the end of the year, during which Hongkong had developed a considerable barter trade with the Communist areas.

On Dec. 8 the Chinese government, by now consisting of only three or four ministers, announced its removal from Chengtu in Szechuan (to which it had retreated from Chungking) to Taipei in Formosa. On Dec. 11 General Lu Han, governor of Yunnan, joined the Communists, thus opening the way for them, via the famous Burma road, to the centre of the Burmese Communist rebels. The island of Hainan in the Gulf of Tongking was still held, but in China no vestige of Nationalist government remained. On Dec. 19 the Formosa government announced that the mouth of the Yangtze was being mined and ships were warned against trying to break the blockade of Shanghai. The "Flying Arrow," a U.S. ship, in trying to do so was heavily shelled and rendered incapable.

On Dec. 29 President Truman was reported to have decided to send military advisers to stiffen the morale of the troops in Formosa and save it from the Communists. This unexpected departure from the general policy agreed upon between Acheson and Bevin in September was apparently due to pressure by the Republican leaders and the effect on the strongly anti-Communist feeling in the United States if Chiang Kai-shek were not helped. But the Republicans overplayed their hand and a week later Truman stated positively that no advisers were to be sent. At the same time, however, some joint Anglo-American plan for building up southeast Asia as a stronghold against Communism was forecast and Acheson stated that the U.S. had no intention of recognizing the Chinese Communists for the present.

These uncertainties of American policy in Formosa (which naturally drew a blast of vituperation from Peking) caused some confusion in London, the British government having eventually decided, before Christmas, to recognize the Communists. The unanimous recommendation of British far eastern ambassadors and administrators at the Singapore conference clinched the matter. The recognition was announced on Jan. 6, 1950, and India, Pakistan and Ceylon recognized the Chinese government about the same time. The Commonwealth was thus split on the subject, as Canada, Australia and New Zealand decided to wait. The

The main entrance to the city of Peking decorated with portraits of Mao Tse-tung (right) and General Chu Teh, at the time of the Chinese people's political consultative conference which met in Peking, Sept. 1949.
COMMUNISTS' reply was far from gracious and was accom-
panied in each case by an invitation to "send a representa-
tive to Peking to conduct talks on the whole matter." The
meaning of this phrase excited a good deal of speculation as to
what conditions the Communists might try to impose for
exchanging diplomatic representatives.

That the fanatical pro-Soviet group was predominant in
Peking was clearly shown when Mao Tse-tung, who had mos
for Stalin's birthday on Dec. 21 and was to stay there for some
weeks, presumably to discuss the Soviet Union's position in Man-
churia on which its recovery of the railway and chief ports
through the Yalta agreement had given it a powerful grip.

There were, however, signs that the Communists were not
free from trouble. The autumn harvests in north China were
bad and shortage of food was accentuated by the Soviet
Union's demand for grain in payment for various supplies it
had promised to Manchuria. Peasant risings against high
taxation and living costs and shortage of consumer goods in
Anhui and south Manchuria had, on the Communists' ad-
mission, given some trouble. Serious inflation had set in:
the People's bank dollar, fixed at 900 to the £ when the
Communists took Shanghai, had fallen to 24,000 by
December. In south China all business was done in Hong-
kong dollars, the market rate for which was about PB58,000 to
HK$1, against the official rate of PB5600. These facts
indicated the Communists' want both of treasure and foreign
exchange.

  Relations with China (Washington, Aug. 1949).

CHOU EN-LAI, Chinese politician (b. Huaijan, Kiangsu, 1898),

- descended from an old mandarin family. Educated at a secondary school in Tientsin, he went to Japan in

- 1917 and studied at Waseda university for a year and a half. He returned to China in 1919, but the next year went to

- France under the Mao Tse-tung worker-student plan. Having

- spent some time in Great Britain and a year in Germany he

- returned to China in 1924 and joined the Chinese Com-

- munist party as secretary of the Kwantung provincial com-

- mittee. He took part in the Nanchang uprising (1927),

- was captured there by the Nationalists but escaped. He went

- to Moscow as a delegate to the 1928 congress of the Comin

- tern and remained there until 1931 studying at the Chungshan

- university. Back in China, he joined the Kiangsi Com-

- munist republic and in 1934-35 took part in the "long

- march" to Yenan. He revisited Moscow in 1935 as delegate

- to the Comintern congress. In Dec. 1936, when Chiang

- Kai-shek was kidnapped at Sian, Chou was largely responsible

- for his release. During World War II he served as minister

- of foreign affairs of the Yenan government and from May

- 1944 to early 1945 took part in negotiations with Chiang,

- but no agreement could be reached. Chou was again the

- Communist representative at talks in 1946 with General

- George C. Marshall who, as President Truman's special

- envoy, sought to establish peace between the two Chinas. When

- in 1949 the Communists extended their control over most

- of China, on Oct. 1 Chou was appointed in Peking as

- chairman of the state administrative council (prime

- minister) and foreign minister of the new Chinese people's

- republic. On Jan. 20, 1950, he joined Mao Tse-tung in

- Moscow for the final stage of negotiations which ended on

- Feb. 14 with the signature of a 30-year treaty of friendship,

- alliance and mutual assistance between China and the Soviet

- Union.

CHRISTIAN DEMOCRATIC MOVEMENT.

There was little sign during 1949 of any attempt among

- the parties in the different countries of western Europe that

- are loosely classed together as Christian Democratic to

- associate themselves more formally in an international move-

- ment. Indeed, those working in this sense were on the whole

- less active than in the year before; less was heard, for in-

- stance, of the Nouvelles Equipes Internationales, which held

- two international conferences during 1948 and none during

- 1949. The reasons for this were two-fold. In the first place,

- members of the Christian Democratic parties are in most cases

- (although not necessarily) practising Christians and usually

- Catholics, linked together by the supra-national nature of

- institutional framework and correspondingly less need of an

- international machinery for their contacts than are the

- members of the secular parties. And in the second place the year

- 1949 saw great progress towards the political and economic

- integration of western Europe as a whole, with a leading

- part being played by members of the Christian Democratic parties,

- partly because in so many cases theirs were the majority

- parties and in governmental office and partly because the

- idea of Western Union is more familiar and congenial a priori

- to Catholic and Christian minds than to others. So it was

- that at the Council of Europe (q.v.) at Strasbourg in August

- men like Georges Bidault, newly elected chairman of the

- French M.R.P. (Mouvement Républicain Populaire), and

- Maurice Schuman, also of the M.R.P., or like Ludovico

- Montini and Stefano Jaccini of the Italian Democratcians,

- not only took a prominent part but were constantly in

- consultation together, as members in a de facto international

- movement, bringing their combined influence to bear more

- effectively than did, for other instances, the Socialists and the

- Liberals.

Bidault became prime minister of France in October, and at

- that time, when Dr. Konrad Adenauer, of the Christlich-

- Demokratische Union, had become chancellor of the new

- federal German republic and Gaston Eyskens had become

- prime minister of Belgium as a result of the summer's elec-

- tions, it was easy to see that, over the western continent as a

- whole, the Christian influence in public life had continued to

- increase. In Belgium, on June 26, when the Parti Social

- chrétien confirmed its position as easily the strongest party in

- the country, the "royal question" overrode, however, the

- larger issue of ideology. That larger issue was best

- reflected, so far as the elections of 1949 were concerned,

- in Germany and Austria. When the western zones of Germany

- went to the polls on Aug. 14 to elect a parliament for the new

-
federal German republic, the Christian Democrats again showed themselves to be the largest and strongest party in a contest with the Social Democrats. And in Austria, on Oct. 9, the Volkspartei, although losing some seats to new groupings, remained comfortably the strongest party. (See also ELECTIONS.)

The year was marked by a number of international conferences on social matters, as distinct from political matters in the party sense, under the auspices of Christians of whom many had become associated with the Christian Democratic parties. Of these may be mentioned in particular the International Christian Social association, which during 1949 set up an international secretariat in Brussels and held a highly successful conference, the third in annual succession, in that city in October, both outcomes of the meeting at St. Gall, Switzerland, in Feb. 1947. It is relevant also to note the growing strength of the Young Christian Workers (Jeunesse Ouvrière Chrétienne: Christliche Arbeiterjugend) for whom 1949 was a silver jubilee year. The international Catholic university movement, Pax Romana, again, also outside the field of party politics, had a successful year, with a large international conference of students, the first of an annual series, held at Fribourg, Switzerland, in August. It should be stated in connection with all such activities that, although they were Christian and non-political, yet they were bound to be to some extent concerned in politics, and were bound in doing so to come into close relationship with the Christian Democratic parties, whenever ideological elements were found in political life; and it was precisely because of the existence of a wide range of such flourishing international movements that there was no need for any international cultural organization to be specifically associated with the Christian Democratic parties as such. (M. Dk.)

CHRISTIAN SCIENCE. Christian Science is a religion founded by Mary Baker Eddy and represented by the Church of Christ, Scientist, made up of the First Church of Christ, Scientist, in Boston, Massachusetts, known as the Mother Church, and approximately 3,000 branches located throughout the world. There were also in 1949 more than 100 college and university Christian Science organizations formed in accordance with the by-laws of the Mother Church.

The Christian Science Church, which in 1948 purchased a large building in Washington, D.C., for the use of its Committee on Publication, opened in the building an exhibit officially called Christian Science World Activities on Display. The exhibit unfolded in chronological sequence the history of the Christian Science movement and included many unique features of architecture and display.

The Wartime Activities committee of the Mother Church continued in 1949 to help those facing the aftermath of World War II. Substantial quantities of food and clothing were supplied for distribution in Europe and elsewhere. Christian Scientists in the United States, Canada and England, interested in helping displaced persons to leave Europe and make new homes for themselves in other parts of the world, were aided by the Wartime Activities committee. The work of the Christian Science Camp Welfare Activities at military and naval stations doubled during 1949. The Mother Church maintained 56 paid camp and hospital workers. In addition there were 214 volunteer workers who donated their services. Four Christian Science chaplains were assigned to stations with U.S. forces in Germany. Full legal recognition for Christian Scientists to practice Christian Science and charge for their services was granted through legislation enacted in 1949 in Ohio, the last state in the U.S. to pass such a law. Publications of the church, which are issued by the Christian Science Publishing society, include the Christian Science Journal; Christian Science Sentinel; Christian Science Quarterly; the Herald of Christian Science, published in seven languages and in Braille in English; and the Christian Science Monitor.

Transcribed radio programmes, originating in the Mother Church, were broadcast over more than 450 stations in the United States and territories, Canada, Panama, Cuba, Bermuda, New Zealand and Australia. It was estimated that there were 10 million listeners to these programmes each week. (W. D. K.)

CHURCHILL, WINSTON LEONARD SPENCER, British statesman (b. Blenheim palace, Oxfordshire, Nov. 30, 1874). For his career see ENCYCLOPEDIA BRITANNICA and Britannica Book of the Year 1949. After the defeat of his government in the general election of July 1, 1945, he led the Conservative opposition in the House of Commons.

He attended the European Movement congress in Brussels in Feb. 1949 and on March 31 he spoke at the mid-century convention of the Massachusetts Institute of Technology.

His survey of technological and political developments in the first half of the 20th century was considered by some to have been as important as his speech at Fulton on March 5, 1946. From that speech the movement for European unity and the Council of Europe grew, and in August he led the Conservative members of the British delegation at the first European assembly at Strasbourg. On Aug. 12 he addressed a large crowd in the Place Kléber, where he was received with tremendous applause, and three days later was presented with the honorary citizenship of Strasbourg. After the announcement...
of the devaluation of the pound on Sept. 18 he called
for the summoning of parliament, and in the special debate
that followed he moved a motion of no confidence in the
government and again demanded a general election. On Feb. 3
he received in the Guildhall, London, the Grotius medal, a
Dutch award for distinguished services rendered in the cause
of international peace or international law. He received the
freedom of the royal borough of Kensington on June 1 and
on Sept. 29 the municipal council of Cannes elected him an
honorary citizen. In May he received the honorary degree of
doctor of law from Liverpool university. On June 27 the
second volume of his memoirs of World War II was pub-
lished—for this and the first volume he was awarded the
Sunday Times £1,000 prize for literature for 1948-49.

CHURCH MEMBERSHIP. No accurate compara-
tive figures can be given because no common basis of
calculation is observed by the Churches. The figures for
the Church of England and Church of Scotland included
the returns for electoral rolls, Sunday schools and infant bap-
tisms; in addition the nominal adherents of the Church of
England amounted to at least three times this figure. Sunday
school membership was included for all the other churches
with a few exceptions which are noticed.

**CHURCH MEMBERSHIP—CHURCH OF ENGLAND**

- **ENGLAND AND WALES**
  - Church of England (effective) .... 5,469,629
  - (nominal) 15,000,000
  - Church in Wales (estimated) .... 250,000

  - Baptists 8,852
  - Congregationalists 4,151
  - Friends (adults) .... 1,968

(A. J. MAC.)

**CHURCH OF ENGLAND.** The most striking event
during 1949 was the mission in the diocese of London (May).
No previous home mission had ever been so carefully
organized, not only amongst the clergy and parishes of the
diocese, but by means of the press and radio. A remarkable
feature was the widespread use of lay missioners who sup-
ported some 150 clerical missioners commissioned by the
bishop in St. Paul's cathedral on May 14, when three pro-
cessions of the robed clergy of the diocese marched to the
cathedral from three city churches. In the city itself the
mission began on May 11 with a great meeting in Guild

**Hall with the bishop in the chair. Some 600,000 people
attended services and meetings in churches, halls, factories
and on open-air pitches all over the diocese, and also lunch-
hour services in the city. The Queen was present at the first
evening meeting at St. Paul's. Great services of thank-
giving were held at St. Paul's, Westminster abbey and South-
ward cathedral. In October a two-day conference was held
at Ashridge to arrange for a follow-up.**

On June 19 the fourth centenary of the publication of the
Book of Common Prayer was celebrated in cathedrals and
churches throughout the land. A picture paper, entitled
*Your Prayer Book*, was issued by the Society for Promoting
Christian Knowledge in an edition of 150,000 copies. The
great door of Liverpool cathedral was opened by Princess
Elizabeth, accompanied by the Duke of Edinburgh, on
March 19. It is at the south side under the great central
tower and is approached by 32 steps. The work on the
building of Guildford cathedral also continued. The Interim
report of conversations between representatives of the
archbishop of Canterbury and of the Free Churches was pub-
lished on March 31, signed by A. E. J. Rawlinson,
bishop of Derby, and Dr. Nathaniel Micklem. It recorded
complete agreement on the apostolic faith contained in the
scripture and the creeds, and substantial agreement on the
doctrine of the church and the function of the ministry.
The function of the episcopate and other questions remained
to be discussed. Further conversations took place at Oxford
in September. A scheme for the re-organization and amal-
gamation of the city churches was published in July. It allowed
for the retention of 15 of the churches as parish churches,
to be open for Sunday services, and for pastoral work among
the resident population in the city as well as for existing
lunch-time activities; and 21 "ward" churches were also
retained, mainly for lunch-time work, thus leaving the incumbents free for Sunday duty and specialized evening work elsewhere in the diocese. The revenues of the benefices were to be centralized in a common fund and fixed stipends were to be paid to the rectors and vicars of ward churches. A single board of patronage for the city churches was suggested.

Convocation. The archbishop announced that subsequent editions of the Shorter Prayer Book would be issued with the title "The Shorter Prayer Book," being an abbreviated form of the Book of Common Prayer, with some additional matter. No constitutional question had been raised by the publication of this book and there was no constitutional obligation on the part of the bishops to consult convocation about its issue. A committee was appointed to consider the Lambeth resolutions concerning the Church of South India. Three clergy were appointed to serve on the Provincial Appellate court set up by the Incumbents (Discipline) measure, 1947. Revision of the canon law was continued by both the convocations of Canterbury and York. The subjects dealt with in 1949 were: church festivals; the vesture of the clergy; the conduct of divine service and time of service in cathedrals and parish churches; the Holy Communion; sermons, the bidding prayer, hymns, anthems and church music; Holy Baptism. The York convocation also considered the canons on the marriage service; communion and unction of the sick; burial of the dead; registration of baptism, confirmation, marriage and burials; and divine service in places outside the church. In Oct. 1949 the archbishop of Canterbury addressed convocation on the welfare state; and discussion took place on the second Interim report on baptism, confirmation and Holy Communion, and also on a set of rules to be observed by lay members of the church.

The Church Assembly. The Benefices (Suspension of Presentation) measure, 1946, (Amendment) received final approval by the Church assembly. The Re-organization of Areas measure, 1944, (Amendment), restricting the rights of patrons in certain areas, was extended until 1954. Some other measures received general approval; and it was agreed to drop from the Bishops' Retirement measure certain clauses concerning doctrine, ritual and ceremonial, leaving these matters to be dealt with by the convocations in the revision of the canons. The reports of several committees were received. It was agreed that the Report on Lay Evangelism be referred to the convocations, diocesan and rur-decanal conferences and parochial church councils; the two archbishops were asked to invite the diocesan bishops to appoint a Sunday on which to collect the £40,000 required to train candidates for the ministry accepted in 1949; the diocesan boards were to be asked to raise £450,000 for church training colleges for teachers. The Church commissioners reported that since they administered 800,000 ac. of glebe they could not take over glebe distributed in small parishes all over the country and they advised the sale of glebe where its retention was no longer economical. The suggestion was made that the Ministry of Works should take over disused churches of historical interest. The suggested rules for observance by the laity were welcomed by Sir Eric Maclagan, especially that which urges regular church attendance on Sundays. A commission was appointed under Sir Walter Moberly to draw up resolutions on the relations between church and state, and a council on Oecumenical Co-operation was appointed to maintain relations with the World Council of Churches (g.v.) and the British Council of Churches.

No less than seven new appointments were made to the episcopate. Two notable biographies appeared, that of Cosmo Gordon Lang, by J. G. Lockhart, and of Winnington-Ingram by the dean of Exeter. (See also Anglican Communion; Church Membership; Missions, Foreign Religious.)

CHURCH OF SCOTLAND. Through its communicant membership of 1,263,423 and its ministerial charges numbering 2,377, the Church of Scotland in 1949 continued to influence the life and affairs of the Scottish people. It again authorized the maintenance of its foreign mission work in all existing fields and appealed confidently for an increase in donations to realize the sum of £240,000 during the year for this work. Through its Churches Overseas department it expanded its work in the Commonwealth and at its continental stations and gave considerable aid to the scheme for the reconstruction of the evangelical churches in Europe. Its Jewish Mission committee intimated that the work of the Church of Scotland would be resumed forthwith throughout Palestine, the Israeli authorities having given every facility for the restoration of properties and the resumption of work.

The general assembly of May 1949 heard with appreciation a report on the first assembly of the World Council of Churches (g.v.), held at Amsterdam the previous year, at which the Church of Scotland was strongly represented; and steps were taken to raise increased funds in support of the oecumenical movement through a Scottish Churches' oecumenical council. On the invitation of the archbishop of Canterbury informal discussions were initiated with regard to inter-communion and interchange of pulpits between the Church of Scotland and the Church of England.

During 1949 the Committee on Church and Nation took cognizance of problems arising in the life of the nation, and out of this concern for public questions there was submitted to the general assembly the report of the Special Committee on Re-Marriage of Divorced Persons, an important document which was to be considered by the Presbyteries of the Church and by the general assembly in May 1950.

Among other questions brought to the notice of the general assembly was that of the Christian doctrine of the "just war" and its bearing on the attitude of the church to war in the atomic age. Always mindful of the care of its youth, the Church of Scotland appointed a special committee on Christian action, charged with informing the minds of young
people in order that materialistic ideologies might be effectively combated. In Scotland itself the work of the Committee on Social Service, which had now no less than 12 "homes for the aged" under its supervision, and of the Home board engaged in the urgent task of church extension into new building areas was well done.

The moderator of the general assembly of 1949 was the Right Rev. George S. Duncan, St. Mary's college, St. Andrews'. The lord high commissioner during the assembly was the Duke of Gloucester. During the year the moderator of the general assembly of 1948, the Right Rev. Dr. Alexander Macdonald, visited various units of the British armed forces including the Scottish troops in the British army of the Rhine.

(T. C.)

CHU TEH, Chinese Communist army officer (b. Maanchuang, Szechuan, 1886), son of a peasant. In 1909 he entered the Yunnan military academy and led a company in the 1911 republican revolution. Five years later he was a brigadier general in the army of the Yunnan war lord Tang Chi-yao, who made him provincial commissioner of finance. In 1920, however, Chu abandoned his house and his family and joined the Kuomintang at Shanghai. Two years later, in Berlin, he met Chou En-lai (q.v.) and joined the Chinese Communist party. He studied at the Eastern Toilers' university in Moscow and returned to China in 1926, where a year later he directed an officers' training school at Nanchang. He led a revolt against Chiang Kai-shek (q.v.) who, in May 1927, broke with the Communists. Defeated, he fled to the mountains of the Fukien-Kiangsi border where, in May 1928, he joined forces with Mao Tse-tung (q.v.). A communist state was organized with Chu as commander-in-chief; but in 1934-35 came the "long march" to Yenan. Chu remained there for 12 years as c.-i.-c. of the Chinese Communist army. On Aug. 10, 1945, he ordered the army to move into Manchuria "to accept the surrender" of the Japanese and cooperate with the armies of the U.S.S.R. which had declared war on Japan two days previously. With Soviet support, Chu's forces expanded and, three years later, were able to start a big southern offensive. At Peking on July 17, 1949, Chu expressed satisfaction at being successful against "American imperialism and its watch-dog in China, the reactionary clique of Chiang," new China, he said, would march forward with the Soviet Union. On Oct. 1, he was appointed one of the six deputy chairmen of the new government of the Chinese people's republic and commander-in-chief of its armed forces.

CHUYKOV, VASILY IVANOVICH, Soviet army officer (b. Serbryaniye Prudy, Tula province, 1900). At the age of 12 he went to St. Petersburg (Leningrad) where he worked as errand boy at a bath-house and later at a saddler's shop. In 1922 he enlisted in the Red army after the October Revolution and after the civil war was sent to Frunze Military academy, Moscow. In 1941 he was Soviet military adviser in Communist China. As commander of the 62nd army he distinguished himself at the end of 1942 in the battle of Stalingrad. In 1943 he was promoted colonel general; two years later he was one of the first Soviet commanders to enter Berlin. After the capitulation of Germany he was appointed chief of the Soviet military administration in the Land of Thuringia. On March 30, 1949, he succeeded Marshal Vasily D. Sokolovsky as military governor and commander in chief of the Soviet zone of Germany.

CIGARS AND CIGARETTES: see TOBACCO.

CINEMA. The dollar shortage of most European countries during 1949 led to an uneasy situation in the film industry. Though it was natural that Hollywood desired to rebuild the lucrative markets in Europe which were temporarily lost during World War II it was equally natural that, in the difficult economic situation in Europe, any threat to home production resulting from an economic agreement which seemed to favour unreasonably the importation of films whose costs had already been met in America itself was keenly resented. Again, it was more expensive for the exhibitor to hire a British or a French film than to hire its American equivalent from the point of view of audience-appeal since the home-product had the whole of its costs to recoup.

The situation in France during 1949 was that French films must be shown 5 weeks out of the quarterly 13 and that American and British films must be "doubled"; i.e., have a new French sound-track synchronized, thus giving employment to French technicians. The Italians, too, were extremely skilful in dubbing foreign language films. In Western Germany, to take another example, the market was free and exhibitors chose as they pleased; there was always a demand for the few home-produced German films being made. In Great Britain, however, the economic situation reached the point of a major industrial crisis in 1949.

Against the background of these difficulties, since the film persistently remained a two-headed Janus looking alike towards the mountain-heights of art and the heavy seas of industry, production developed along many divergent lines. The eastern European countries maintained a solid front of production, sometimes of a distinguished nature. Soviet films, slow, dignified and strictly orthodox in their ideological structure, led the field to which Poland, Czechoslovakia and Hungary added proficient work. Yugoslavia, cut off from these former partners, was developing a new industry of its own. The work of these and the western European countries was very fully—many said far too fully—represented at the innumerable film festivals organized by several European countries. The eastern European countries held their festival in Mariánské Lázně in Czechoslovakia. The western European countries held festivals in Belgium (Knocke), Switzerland (Locarno), Italy (Venice) and France (Cannes). Two special non-competitive festivals of films in the documentary style were held in Hamburg, Germany, and, as usual, in Edinburgh. It was generally agreed that the increase in the number of competitive festivals, with their universal rule that different films must be presented at each, merely reduced the standard of the films which producers were able to submit. The winners of the Grands Prix were the British film The Third Man (at Cannes), the Italian film...
Orson Welles as Harry Lime in the sewers of Vienna in "The Third Man," a London film production, produced and directed by Carol Reed.

Bicycle Thieves (at Knocke), the French films Manon (at Venice) and La Ferme des Sept Péchés (at Locarno), and the Soviet production The Battle of Stalingrad (at Mariánské Lázně). Conferences of importance were also held during 1949 including those convened by the International Scientific Film association in Brussels, the International Federation of Film Archives at Rome and the International Federation of Film Critics at Cannes.

Great Britain. During 1948 the quota for British productions which must be shown in British cinemas was fixed by the president of the Board of Trade at 45%. This high quota, double that which had ever been in operation since the British quota was first instituted by law in 1928, was introduced more to save Britain's dwindling dollar reserves for such luxuries as film entertainment than to protect her film industry. The quota, which was reduced in March 1949 to 40% for the year 1949-50, was bitterly resented alike by the American producers and the British exhibitors. A further complication began to show itself during 1949. The supply of British films began to fail, for producers found that it was difficult to finance films which, although protected as far as exhibition was concerned by an artificially high quota, did not cover their costs even when they were reasonably successful with the public. Producers hastened to point out that, although they were the people who took the greatest financial risk in the making of the film, out of every £100 their work earned at the box office entertainments tax took about £40, the exhibitors another £40 and the distributors a further £10. Eventually therefore, the producer got some £10 for every £100 taken at the box office. His costs meanwhile remained very high and films costing from £200,000 to £500,000 were bringing back only £150,000 to £250,000 after an interval of one or two years. The studios began to close; and to assist the industry, the government created in Oct. 1948 a Film bank with a capital sum of £5 million from the Treasury to make loans, in most cases on a distributor's guarantee, to producers who could not otherwise finance their films privately. In April 1949, Lord Reith, well-known as the director-general of the B.B.C. from 1927 to 1938, was appointed chairman of this Film Finance corporation. Meanwhile the government set up a committee initially presided over by the late Lord Portal "to consider, against the background of the general economic situation in the film industry, the arrangements at present in operation for the distribution of films to exhibitors and their exhibition to the public in commercial cinemas, and to make recommendations." And a second committee, with Sir George Gaskin as chairman, to investigate costs of British production. In November J. Arthur Rank, Great Britain's senior producer and studio-owner, declared he had lost £3,500,000 in production ventures. He declared that Henry V, made in 1943 and first released in London in 1944, had only four weeks earlier succeeded in recovering the costs of its negative—that is, nearly five years after its initial release. In the same period it had contributed more than £400,000 in entertainments tax.

The situation at the close of the year, with the publication of the Gater committee's report as a government white paper in which past production extravagances were castigated, called for considerable retrenchment on costs among companies still at work. There was a general sense of grievance against the high levy of entertainments tax and some anticipation of government action to alleviate the problems of this small but troubled industry.

In spite of these economic difficulties Great Britain managed to produce during 1949 some films worth attention in any year. There was no British school, in the sense that the new Italian realist films could be said to constitute a school or genre of film-making. At one time, during the middle years of World War II, it seemed likely that there would be a realist school in Great Britain but, apart from certain films made at Ealing Studios, the virtues of British production could be seen to lie in the highly individualistic styles of film-makers like Carol Reed, Thorold Dickinson or David Lean, working on films of a very different kind in each case. Ealing Studios, under the supervision of Sir Michael Balcon, produced a new series of comedies which certainly had something of the common style—including Kind Hearts and Coronets (Robert Hamer), Whisky Galore (Alexander MacKendrick) and Passport to Pimlico (Henry Cornelius). Charles Frend's Scott of the Antarctic in colour was a great prestige success, but Harry Watt's second Australian film, the historical Eureka Stockade, was something of a disappointment, largely because of its poor acting.

Another well intentioned realistic film which failed in part to survive the test of scripting and acting was Blue Scar (Jill Craigie), a film set and produced in a Welsh mining village. Two other films also in the realistic style were Give us this Day (Edward Dmytryk), remarkable for its reconstruction of Italian life in New York, and The Small Back Room (Michael Powell and Emeric Pressburger) based on Nigel Balchin's novel of civil service research work during World War II. Films which had success during the year...
and which were based on novels and plays included The Guinea Pig (John and Roy Boulting), The History of Mr. Polly (John Mills), The Passionate Friends (David Lean)—both the latter derived from novels by H. G. Wells—and Quartet, based on four stories by Somerset Maugham. The most discussed films of the year were Thorold Dickinson's period piece The Queen of Spades and Carol Reed's The Third Man, which gained the Grand Prix at the Cannes Film festival.

These films, produced during the past two years but shown mainly during 1949, proved that Great Britain was capable of producing a small output of important pictures each year. Unfortunately a far greater number of poor quality films were also released and the result was that the box office demand for British, as distinct from American, films tended to decline. This could only be rectified by a revival in quality as distinct from quantity in British production. In the branch of documentary production, more particularly in the specialized technical and scientific films, Great Britain remained outstanding, as was shown by the many awards to British productions given at the Venice festival. Many films, notably Daybreak in Udi, Atomisation, Cornish Engine, Turbo-jet propulsion, Digestion, Growing Girls and the historical compilation The Peaceful Years, kept the standard of factual film production high.

Commonwealth. Apart from the large output of commercial feature films in India, documentary production was the most important work done in films in the Commonwealth. India, Australia, New Zealand and especially Canada were all consistently producing factual films under government sponsorship. Outstanding Canadian documentaries dealt with psychology and health; Drug Addict and Over-Dependency were particularly good; others dealt with education, notably Children's Concerts on the teaching of musical appreciation. Norman McLaren continued his gay experiments in abstract animated films in colour painted straight onto the celluloid and set to jazz music. The Australian National Film board's chief contribution during 1949 was the over-long but excellently shot The Valley is Ours, a film about the Murray valley and its economic and agricultural problems. An important fact was that during 1949 the Shell Film unit established a branch production unit in Australia to produce technical and scientific films in the Pacific. In India the government-sponsored organization, Information Films of India, which had been disbanded in 1946, was revived and extended in 1947 as the Films division of the government of India. This organization produced newsreels and documentaries for both theatrical and non-theatrical exhibition; the languages used were English, Hindustani, Tamil, Telugu and Bengali, and the subjects were political, social and cultural.

Czechoslovakia. After the success of the Czech war films in 1946-47, the unique work of her cartoon and in particular her puppet films attracted international attention. The chief technicians of the puppet films were Jiří Trnka and Boživoj Zeman; some of the latter's recent films used examples of the glass figures for which another industry in Czechoslovakia is famous. Among recent feature films were the war subjects The Ghetto Terezin (Jiří Weiss) and The Silent Barricade (Otakar Vavra). The large studios of Barrandov near Prague were being enlarged so that the objective of the production of over 50 feature films a year could be realized by 1953, together with regional productions emanating from Slovakia.

France. French producers were faced with similar economic disadvantages as their British colleagues, though they never allowed their costs to rise to a level equal to the costs of British productions. They had, therefore, been able to continue production on the same scale as in 1948, that is, at a level about two-thirds that of the prewar output. Artistically speaking, it could not be said that France occupied the inevitable resentment. Jean Devaivre made a technically interesting mystery film, La Ferme des Sept Péchés, and Louis Daquin produced a socially healthier film called Le Point du Jour, photographed in the realistic setting of the French Liévin mining area. The most controversial film of the year was H. G. Clouzot's Manon, which, in spite of winning the Grand Prix at Venice, met with considerable censorship difficulties in several countries through its handling of a modernized version of the Abbé Prévost's story. Other films of interest included Les Parents Terribles (Cocteau), Rendez-vous de Juillet (Becker) and Au Royaume des Cieux (Duvivier).

Germany. In 1949, Germany was reviving its film production under the complex and varying administrations imposed by the different occupying powers. The cinemas were well attended and on the free market of Western Germany British and American films were popular with exhibitors and audiences. The best facilities for film-making were in the Russian and American zones. The films most popular with audiences were understandably films of escape and the more recent examples of subjects which still reflected a wartime or postwar consciousness of defeat did not draw audiences. Berliner Ballade (R. A. Stemme and Günther Neumann) satirized German self-pity to some extent, while Liebe '47 (Wolfgang Liebeneiner) stressed it. Other films dealing in various ways with social themes were Die Bunkarierten (Kurt Maetzig), Pit "Aurora" (W. Schleif
and E. Freund). The Blum Affair (Erich Engel) and The Call (Josef von Baky).

Italy. For how long Italy, with the advantage of her comparatively low production costs, would be able to continue to give directors such as Roberto Rossellini (q.v.), Vittorio de Sica, Alberto Lattuada and Luigi Zampa freedom of subject and style was debatable. Italian audiences, like those elsewhere, preferred romantic films to those realistic subjects which gave Italy a world-wide reputation after World War II. Many of these now well-known films were produced at a cost of little more than £20,000 to £30,000; i.e., at a rate less than one-sixth what their production cost would have been in Great Britain or America. There was no doubt that freedom of subject and treatment as exemplified by the Italian cinema was closely related to this low production cost; were this condition to disappear these films could probably not be made. In the same way, the fine films on Italian art made by Luciano Emmer could be made because the overhead expenses involved were small.

Vittorio De Sica's simple and beautiful film, Bicycle Thieves, the story of a day in the life of an unemployed man and his son, led Italian realism producer for 1949. Lattuada's Mill on the Po, dealing with the Italian agrarian labour trouble of the 19th century, was also important. Roberto Rossellini worked during the year on two films, Terra di Dio with Ingrid Bergman and La Macchina Ammazzacattivi, a satiric fantasy set in Amalfi. M. Camerini's Moli Sogni per le Strade, with Anna Magnani (q.v.), was in a lighter style and two good melodramas were Giuseppe de Santis's Bitter Rice and Pietro Germi's In the Name of the Law.

Poland. Poland had been building up her film industry since 1944. By 1949 she had already achieved a fine school of documentary films as a part of her nationalized industry, but her ability to make important feature films was now also established. The Last Stage was a completely convincing reconstruction of life in the women's concentration camp of Auschwitz, Poland, directed by Wanda Jakubowska; Robinson Warsaw (Jerzy Zarzycki) dealt with the lives of a number of Warsaw citizens during the destruction of the city by the Germans; while Truth Knows no Frontiers showed the martyrdom of the Polish Jews in the Warsaw ghetto.

Scandinavia. As film-producing countries, Denmark and Sweden were far ahead of Norway, which had only the smallest output of films in the documentary style. Whereas Denmark specialized in documentary production under state subsidy similar to that of Great Britain, Sweden concentrated mainly on commercial feature films, a few of which were shown widely in other countries. The new directors of importance who emerged from these countries were Bjarne Hennings-Jensen of Denmark and Arne Sucksdorff of Sweden. The former was noticeable for his handling of children and adolescents in his sensitively photographed films; the latter was an experimentalist in subjects involving location work and carefully contrived rhythms.

U.S.S.R. Production in the U.S.S.R. had still not fully recovered from World War II and the number of feature-length films produced remained comparatively small. Among recent films of merit were, Academician Pavlov (G. Roschal), Lenin (M. Romm), The Battle of Stalingrad (V. Petrov), Young Guard (S. Gherasimov) and The Village Teacher (M. Donskoy). Lenin was a well-made historical compilation including a number of extracts from the "classical" silent films of the 'twenties. The others included well acted, realistic reconstructions of the life and work of famous Soviet scientists and of Joseph Stalin's conduct of the defence of Stalingrad. Soviet animated films, notably The Little Hunchback Horse and A Tale about a Soldier, were shown at the Edinburgh festival with great success: both had a distinct style and sense of design.

Yugoslavia. Yugoslavia was determined to establish an important film-industry representing her six republics: Slovenia, Serbia, Croatia, Bosnia and Hercegovina, Macedonia and Montenegro. Work started on an organized basis in 1945 when a Federal Film commission was founded and 1947 saw the establishment of a training school for film technicians, the full course taking three years. The three branches of film-making, newsreel, documentary and educational films, and feature films, were all well developed; by the end of 1948, 200 newsreels, 120 documentaries and 14 feature films had been completed. The enthusiasm of these new film-makers overshadowed their early technical inadequacy, and more recent films such as Sofka, which was shown with success at the 1949 Edinburgh Film festival, indicated, in spite of some slowness, a fine feeling for period and regional custom. Most Yugoslav film subjects, however, were still concerned with World War II as it affected Yugoslavia; and the documentary film-makers were closely concerned with using the cinema to develop educational work with the more illiterate sections of the country.

United States. In 1949 the outlook of the U.S. motion picture industry brightened perceptibly both at home and abroad. In neither instance were the results immediately convertible into cash profits, their chief value lying in the industry's psychological reactions.

One factor was especially responsible for the improved outlook: the success of the effort to decrease production costs without sacrificing the quality of the product.

The industry's morale may be said to have reached its lowest point in Feb. 1949, when only 22 pictures were under production in Hollywood, compared with a normal figure of nearly twice that number. Then a reaction set in, which was reflected both in the statements of industry leaders and in studio announcements of future productions. In terms of employment, the swing to a more optimistic viewpoint may be measured by the number of employees in the industry—12,000 in February, increasing to nearly 15,000 at the end of 1949.

The industry had settled down to the task of reducing production expenditure. Under the sponsorship of the major studios, the Motion Picture Research council undertook continuous laboratory and experimental work. One development, a stripplable adhesive for wallpaper used on film sets, resulted in a yearly saving of $40,000 per studio. Reduction in production costs generally was estimated at 20% to 25%.

Box-office returns for 1949 were estimated at $1,375 million. The net profit estimate for seven major companies was $55 million, about the same as in 1948. Studio financial reports generally showed profits, though not always equal to those of 1948.

In the world market situation, the U.S. industry was still beset by restrictive regulations and dollar shortage. Predictions of a drastic cut in returns from abroad did not come true, however, and the 1949 foreign revenue of the distributing companies was estimated at 38% of gross film rentals, only a slight reduction from 1948. As their principal method of obtaining value from frozen funds, U.S. companies greatly expanded their foreign production activities. Italy, in particular, became a focal point for such operations, though England continued to get its share of attention from U.S. producers. Several important pictures, such as Stromboli and Deported, were filmed in Italy during the year.

The devaluation of the pound, followed by similar currency action by countries in the British economic orbit, decreased the value of blocked funds of U.S. film companies and of their potential future earnings.

At the end of 1949 the long U.S. government anti-trust
action which sought to divide exhibition from producer-distributor interests had not reached a final settlement. However, Paramount followed RKO in arriving at a consent decree embracing such terms. Warner Bros., Loew's (Metro-Goldwyn-Mayer) and 20th Century-Fox continued to seek some mitigation of the demand for independent ownership of production-distribution interests and the exhibiting cinemas.

Two producing companies fell by the wayside during the year. Beset by financial difficulties, Eagle-Lion Films suspended production indefinitely at its Hollywood studios after about four years of operation. The company, officials said, would continue in business but only as a distributor of films made by foreign or independent producers.

At about the same time, David O. Selznick, one of the industry's leaders for many years and generally regarded as one of its most distinguished producers, closed his studio and disbanded his producing organization.

Some competition was felt by film theatres in television centres, but not enough to register on a national scale. Film companies conducted experiments with large-screen theatre television. Late in 1949 Columbia announced a programme of short subjects for television.

The outstanding development in production trend in 1949 was concern with racial questions, following previous emphasis upon anti-Semitism. The situation of the Negro in the U.S. was dealt with in films such as Pinky, Intruder in the Dust, Lost Boundaries and The Home of the Brave.

A number of the year's pictures dealt with the war—Battle-ground, Twelve O'Clock High, The Hasty Heart, Task Force and Sands of Iwo Jima. Even the two highly successful comedies, I Was a Male War Bride and Francis, had war backgrounds.

Other outstanding productions were Jolson Sings Again, The Heiress, All the King's Men, Champion, They Live by Night, Samson and Delilah and The Stratton Story. Some of the outstanding musical productions were The Barkleys of Broadway, Dancing in the Dark and On the Town.

New faces which attracted the most attention on the screen in 1949 were Kirk Douglas in Champion (which also introduced a new independent producer, Stanley Kramer), John Derek, Mercedes McCambridge, Keefe Brasselle and Richard Todd. Broderick Crawford, while not a newcomer, was acclaimed for his work in All the King's Men.

The New York film critics made the following selections for 1949: best picture of the year, All the King's Men; best foreign-language picture, The Bicycle Thieves (Italian); best actress, Olivia de Havilland; best actor, Broderick Crawford; best director, Carol Reed, for The Fallen Idol (British).

Leading box-office stars of 1949, according to the annual poll of Motion Picture Herald, were Bob Hope, Bing Crosby (who had been first in the five preceding polls), Bud Abbott and Lew Costello, John Wayne, Gary Cooper, Cary Grant, Betty Grable, Esther Williams, Humphrey Bogart and Clark Gable. (L. O. P.)

Technical Developments. Colour. Several new colour films were introduced in 1949. The Ansco process was further developed and received additional commercial use. A complete line of film types was now available for all the necessary steps from the original taking film up till the "duping" and special effects steps to release prints.

Du Pont introduced a positive film for making three-colour prints from separation negatives. This film was notable for employing a synthetic polymer which combined the functions of the gelatine and the colour former usually employed.

Eastman introduced, on an experimental basis, a three-colour negative and positive film of the single film, triple emulsion type. Tests on these films were in progress in Hollywood at the close of the year. Both Eastman and du Pont continued experimenting with a negative film involving the use of three emulsions, two of which were subsequently stripped from the original base and mounted on new film bases in the laboratory before development.

Polarcolor corporation introduced and employed commercially for a limited number of three-colour cartoons a process using a standard single emulsion black-and-white positive film. It had to be printed in successive printing and developing processes from three-colour separation negatives, and resulted in a three-colour subtractive print.

Photography. Latensification, a system for increasing effective film speed involving a low intensity and a relatively long general exposure of the film immediately before development, was used considerably in 1949 as a means of reducing the cost of producing motion pictures.

A new portable camera, the Camrette, manufactured by Etablissements Cinématographiques Eclair of France, was introduced in Great Britain and Europe in 1948 and in the United States during 1949. This camera had some excellent operating features and was well received in Hollywood.

Sound. Magnetic recording was gradually being integrated into the production of motion pictures in Great Britain, Europe and the U.S. Its freedom from photographic printing and developing distortions, the possibility for somewhat smaller and lighter recording equipment and operating economies were factors stimulating its use.

A new miniature, non-directional condenser microphone and associated amplifier was introduced in Hollywood by the Altec Lansing corporation.

Safety Film. In the United States the low shrinkage safety base film of the tri-acetate type, introduced by Eastman Kodak, was received with considerable favour. It was currently used for release prints and studio work prints. There was some application as a sound recording negative and experiments were in progress to determine its adaptability to picture negative films. The Eastman Kodak company was said to be planning to discontinue the manufacture of all nitrate based films in favour of this new base.

Set Construction. There was considerable activity in the application of new plastic materials to various phases of set construction. These included breakaway glass, combinations of plaster and plastic, low-temperature thermosetting plastics for casting in ornamental objects of various types, lightweight tree trunks, building columns and many other similar applications. Strippable adhesive was used with wallpaper and temporary flooring such as linoleum or asphalt tile. In both
CIVIL LIST PENSIONS—CIVIL SERVICE

applications, this adhesive afforded the easy removal of the surface material.

A new photographic backing was introduced and was available in fairly large sizes, either black-and-white or in full colour. Its translucence permitted novel and realistic effects to be obtained by lighting from the back.

Theatre Television. Two systems of theatre television were being developed and were in limited commercial use—the instantaneous projection system and the film storage system. In the former, the television picture was projected from a special television receiving equipment directly on the motion picture screen. Installations of this type were made in theatres in Boston, New York and Philadelphia.

In the film storage system, the television picture was photographed on 35-mm. film from a special television receiving equipment located in the theatre. The film was processed on a high speed basis and could be projected through the standard theatre projection equipment a few minutes after the reception of the television picture. Installations of this type were made in New York city and Chicago, Illinois.

The U.S. Federal Communications commission conducted hearings on theatre television at which the Society of Motion Picture Engineers and two theatre chains were requested to present briefs. One of the chains presented a detailed plan for a network of approximately 25 theatres located in nine different cities. The proposal contemplated a special television network distributing special programmes staged for the purpose, public events of common interest and selected programmes also being televised for home reception. (W. V. W.)

CIVIL LIST PENSIONS. Under the Civil List act, 1937, the amount allowed to be granted in any one year was raised from £1,250 to £2,500, of which £1,600 was expended in the year to March 1949 on new pensions and £900 on increases to existing pensions.

New pensions were granted to: Mrs. Ruby Austen in recognition of the services rendered by her husband, the late John Austen, to art and literature (£200); Mrs. Ada Chesterton for services rendered by herself and her husband, the late Cecil Edward Chesterton, to literature (£250); Mrs. Constance Hassall for services rendered by her husband, the late John Hassall, to poster art (£100); Thomas Rowland Hughes for his services to literature (£200); Miss Marion McDonald for services rendered by her father, the late Rev. Dr. Archibald McDonald, to the history and literature of the Scottish Highlands (£150); Miss Nancy Price for her services to drama (£150); Mrs. Lilias Helen Morley for services rendered by her husband, the late Harry Morley, to art (£100); Miss Cicely Fox Smith, for her services to literature (£150); Mrs. Agnes Louise Stenhouse for services rendered by her husband, the late Ernest Stenhouse, to scientific research (£150); and Miss Ruby Wyld for services rendered by her father, the late Professor H. C. K. Wyld, to scholarship (£150).

CIVIL SERVICE. The twelve months to Oct. 1949 saw no important change in the main organization of the civil service in Great Britain. During the latter part of 1948 the development of the social insurance schemes resulted in further additions being made to the staff of the Ministry of National Insurance. At the same time responsibility for domiciliary assistance was transferred from local authorities to the National Assistance board which took over some 1,700 staff with the work. These measures were, however, more than counterbalanced by reductions over a large part of the civil service. The major contributions came from the trade and industrial departments which were able to make relaxations on controls and rationing. The Ministry of Labour was also able to reduce its numbers consequent upon a diminution in the work of resettling demobilized ex-service men. The net result of these changes was that the number of non-industrial staff employed in the civil service fell from 715,000 in July 1948 to 697,000 in Oct. 1949.

Recruitment. The Reconstruction competitions, designed to restore opportunities lost on account of World War II, came to an end and normal competitions, suitably modified to fit postwar conditions, were fully resumed. Besides the normal competitions to the administrative class by the two methods used in 1948, about 50 direct entrants were recruited to the Principal grade by means of a special open competition.

Recruitment to the executive and clerical classes from among those leaving school improved; and the first competition was held for university graduates to enter the executive class. The executive class competition for young men who had just completed their compulsory national service and the executive and clerical classes competitions for men and women who had served on regular engagements in the forces were also continued.

Establishment of Temporary Staff. Further progress was made with the process of establishing posts previously regarded as temporary. Under these arrangements 750 temporary executive staff became established and departments carried out the first part, covering 15,000 posts, of a scheme intended eventually to establish 34,000 temporary clerical posts.

Questions of Organization. Treasury Control of Civil Service Establishments. During 1949 the functions of the Treasury in relation to the control of numbers and grading in the civil service were re-defined. It was recognized that such control could be carried out with full efficiency only by the principal establishment and organization officers of each department (whose appointment and removal were subject to the approval of the prime minister) acting on behalf of the permanent secretary and accounting officer of that department. The responsibility and powers of such officers were accordingly increased and widened, notably by the delegation of greater powers to vary complements within maxima agreed with the Treasury at half-yearly intervals.

As a corollary the Treasury would now direct its attention primarily to the central control and scrutiny of the exercise by departments of their responsibilities in regard to numbers of staff and grading. The Treasury aim was to carry out once a year a comprehensive review of the numbers employed in each department. To this end Treasury officers, including specially selected staff inspectors, would make frequent visits to the departments, paying particular attention to the arrangements in force for control of complements and for staff inspection.

Organization and Methods. Increasing use was made of staff engaged whole time in the investigation of problems of organization and methods. The 18 largest departments continued to employ such staffs directly and the rest drew on a common pool in the Treasury. By the end of 1949 most departments had embarked on a planned review, that is the systematic overhaul of the department as a whole. The reviews were being undertaken in various ways. In some departments they were entrusted wholly to the organization and methods staffs; in others the direction of the review was in the hands of a committee which might include senior officials from other departments and personnel from outside the civil service with special experience in questions of organization.

Training. Much had been done since World War II to improve the arrangements for training staff. Training officers had been appointed in all departments and training was carried out both on the job and at organized courses which
included reception courses for new entrants and courses in the principles of staff management for those in charge of groups of staff. The Treasury exercised general control, gave guidance to departments on training and held central courses for certain kinds of staff.

Senior staff were selected for attendance at the Imperial Defence college and the Administrative Staff college and for paid leave of absence to study and travel. Programmes of study were also arranged for foreign officials visiting the United Kingdom.

Professional and Technical Classes. Considerable progress was made in carrying out in detail the broad plans of reorganization made during the years immediately after World War II, but the task was by no means finished: the scarcity of qualified people made recruitment difficult and delayed the work of reorganization. Two new classes were formally instituted: one, of psychologists, employed to classify the abilities of recruits to the civil service, of members of H.M. forces and, by the Prison commission, of certain convicted persons; the other, of information officers, whether employed as public relations officers and in the press offices of departments, or in the technical and creative divisions of the Central Office of Information.

Miscellaneous. Superannuation. The Superannuation act, 1949, made some important changes. The civil service secured a pension scheme for widows and orphans and certain dependants. The act provided for the widow or adult dependant to receive a pension of one-third of the civil servant’s pension should he die after retirement or one-third of his accrued pension should he die in service; this pension being augmented by one-quarter for each orphaned child up to four. If there was no eligible widow or adult dependant, a proportion of the sum which would have been payable to the widow was paid to any orphan or dependent child, the proportion ranging from one-half for one child to the whole pension for three or more. The pension scheme for widows and dependants was contributory, the civil servant’s contribution being estimated to pay approximately half the cost of the benefits. The widows’ scheme was optional for existing civil servants but compulsory for future civil servants; the dependants’ scheme was optional for both existing and future civil servants.

The act also enabled civil servants to retire after the age of 50 with a right to draw deferred pension on reaching the normal retiring age of 60; and to earn additional pension should they continue to serve after reaching the age of 60.

The Chorley Report. The government accepted the recommendation of the Committee on Higher Civil Service Remuneration (Cmd. 7655, H.M.S.O., London). The committee recommended substantial increases in the salaries attaching to the senior posts in the service—an increase, for instance, of £1,000 on the salary of £3,500 then paid to the permanent heads of major departments. They based their findings on the long-standing under-payment of senior civil servants which in their view had existed since the early 1920s and had been accentuated since World War II by the salaries paid in the new nationalized industries. The actual introduction of the new salaries, originally due to begin in Oct. 1949, was deferred owing to the worsening of the economic situation and the need for stabilizing wages and salaries generally.

The Masterman Report. The year 1949 also saw the publication of the report of the Masterman committee on the Political Activities of Civil Servants (Cmd. 7718, H.M.S.O., London). The fundamental problem before this committee was to reconcile the claims of civil servants to the right to participate in politics and to exercise in as full a manner as possible the rights and duties of citizenship with the desirability of maintaining the traditional political impartiality of the civil service. The broad effect of the committee’s recommendation was to grant complete political freedom for the first time to some 450,000 members of the industrial classes and of the minor and manipulative grades (mainly in the post office) while leaving some 450,000 members of the office grades from typists to senior administrative subject to the existing limitations. The government accepted the report but for the time being it was only being put into effect to the extent to which its recommendations conferred freedom from restrictions on the industrial classes and minor and manipulative grades.

(E. E. Bs.)

CLASSICAL STUDIES. It was still too soon to estimate the effect on classical studies in Great Britain of the new regulations for school and matriculation examinations; but the position of Latin seemed to be fairly secure, especially in view of the requirements in Latin still demanded by Oxford, Cambridge and some other universities. An inquiry made by the Classical association also showed that there was a small increase in the number of pupils taking Greek at the school certificate examinations. The Classical association held an unusually successful meeting at Manchester, extending over five days, at which the presidential address was delivered by Lord Soulbury on "Classics and Politics." The 23 local branches of the association continued to organize lectures in their areas, sometimes at schools for young audiences, and 11 branches held inter-school prize competitions in the reading of Latin aloud. The Society for the Promotion of Hellenic Studies followed the lead of the Classical association and the Roman society in arranging provincial meetings. These societies were all represented at the first annual meeting in Paris of the Bureau of the International Federation of Classical societies Important decisions were taken, including arrangements for the first general congress of the federation to be held in Paris in Aug.-Sept. 1950 and the allocation of the U.N.E.S.C.O. grant of $5,000 to assist the publication of further instalments of the Thesaurus Linguae Latinae (Munich), Oxyrhynchos Papyri (Part 19, London, 1948), the Bude Corpus Hermeticae (Paris), and archaeological work by Professor G. Lugli.

The Year’s Work in Classical Studies (Bristol), which had been published annually until its interruption in 1939, appeared again during 1949 as a large volume giving summaries of research work in various classical fields published during the period 1940 to June 30, 1945. The succeeding volume, to cover the period July 1, 1945 to 1948 was sent to the press and would appear early in 1950. In view of altered circumstances, it was decided that with this, the 34th issue in the series, the publication of The Year’s Work would be discontinued.

(L. J. D. R.)

CLOTHING INDUSTRY. A draft order providing for the setting up of a development council for the clothing industry was approved in the House of Commons on Nov. 1, 1949, by 196 votes to 77. This was the outstanding event of the year for an industry which had never previously had a
central body but had expressed itself through some 25 different trade associations. Organized employers were strongly opposed to the creation of a council and claimed that the support for it, as required by the order, did not exist. To this the president of the Board of Trade replied that the council was supported by the organized workers, by 1,000 of the industry's 6,000 organized firms and by prominent individual manufacturers. He pointed out that three Working parties, after examining the heavy, light and proofed clothing sections of the industry, had recommended a central body, two of them suggesting a development council. The council was to consist of 18 members, six representing the employers, one representing managers or technicians, six representing other employees, one having special knowledge of distribution and four independent members. The draft order also provided for the setting up by the council of three committees to advise on the heavy, light and proofed clothing sections and other committees to deal with special problems.

Clothes rationing came to an end in 1949. Measures to control the allocation of textiles remained, to ensure that supplies of clothing to the home market were not increased at the expense of exports. The "utility" scheme was continued and, in some sections, extended. In July, as part of the government's plan to force down the cost of living, a 5½% cut in the retail price of "utility" clothing was announced. All sections of the trade, including the manufacturers, joined in protesting against the cut but it was retained. The least part of the burden allotted to the manufacturers, in anticipation of devaluation and the consequent rise in the cost of raw materials to the clothing industry.

Efforts to expand exports of British-made clothing went forward during the year, in spite of a falling demand for some kinds. On March 2 a United Kingdom Clothing Trade mission sailed for Canada to survey the market for all types of men's, women's and children's outerwear. Among its recommendations was one that the industry should consider the possibility of group representation and/or the setting up of a central marketing organization. It was also urged that greater use should be made of air transport, especially for manufacturers, and that greater freedom should be given to manufacturers to import the latest types of machinery. Towards the end of the year these ideas were still being considered, in consultation with the Board of Trade.

In general, the export trade in clothing was adversely affected by the growth of home industries in foreign countries, notably in Canada. Import restrictions also operated against Great Britain's industry. In March South Africa imposed a complete ban on most types of imported clothing. The export target set at the end of 1949 for all clothing, including knitted wear, was a monthly average of £370 million. In the first quarter of the year the average was £270 million; in the second, £219; and in the third, £239.

Exports represented only a small part of the industry's total output. Their trend is indicated in the table.

At home the industry continued its unsuccessful efforts to get purchase tax reduced or abolished. A rebate scheme, enabling retailers to recover, in the event of a reduction, tax already paid was worked out and sent to the chancellor of the exchequer. In the labour field, the industry granted, as from May 1, a fortnight's holiday with pay. At the same time it was agreed that wages should remain stabilized until March 1, 1950.

(C. F. Dn.)

**United States.** Clothing stocks fell in retail establishments as continued high prices made large reserves unduly speculative. Based on dollar volume, sales were about the same as in 1948, while unit sales were down. All piece goods' prices fell slightly.

An important factor was the increasing importance of synthetics in men's-wear. Rayon suits were increased in usage because of their lower price. Technical difficulties in cutting, sewing and pressing were almost entirely resolved by the end of the year. Blends of nylon and wool became of increasing importance.

The woollen industry was alive to the competition of synthetics in materials; despite a universal lack of wool approaching a shortage, the Wool bureau was formed to publicize the benefits of woollen fabrics for apparel. The woollen and cotton industries seemed to be pulling together to meet a common threat.

**COAL.** During its first year of operation the National Coal board accounted showed a deficiency of £23,255,586 but during 1948 this was improved to a surplus of £1,651,965. The figures for 1949 were expected to show an increased surplus when they became available.

The forecasts made for coal production in 1949 were 202 million to 207 million tons of deep mined coal and 13 million tons of opencast coal. Actual production reached 215,113,800 tons, made up of 202,674,100 tons of deep mined and 12,439,700 tons of opencast coal. This compared with production in 1948 of 208.4 million tons, made up of 196.7 million tons deep mined and 11.7 million tons opencast. Exports averaged 14 million tons a week in 1949 compared with 10.7 million tons a week in 1948.

Early in 1949 a special committee under the chairmanship of Sir Eric Young, the production member of the board, was formed to tour the coalfields and suggest ways of raising production and lowering costs. This committee published no report but it was interesting to note that the output of deep-mined coal increased by 3% over 1948 figures in spite of a drop of 16,000 men employed in or about the mines.

Before nationalization a mine which showed repeated losses over a period was closed regardless of social obligations and the loss of capital. Under nationalization the problem acquired a new aspect. The unprofitable mines must be closed but equally the mining personnel must be preserved. To achieve this object a plan was being operated successfully in Scotland where some 8,000 to 9,000 miners with their families were being transferred from the nearly exhausted coalfields of central Lanarkshire to the richer coalfields of Ayrshire and the Forth basin. The completion of the whole scheme would take 15 to 20 years but already 1,200 miners from eight abandoned collieries in Lanarkshire were working in the more profitable areas of Fife, Stirling and the Lothians of Scotland. To encourage migration the National Coal board guaranteed a house to every married man who was transferred and paid the fares and household removal expenses for him and his dependents.

When coal mines were nationalized £1,642 million was allocated for division among 21 coal mining districts as...
compensation for loss of property. The district allocations from this total were announced during the year and steps were taken to divide these sums between the various colliery companies in each district. Considerable difficulty was likely to arise in view of the fact that the owners’ total claims were said to amount to 50% more than the sum allocated.

Prices. In July 1948 the National Coal board adjusted the price of a number of coals in an endeavour to remove some of the more glaring anomalies created by the flat-rate increases imposed during and after World War II. These adjustments did no more than reduce the price of some of the poorer qualities with compensating increases in the prices of some of the better qualities. Further adjustments of a similar nature were made during 1949 as part of a long term national price structure scheme in which the quality of the different coals would be as far as possible reflected in their relative prices. It was not intended that the price revision should increase the board’s revenue and increases in price would, as near as possible, be balanced by decreases. Generally the changes in the prices of coal for different categories of consumers were not substantial. There were, however, large variations, up and down, in the price of individual coal, increases on the one hand ranging from a few pence to 13s. a ton and decreases from a few pence to 15s. a ton.

Mechanization. During the year mechanization made further strides and the bulk of the deep-mined coal was now undercut by machines and transported part of its journey to the pit-head by conveyors.

During the year great progress was made in internal re-organization of the industry. Neighbouring pits were closed and the workmen concentrated at the more economic units without involving a mass migration of workers. New haulage roads were driven or existing ones improved so that locomotives could be substituted for rope haulages. Colliery boundaries were re-adjusted and many local re-organizations effected. In addition a number of new collieries were planned and a start was made on some of the projects. Twenty-two major schemes covering various parts of the country and involving a capital expenditure of more than £29 million were initiated. They covered projects involving concrete-lined shafts 24 ft. in diameter sunk to a depth of 1,000 yd.; complete re-organization of underground haulage by driving stone drifts over 1,000 yd. in length; the introduction of skip winding; the use of underground conveyors 1,300 yd. in length; the use of large size underground trams in conjunction with skip winding; and coal preparation plants capable of cleaning 3,000 tons of coal a day.

Substantial steps were taken towards standardization of mining equipment and stores. Before nationalization every mining company and even individual mines ordered their own supplies and this naturally led to a multitude of sizes, varieties, etc. In 1949 with central direction the purchase of supplies was organized and a degree of standardization achieved which was expected to reduce the cost of stores.

Underground Gasification. The possibility of gasifying coal in situ underground had been discussed since the beginning of the century and experiments were carried out in Russia, the U.S., Italy and Belgium which, though inconclusive, were not without some promise. In 1949 in Great Britain the test was made in a portion of a seam exposed in an open-cast working. No extravagant claims were made by the experimenters in regard to its success.

During the year the organization of the National Coal board was subjected to criticism by Sir Charles Reid, the
Coal strike remained to be assessed. This strike led to further important developments in the mining of brown coal and lignite in opencast workings and these fuels played an increasingly important part in the internal economy of the Commonwealth.

Canada. The average monthly output of coal in Canada during 1948 was 1,274,000 metric tons. In 1949 it declined to 995,000 tons in August but went up again in September to 1,088,000 tons. New hydro-electric power schemes were being developed in the eastern and western provinces but these were necessarily long term projects. In the meantime two large steam power stations were being built in Ontario to meet the rapidly growing demand for power in industrial areas.

India. The total output of coal in 1948 was 15,060,000 metric tons (including 240,000 tons from Pakistan). Production had remained at a nearly steady level after 1939 but during the period from January to May, 1949, there was a small increase; the average monthly output being 2,718,600 tons compared with 2,525,000 tons during the corresponding period in 1948.

Northern Rhodesia. Joint exploration of this territory by the government, the British South Africa company and the copper companies of Northern Rhodesia was being carried out with the view to developing any suitable coal deposits that might be found.

Southern Rhodesia. There had been a steady increase in the coal output for many years to meet the industrial and domestic needs of a growing population. In 1948 the total output was 1,704,000 metric tons or an average of 142,000 tons a month. It was still going up and in Aug. 1949 amounted to 164,800 tons. This was not enough to meet the rapidly rising demands of the two Rhodesias. Wankie colliery was expected soon to increase output materially.

Union of South Africa. Production remained practically constant during the last four or five years in the Union. The total output in 1948 was 24,024,000 metric tons and during the first seven months of 1949 it remained at practically the same level.

United States. The salient features of the coal industry in the United States are presented in Table IV.

The 1947 coal output surpassed that of all previous years, even the war peak of 1944, but the 1948 output was reduced...
nearly 5% by a strike over the unsettled work contract in the bituminous fields. The reduced output was offset by a sharp decline in exports in the second half of the year, and by a cut of 4% in consumption.

Work stoppages or restrictions were widespread in the industry in 1949, and production suffered accordingly. Up to Dec. 3, 1949, the bituminous output totalled 394,988,000 tons and the anthracite output 40,386,000 tons, a total of 435,374,000 tons—29% less than the total for the corresponding period of 1948.

COCIN-CHINA: see French Union.

COCOA. British West Africa was easily the world’s chief producer of cocoa, the crop for 1948-49 being 278,000 tons in the Gold Coast and 109,000 tons in Nigeria, as against 208,000 and 75,000 tons respectively in 1947-48; the 1949-50 crops in both territories were forecast at about midway between the two previous crops. Despite the exceptionally favourable crop in 1948-49, which was well above the prewar average, the spread of swollen shoot disease continued to threaten both the whole of the Gold Coast economy and the world’s cocoa supplies. Destruction of infected trees offers the only known means of halting the disease, but some opposition by growers resulted in a suspension of the tree-cutting campaign in 1948; intensive propaganda and an increase in compensation payments, however, reduced this opposition so that cutting could be resumed under more favourable conditions. In Nigeria the disease was not yet widespread. All cocoa in the two colonies was purchased by the Gold Coast Cocoa Marketing board and the Nigerian Marketing board. The prices paid by the two boards declined in 1949-50, falling from about £120 a ton in both territories in 1948-49 to £84 in the Gold Coast and £100 in Nigeria.

Outside the Commonwealth, Brazil’s crop for 1948-49 amounted to some 107,000 tons as against 85,000 tons in 1947-48, while in 1948-49 French West Africa and the Camerounese together provided some 90,000 tons.

The International Emergency Food committee fixed the distribution of cocoa exports for 1948-49 as follows: British West Africa, 387,800 tons; French West Africa, 78,000 tons; Brazil, 120,500 tons; and other Latin American states, 75,700 tons. Import quotas were fixed at 287,700 tons for the United States; 128,200 tons for the United Kingdom and 48,300 tons for France and French North Africa. As from June 9, 1949, however, allocation of cocoa beans by the I.E.F.C. ceased, current supply being considered adequate to meet effective demand.

British West Africa’s cocoa exports were particularly important as a dollar earner, being second only to Malay’s rubber in this respect. Exports from the Gold Coast in 1948-49 reached 243,300 tons as against 191,400 tons in 1947-48; and shipments from Nigeria in the 1948-49 season totalled 107,200 tons as compared with 83,100 tons in the preceding season. Brazil’s exports in the first six months of 1949 amounted to 39,800 tons, while those from the Dominican Republic for Jan.-Nov. 1949 were 19,100 tons. Imports into the United States, the world’s chief consumer of cocoa, in the first ten months of 1949 amounted to 229,400 tons.
as against 249,200 tons in the full year 1948. The United Kingdom took 108,000 and 147,000 tons in 1948 and 1949 respectively; the Ministry of Food was still the sole importer. Imports into other countries continued on a much smaller scale. (E. O. G.)

COFFEE. World exportable production of coffee in 1948-49 at 36 million cwt. was about 3 million cwt. above the estimate for 1947-48 but some 15% below the 1935-40 average. Latin America's output was estimated at 31,400,000 cwt. as against 28,250,000 cwt. in 1947 and a prewar average of 37,400,000 cwt. The main decline was in Brazil, which in prewar years produced on the average 26,700,000 cwt., but in 1948-49 only 19,400,000 cwt., and in Indonesia which produced only a fraction of its prewar output. Expansion of output was most marked in Colombia (6,700,000 cwt. in 1948-49 as against a prewar average of 4,800,000 cwt.) and in the African colonial territories; the latter in 1948-49 were estimated to have produced 3,900,000 cwt., about one quarter of which was provided by British East Africa.

Total exports from Latin American countries (principally Brazil) in 1948 were about 32,500,000 cwt., as against 28,800,000 cwt. in 1947; about three quarters of the quantity in both years went to the United States. Exports being at a satisfactory level, quota restrictions under the Inter-American Coffee agreement continued inoperative. Total imports of coffee into the United States in 1948 amounted to 24,750,000 cwt. in 1948 as against 22,350,000 cwt. in 1947; the prewar average annual import was about 15,500,000 cwt. Europe's imports in 1948 hardly exceeded 8,500,000 cwt., or a little above half of the prewar average, dollar difficulties substantially restricting purchases from the Latin American countries.

The Ministry of Food was again the sole buyer for the United Kingdom. Imports in 1949 amounted to 880,000 cwt. as against 1,047,000 cwt. in 1948 and 401,000 cwt. in 1938, the increase being the result of the rationing of tea and increased purchasing power. The chief sources of supply in 1948 and 1949 were British East Africa and Brazil. Kenya's and Uganda's exports to all destinations in 1948 amounted to 286,000 cwt. and 756,000 cwt. respectively; the corresponding figures for 1949 were 143,000 cwt. and 433,000 cwt. respectively. Tanganyika's coffee exports in 1948 amounted to 225,000 cwt., and in 1949 to 373,000 cwt. (E. O. G.)

COKE: see COAL.

COLD, COMMON. No fundamental information was added to knowledge of the common cold in 1949, although intensive research was in progress at the National Institute of Health and at the Western Reserve Medical School in the United States and at the National Institute for Medical Research in England. C. H. Andrews, director of studies at the last named laboratory, restated the problems involved in a series of questions: Is the common cold caused by viruses, by bacteria or neither? Is it an entity or a group of diseases? Can it be "caught" from a patient with a cold or activated in a person who harbours the causative agent or both? If it can be activated, how? What determines its seasonal incidence and why does resistance to it vary from person to person or in one person at different times? Andrews succeeded in transmitting colds to volunteers by means of filtered exudates obtained from patients with colds, but was unable to confirm the work of U.S. investigators who reported the artificial cultivation of the filtrable agent. None of a large variety of animals could be infected. From his experiments on volunteers Andrews concluded that colds are probably caused by viruses which constantly pass from one person to another, usually without causing symptoms, or only mild ones. A cold develops only in a person whose resistance is temporarily low. From such a person, virus is disseminated in large amounts, but few persons harbour it long and it probably dies out soon.

A report was made on the beneficial effects of anti-histaminic agents on the symptoms of the cold when given early in the course of the disease. It was assumed that the symptoms were caused by an allergic response of the mucous membranes to the protein of the cold virus or to other proteins. There was little doubt of the effectiveness of anti-histaminic agents for allergic rhinitis, but their value in preventing or treating the infectious cold was not positively established.

Clifford Kuh and M. F. Collen gave penicillin by mouth regularly to a large number of persons for a year and observed an equal number of untreated persons to see if penicillin had any value in the prevention of respiratory tract infections. Evidence was lacking that penicillin had any effect on the incidence of colds in the treated group. (See also EAR, NOSE AND THROAT, DISEASES OF.) (H A R N.)

COLLEGES: see UNIVERSITIES AND COLLEGES.

COLOMBIA. A republic situated in northwestern South America adjoining the Isthmus of Panama. It is the only South American country with both Caribbean and Pacific coastlines. Area: 439,714 sq. mi. Pop. (mid-1948 est.): 10,777,000. Approximately 68% of the population is classified as mixed blood, 20% as white, 7% as Indian and 5% as Negro. Most of the inhabitants live in the highlands and mountain valleys of the interior. Language: Spanish. Religion: predominantly Roman Catholic. Chief towns (pop., 1945 est.): Bogotá (807,530); Cali (575,586); Medellín (219,790); Barranquilla (206,630); Cali (135,610); Manizales (109,820); Cartagena (101,520). President, Mariano Ospina Pérez.

History. The political situation in Colombia, acute since the assassination of the liberal leader Eliécer Gaitán in April 1948, reached a new crisis in 1949 when the Liberals boycotted the presidential election and allowed the Conservative candidate to win virtually unopposed.

Frequent armed clashes between Liberal and Conservative partisans throughout the country caused about 40 deaths in the first three months of the year and induced Ospina Pérez to form a coalition cabinet in May. The Liberal ministers, however, resigned from it during the same month, charging the administration with restricting their party's activities in the congressional election campaign. The new cabinet, formed on May 22 and composed of 10 Conservatives and 3 army officers, decreed the suspension of all political gatherings, demonstrations and radio broadcasts from May 25 until three days after the congressional elections.

In the relatively quiet elections, June 5, the Liberal majority in the Chamber of Deputies was cut in half. The presidential election, originally scheduled for June 5, 1950, was advanced to Nov. 27, 1949, by a bill sponsored by the Liberals and approved reluctantly by the president in October. The major candidates were the Conservative, Laureano Gómez, former foreign minister, who returned in June from Spain where he had resided since the April 1948 riots in Bogotá, and the Liberal Dario Echandía, former minister of the interior.

Political clashes, killing hundreds and causing thousands to flee, continued throughout the country as the presidential
election neared. In October the Liberals, accusing the administration party of resorting to violence and impeaching the registration of their partisans, withdrew their candidate and prepared to boycott the election. Meanwhile Osipino Pérez, declaring a nation-wide state of siege, dissolved the Liberal-dominated congress, imposed press and radio censorship, established an evening curfew, banned all public meetings, suspended all state legislature sessions and neutralized the Liberal majority in the supreme court by decreeing a three-fourths majority necessary to nullify presidential edicts. Troops were called out to patrol Bogotá.

Under these conditions the election was held Nov. 27, and the boycott of the Liberals, though not complete, gave the Conservative candidate an adequate majority. No significant violence occurred, although the brother of the Liberal candidate was assassinated two days previously. The Liberals observed election day as one of mourning. President-elect Gómez was scheduled to take office Aug. 7, 1950.

On the economic front Colombia's commercial indebtedness ($23 million for the first three months) was gradually reduced and was completely wiped out by November. A movement in October to devalue the peso by 15 to 20% was abandoned shortly when rising coffee prices promised substantial increases in the country's dollar gold. Food expansion continued throughout the year, financed in part by an Export-Import Bank loan of $10 million and a grant of $5 million from the International Bank for Reconstruction and Development. On the darker side, petroleum exploration declined in the face of new nationalization legislation for the industry. Meanwhile the cost of living continued at a high level, the working class index rising from 256 in March to 305 in August (Feb. 1937 100). In December the government ordered the establishment of a national minimum wage of two pesos a day, from Jan.1,1950. (M. L. M.)

Education. Schools (1945) primary 12,147, pupils 788,143, teachers 21,432, secondary and vocational 1,830, pupils 94,669, teachers 7,825 (1,421 primary and 606 other schools not reporting). There were six public and two private universities. Approximately 7 4% of the 1945 national budget was allocated to public education. Illiteracy (1938). 44 2%, excluding aborigines.

Agriculture. Main crops ('000 metric tons, 1948): coffee (1947) 296, maize 700; rice 120, wheat 117, sugar cane, raw value, 80, potatoes 500; tobacco 21; cotton 5 5 Livestock ('000 head, Dec. 1947): cattle 2,065, horses 1,102, sheep 1,022.

Industry. (1945) Industrial establishments 7,853; persons employed 135,400 Fuel and power coal ('000 metric tons, 1942) 578; electricity (million kwh., 1948) 544 5; crude oil ('000 metric tons, 1948; 1949, six months) 3,376 (2,06); raw materials (1945): lead 335,260 fine oz., silver 108,716 oz., platinum 40,047 oz., salt 124,081 metric tons Manufactured goods (1948, six months) rayon yarn 3 5 million lb.; cotton cloth 85 million yd.; woollen cloth 935,000 yd.; cement 175,000 metric tons.

Telephones (Jan. 1948) subscribers 57,300.

COMMUNIST MOVEMENT. The history of communism in 1949 was characterized by the growing emphasis on Russia's undisputable precedence in world communism and on Joseph Stalin's (q.v.) "infallibility" in the political, economic, scientific and artistic fields. Stalin's 70th birthday on Dec. 21 was celebrated with unprecedented solemnity throughout the Soviet Union, Communist China and the Soviet satellite countries of eastern Europe. On the occasion of this celebration Stalin could look with satisfaction on the immense expansion of his power after World War II. It was true that during 1949 the expansion of communism had been checked in Europe. Not only had there been a re-invigoration of democracy in all non-Soviet controlled European countries, but Communist Yugoslavia had successfully challenged the unlimited Soviet control over all Communist lands. But this relative setback in Europe had been more than outweighed by the great advance of Communist control in eastern Asia, where Communists occupied almost the whole extent of the Chinese republic and found themselves at the gates of Vietnam (Indo-China) and of Burma. Thus communism, at the end of 1949, continued to spread to a large area inhabited by about 700 million people and containing, in addition to the resources of the greatly expanded Soviet Union, those of Poland, Czechoslovakia, Eastern Germany, Rumania, Hungary and Bulgaria.

During 1949 Communist policy deepened its anti-western stand, especially in all fields of culture, science and the arts. The Communist central organ, Pravda, carried on Jan. 28 a violent article against six "anti-patriotic" theatre critics which was followed by a similar article in the weekly Culture and Life on Jan. 30. "Once and for all," Pravda declared, "we must decidedly put an end to the liberal tolerance of all these aesthetic nomenlites who lack the healthy feeling of love of country and the people." The year 1949 was largely devoted to a programme of doing away with "this aesthetic drivel decisively, once and for ever." Similar constructive energy as to the fight against "decadent bourgeois art" was devoted in the Soviet Union and in its satellites to depict in films, plays and novels the moral decadence and the economic oppression prevailing in the United States and to denounce the warlike intentions of the U.S. and Great Britain. Vocal support for the "peace loving" Soviet policy against the "war mongering" of the western democracies was organized among non-Russian intellectuals through the various Communist-sponsored "peace" congresses. The most violent attacks, however, were reserved in the domestic field for what was called "homeless cosmopolitanism" and "belittling" of the leadership of Russia in all fields of culture. Russian priority was claimed for many scientific inventions.

This policy within the Soviet Union went hand in hand with an attempt to tighten Communist control over the satellite states. The main instrument of this policy was the Communist Information bureau, or the Cominform. It was established on Sept. 22-23, 1947, in the former hunting lodge of Hermann Goring, at Wilczew Gora (Wolves' Hill), on the northern slopes of the Giant mountains, Poland. The second plenary meeting of the Cominform took place in June 1948 at Sinaia, Rumania, and it was there that an attack against the Yugoslav Communist government was launched. In Nov. 1949 the Cominform met at a luxury hotel in the Matra mountain area, in Hungary, and adopted a number of resolutions directed against "Anglo-American imperialism," the "enslaving Marshall plan," the "reactionary trade union leaders, the accomplices of the warmongers, who conceal their betrayal in pseudo-Socialist cosmopolitan phraseology," and the "traitorous Tito-Rankovic clique," the Yugoslav
COMMUNIST MOVEMENT

Communist government which was accused of conducting a provocative campaign against the U.S.S.R., "using the foulest provocations, borrowed from the arsenal of Hitler." There could be no doubt that the long and successful resistance of Marshal Tito and his fully Communist government to the "cold war" waged against them by the Soviet Union and the Cominform did much to weaken the influence of Moscow among Communists and fellow travellers.

The actions of the Cominform and the unquestioning loyalty which Moscow demanded from Communists everywhere made it clear that the Communist International, though officially disbanded in 1943, was stronger than ever.

In that sense Gheorghi Dimitrov (see OBITUARIES), the Bulgarian Communist leader, wrote on Dec. 18, 1948: "It should not be forgotten that—in spite of the fact that the Communist International does not exist—all Communist parties in the world form one single Communist front, under the direction of the most powerful and most experienced Communist party, the party of Lenin and Stalin; that all Communist parties have one common scientific theory as a guide to their actions—Marxist-Leninism; and that all Communist parties have one leader and teacher, recognized by all—Comrade Stalin." In that connection the leaders of the French and Italian Communist parties, Maurice Thorez and Palmiro Togliatti (q.v.), declared on Feb. 22 and 26 respectively that the case of the Soviet Union and the workers of France and Italy would show the same attitude towards the Soviet army as did the people of Poland, Rumania and Yugoslavia. Harry Pollitt, secretary general of the British Communist party, stated on Feb. 28 that in the event of an aggressive war against the U.S.S.R., the party would organize strikes to prevent that war from being carried through. William Z. Foster and Eugene Dennis, respectively national chairman and secretary general of the U.S. Communist party, on March 2 backed these declarations of loyalty to the Soviet Union.

The Moscow leadership took strong measures in all European satellite countries to assure an unswerving loyalty to its commands on the part of the local Communists. Purges were conducted in all the Communist parties, and even some of the most prominent Communist leaders became their victims. Among them were László Rajk in Hungary, Traicho Kostov in Bulgaria, and Koçi Xoxe in Albania, who were executed (see OBITUARIES), while the Greek Communist leader, Markos Vafiades, and the Polish Communist leader, Władysław Gomułka (see POLAND), were disgraced. No such measures were necessary in China, where the Communist party, under the leadership of Mao Tse-tung, Chou En-lai (qq.v.) and Liu Shao-chi, followed faithfully the Moscow line and repeated wholeheartedly the sharp Communist attacks against the United States and the democratic countries. The establishment of the Communist People's Republic of China on Oct. 1 was hailed by the Soviet historian, Evgeny Tarlé, in Izvestia as one of the two "stupendous events" of the year, the other being the end of the U.S. monopoly of atomic bombs.

The Communist victories in Asia had no counterpart in Europe. There, even in countries bordering on the Soviet Union or partly under Soviet influence, such as Norway, Finland and Austria, communism was fast losing whatever hold it had on the working masses. The Communist-led strikes in Finland, which started in August, ended within four weeks with a complete victory of the anti-Communist government; in the elections to the Norwegian parliament (Oct. 10) no Communist candidate was elected; and at the elections in Belgium (June 26) the Communist vote was 7.5% instead of 12.7% as in 1946 (see ELECTIONS). In Italy, Togliatti himself announced on March 25, 1949, that the party's membership was 1,896,634 as compared with 2,283,000 in Sept. 1948. At its annual conference at Bridlington, Yorkshire, the British Trade Union congress on Sept. 6 endorsed by 6,746,000 to 760,000 votes a report, moved by Vincent Tewson for the general council, drawing attention to the necessity of combating Communist interference in the trade unions. Similarly the Communists lost much of the influence which they had gained in the last 20 years in the U.S. labour movement. The Congress of Industrial Organizations withdrew from the Communist-controlled World Federation of Trade Unions and was responsible, together with the American Federation of Labour, for the creation of an anti-Communist International Confederation of Free Trade Unions (see TRADE UNIONS). The C.I.O. convention in Cleveland, Ohio, at the beginning of November expelled two affiliates, the United Electrical, Radio and Machine Workers of America and the United Farm Equipment and Metal Workers of America, accusing them of being creatures of the Communist party, masquerading as trade unions. Similarly, Great Britain's largest trade union, the Transport and General Workers' union, voted to bar Communists and members of the British Fascist union from holding office in the union.

* Only European countries having a parliamentary system and free elections are included.

This represents the number of votes obtained by the Democratic Popular Front (q.v.), the Communist and the left-wing Socialist party led by Pietro Nenni. But out of 183 deputies elected under the front's banner 132 were Communists.

The 12 top leaders of the Communist party of the United States who were indicted by a special federal grand jury on July 20, 1948, were tried (with the exception of W. Z. Foster who was ill) before Federal Judge Harold R. Medina from Jan. 17 to Oct. 14, 1949, when they were found guilty by the jury of secretly teaching and advocating on secret orders from Moscow, the overthrow of the U.S. government and the destruction of American democracy by violent means. Ten of them were sentenced to five years and one to three years' imprisonment and all were fined $10,000 each, but an appeal was made against the verdict. The small vote which the American Labour party cast at the mayoralty elections in New York City in Nov. 1949, the dissolution of the American Youth for Democracy, a Communist-front organization on college campuses, and the decline of the influence of the American Slav congress, a Communist-front organization among the U.S. citizens of Slav descent, all pointed in the same direction. A similar weakening of Communist influence, especially in the labour movements, became visible in Canada, Australia and New Zealand.
CONGRESSIONAL CHURCHES—CONGRESS

CONGRESS, U.S. The first session of the 81st congress, meeting in regular session from Jan. 3 to Oct. 19, 1949, added a total of 793 laws to the statute books, of which 440 were public and 353 private. During the session, the longest in peacetime since 1922, 3,160 measures were introduced in the Senate and 7,467 in the House of Representatives. President Harry S. Truman vetoed 32 bills; not one of his vetoes was overridden.

The Democratic party had a safe numerical majority in both the Senate and the House, but the effectiveness of its control was lessened on many domestic issues by the coalition of southern Democratic members with the Republican minority. At the start of the session there were 54 Democrats and 42 Republicans in the Senate and 263 Democrats, 171 Republicans and 1 American Labour party in the House of Representatives. Representative Sam Rayburn (Texas) was elected speaker of the House, the post which he held in the 76th-79th congresses, and Senator Kenneth D. McKellar (Tennessee) was elected president pro tempore of the Senate pending the inauguration of Alben W. Barkley (q.v.) as vice president on Jan. 20, 1949.

On June 28, Senator Robert F. Wagner (Democrat, New York) resigned because of ill-health. Under a state law of 1947, the governor of New York, Thomas E. Dewey, appointed John Foster Dulles (Republican) to fill the vacancy until Jan. 1950. In an election on Nov. 7 Herbert Lehmann (Democrat) received 2,573,934 votes and Dulles 2,377,641. Also on Nov. 7, elections were held for seats in the House of Representatives for New York (Brooklyn) and California (5th district). Mrs. Edna Kelly (Democrat) was elected for Brooklyn and John F. Shelley (Democrat) won the California seat from the Republicans.

In November William Benton was appointed by the governor of Connecticut, Chester Bowles, to fill the vacancy in the Senate caused by the appointment of Raymond E. Baldwin (Republican) to the Connecticut supreme court.

In his annual state of the union message to congress on Jan. 5, President Truman called for extensive social legislation and measures to combat inflation along the lines of the programme on which he had stood during the 1948 presidential election. The keynote of his programme was that "every individual has a right to expect from his government a fair deal," and it was immediately characterized in the press and elsewhere as the Fair Deal.

The administration's domestic programme made slow headway, and most of its "must" measures were still to be acted upon by one or both houses of congress at the end of the session. Prominent among them were the compulsory health insurance programme, universal military training, the federal civil rights programme, liberalization of the Displaced Persons act of 1948, expansion and liberalization of the federal social security programme and imposition of $4,000 million of additional personal and corporate taxes. The administration programme, perhaps its most outstanding defeat in the session, was the passage by both houses of congress of proposals for outright repeal of the Taft-Hartley labour act and re-enactment of the Wagner act of 1935 with a few amendments.

On the positive side, from the point of view of the administration, congress approved the Fair Labour Standards act amendments of 1949, the Housing and Rent act of 1949, which extended federal rent controls to June 30, 1950, but made provision for local decontrol, the Housing act of 1949, which authorized a long-range public housing, slum clearance and rural housing aid programme and the National Security act amendments of 1949, which placed the defence establishment under the executive control of the secretary of defence.

With the exception of the Point Four programme for the development of backward areas, the administration's foreign programme was enacted with the support of both Democrats.
and Republicans. The Senate rejected all efforts to qualify the North Atlantic treaty and consented to its ratification on July 21 by a vote of 82 to 13. The Mutual Defence Assistance act, which authorized the appropriation of $1,314 million for arms for friendly foreign nations, was passed by both houses on Sept. 28. On April 14, both houses approved a bill authorizing the appropriation of $5,430 million for the period April 1, 1949-June 30, 1950, and on Sept. 29 they approved a bill appropriating $5,659,990,000 for foreign economic aid, of which $4,702,380,000 was for the European Recovery programme. (J. W. M.)

**CONGRESS OF INDUSTRIAL ORGANIZATIONS:** see TRADE UNIONS.

**CONNALLY, TOM (THOMAS TERRY),** U.S. senator (b. McLennan county, Texas, Aug. 19, 1877); graduated from Baylor university, Waco, Texas, and from the University of Texas, Austin, Texas. He was elected to the Texas House of Representatives in 1900 and again in 1902. In 1916 he was elected to the U.S. House of Representatives, where he served for six successive terms. He was elected to the U.S. Senate in 1928 and was re-elected in 1934, 1940 and 1946. At the close of World War II, during most of which he served as chairman of the Senate foreign relations committee, he attended the United Nations Conference on International organization at San Francisco, as vice chairman of the U.S. delegation and was also a delegate to the first U.N. general assembly in London and New York in 1946. He attended the Council of Foreign Ministers sessions in Paris and New York in 1946 and the peace conference in Paris the same year. When the Republican party gained control of the 80th congress, Connally, a Democrat, relinquished the chairmanship of the Senate foreign relations committee, but during that time worked with Republican Senator Arthur H. Vandenberg on a bipartisan approach to foreign policies. In 1949 he resumed the chairmanship and steered the North Atlantic treaty through the Senate in addition to the European aid bill and the Military Assistance programme supplement the Atlantic treaty.

**CONSERVATIVE PARTY:** see POLITICAL PARTIES, BRITISH.

**CONSUMER CREDIT.** During 1949 traders in all parts of Great Britain reported a substantial increase in the demands that were being made upon them for credit facilities for the purchase of consumer goods. The tendency for the situation to change in this way had become apparent in 1948, but during 1949 it became much more marked. Not only had the surplus of ready money in the hands of the purchasing public, which had accumulated by reason of savings during the war years and by the payment of service gratuities, become exhausted, but there was a very much larger variety of goods on the market competing for such cash as was still available. The cost of living still remained high, and with these various influences at work an increase in the amount of consumer credit that had come to be granted was hardly surprising.

Although the increase was not confined to any one particular type or method of consumer credit granting, it was probably most marked in the hire purchase field. Such items as furniture, domestic appliances, radios, refrigerators, cycles and motor cycles were largely sold on this system, and traders handling these lines in some districts reported that, unless they could extend credit to their customers, they would be unable to keep their stocks turned over.

In August, and again in September, restrictions were relaxed on a considerable number of articles which, until then, had prevented the making of a service charge for hire purchase or credit sale transactions. For example, until these restrictions were lifted, it was not possible to sell a camera on hire purchase terms and to add a service charge to cover the additional cost of the credit to the retailer. The easing of this control enabling a further range of goods to be sold on hire purchase terms also contributed to the increase in the amount of consumer credit that was granted during the year.

The increase, large as it was, would probably have been even greater had it not been for the continuation of the policy laid down by the Treasury some years previously restricting the amount of finance which could be made available for hire purchase transactions on consumer goods. Before World War II a high percentage of such transactions had been financed not by the retailer himself but by the banks or by the specialized finance houses. The effect of the Treasury restriction made it impossible for these sources to accept all the increased business offered to them, and some retailers reported that they were unable to grant any further hire purchase credit owing to the fact that they themselves were unable to obtain the additional financial backing they required.

An increase was also noticed in the length of credit being granted. On open credit accounts, longer time was required before the account was to be become due for payment, and in the case of customers who were discussing hire purchase agreements were found, in a high percentage of cases, to ask for the agreement to be drawn so as to cover a longer period than would have been the case a year or so previously.

During the year, collections on amounts outstanding appeared on the whole to be satisfactory, although in one or two quarters a tendency to slowness was reported. The full employment of the community, which had continued throughout the year, was obviously an important factor in bringing this about and, where proper care had been exercised in checking the credit standing of the customer prior to the opening of the account, overdues were not high. (C. C. Ws.)

**United States.** Consumer credit, as reflected by consumer debt statistics published by the board of governors of the federal reserve system, reached an unprecedented high level in the United States during 1949, when more than $17,000 million receivables were reported held by retail and service establishments and by consumer cash loan agencies. Not only was the amount of such debt unequalled, but the rate of its growth was also notable, for during the past decade this type of consumer debt had doubled, and since 1943, a wartime year when it was abnormally low, had increased threefold.

The increase of total consumer debt since World War II was attributable almost entirely to the increase of instalment debt, particularly that arising from the sale of automobiles.

Notwithstanding the marked growth of consumer debt in absolute amount, its increase was relatively less than the over-all growth of the entire economy since 1939. Consumer debt increased, but so also did the means of paying debt and the general setting in which the debt arose. It was true that whereas consumer debt in 1939 was $7,000 million, in 1949 it was $17,000 million. Nevertheless, while such debt increased to 2-42 times what it had been a decade before, personal disposable income remaining after payment of taxes was, in 1949, 2-75 times what it had been in 1939. Similarly, personal savings made during 1949 were more than six times as much as in 1939.

The quantity of consumer debt outstanding was no more significant than its qualitative aspects, and in 1949, besides attaining unprecedented volume, consumer credit also showed certain characteristics attributable to circumstances peculiar to that year. During 1949 consumer credit terms were made easier and collections were retarded as a result of increased competition among sellers for consumer purchases.
and the expiration of legal restraints imposed by the Federal government upon instalment sales. On the one hand, terms were affected by increased competition which reflected the growing availability of consumer durable goods following World War II and the curtailed demand resulting from reductions in employment and in factory pay rolls. Pressures upon sellers also arose from threats of economic instability hinted at by a declining rate of physical production and by a drop in many wholesale and retail prices. In order to open broader markets and to appeal more effectively to marginal income groups, easy credit terms were offered widely. On the other hand, the expiration of regulation W, providing through federal authority for minimum down payments and maximum credit periods, accentuated the trend towards competition in credit terms. Reinstated on Sept. 20, 1948, following a brief lapse, regulation W was partially relaxed on March 7, 1949, when the maximum maturity on all consumer instalment contracts was made uniformly 21 months, instead of 15 to 18 months, and the required down payment was reduced from 20% to 15%, except in the case of automobiles, where the down payment remained at 33 1/3%. The regulation was further relaxed on April 27, 1949, when down payments for articles other than automobiles were further reduced to 10% and all maximum maturities were increased to 24 months. At the same time, all sales amounting to less than $100 were thereafter exempted from regulation. Finally, on June 30, the authority of the federal reserve board to regulate consumer credit expired.

The predictable effect of the passing of legal restraints upon consumer credit, especially in the face of tightening sales conditions, was a noticeable breaking away from prevailing terms. This was the case mainly in instalment credit, for charge account regulation expired in 1948 with little evident effect upon that form of credit. In the instalment field, however, the termination of regulation was accompanied by general elimination of down payments on radios, television sets, refrigerators, furniture and the like, and by the common extension of the payment period up to 24 months. Terms on automobile credit were made easier than for most other commodities. In the case of soft goods, too, credit terms were made easier by the elimination of the down payment and the extension of time to from 6 to 12 months.

Another development in consumer credit was the slowing down of the rate of collections, particularly characteristic where sales were in large measure made on instalment credit. Within a 12-month period, for example, monthly ratios of collections to beginning-of-month outstandings dropped 22% in furniture stores, 24% in household appliance stores and 19% in jewellery stores. Department stores, on the other hand, fared better, for there appeared to be no appreciable change in the collection of either their instalment or charge accounts during the same period of 1949.

**Contract Bridge.** For the second year in succession the winners and runners-up in the European championship of 1949 were respectively Great Britain and Sweden; Denmark finished third. The contest was played in Paris from July 4-10, 11 countries taking part. The British team was M. Harrison-Gray, K. Konstam, L. Dodds, E. Rayne, B. Shapiro, T. Reese and A. Meredith. The women's event was won by Denmark (winners in 1948 also) with France second and Italy third. Great Britain, whose team was Mrs. A. L. Fleming, Mrs. F. Gordon, Lady Rhodes, Mrs. L. Litanter, Mrs. P. Williams and Mrs. M. Lester, finished fourth.

The champion team of America, S. Stayman, G. Rapee, J. Crawford and F. Levanttritt, played a match in London during May for the Crownshied cup, presented by an American for a contest between the leading English and American players. The English players, who won by a narrow margin, were M. Harrison-Gray, K. Konstam, B. Shapiro, T. Reese, Ewart Kempson, L. Dodds, E. Rayne, J. Pavlides, G. Mathieson and Mrs. R. Markus. The first four, who represented Crookfield's club, gained a lead of 2,950 in the first half of the match. The American team also lost to the Lyndhurst club, whose team was, L. Tarlo, H. Franklin, Dr. H. Leist, A. Meredith, Dr. M. Rockfelt and A. Rose.

For the first time in the history of the Gold cup, Britain's premier team contest, a Scottish side reached the final. The cup was, however, won by Graham Mathieson's London team. The annual North-South contest was won by the South who now led 7-6 in the series. The international contest between England, Scotland, Wales, Northern Ireland and the Bridge association of Ireland, was won by England.

The most successful tournament player during the year was Graham Mathieson of London who won six major events. A regular bridge feature was carried by each of the following London newspapers: The Times, Daily Telegraph, Star, Evening News and Evening Standard. The Bridge Magazine and the Contract Bridge Journal, two magazines entirely devoted to bridge, were published every month. Bridge was also a comparatively regular feature in the B.B.C. light programme.

**United States.** In January new laws for duplicate bridge were released. For the first time, these laws were an international code, adopted by the European Bridge league's members as well as in the western hemisphere.

In bidding, the principal development was the adoption of point-count valuation by Charles Goren of Philadelphia, Pennsylvania, one of the principal authorities. Under this method, based on calculations originally made by W. M. Anderson of Toronto, Canada, each ace is counted as 4 points, king 3, queen 2, knave 1; 1 point is added for each doubleton in the hand, 2 for each singleton, 3 for each void. A hand of 14 points or slightly less is considered biddable, and a combined partnership count of 26 or more justifies bidding game.

In November the New York metropolitan women's pair championship was won by a Negro pair, Doris Brooks and Geraldine Gibson, and Mrs. Brooks also won the mixed-pair contest, paired with a white partner, M. C. Keller. G. Rapee, New York, won the individual Master's championship for 1949.

(E. Cul.; A. H. Md.)

**CO-OPEATIVE MOVEMENT.** In 1948 retail sales amounted to £490 million, as compared with £434 million in 1947. Trading surplus, at £45,921,000, was a little lower than in 1947, despite increased sales, because of price-cutting at the government's request, a policy which could not be sustained when it threatened seriously to affect dividends on purchases without leading to any large increases in membership. Dividends on purchases, at £35,461,000, were nearly the same as in 1947, but at a reduced rate on the £1 of sales. Share capital fell from £247 million to £243 million. Wages and salaries advanced from £57,453,000 to £63,549,000. The co-operative wholesale societies of all types increased sales from £293 million to £331 million, but trading surpluses fell from £14 million to £12 million. The total production value of all co-operative productive agencies was £181,586,000, or against £157,569,000 in 1947. Of the 1948 total, £103 million was accounted for by the two major wholesale societies, English and Scottish, £60 million by retail societies and £18 million by others, including the producers' societies (about £5,500,000). The principal development in British co-operation during 1949 was the inauguration of "national membership," to which most of 1,000 retail societies were parties. This system...
COSTA RICA

was designed to enable any member of a participating society to receive dividend on purchases made at any such society's shops. It is still too soon to judge the effects of national membership: the chief complaint against it was the heavy book-keeping involved, as each society had its own rate of dividend on purchases. There were proposals to simplify the scheme by making dividends on purchases payable at a uniform rate.

In 1949 the figures of co-operative registrations under food rationing showed few changes as compared with 1948. The co-operative societies held over 13 million registrations for sugar and for milk, and nearly the same number for butter and fats and also for cheese. For bacon they held 11,732,000; for eggs 10,029,000; and for other meat 7,236,000. For coal, registration was on a household basis and the co-operative total of 2,653,833 was well over one-fifth of the total. In other branches of trade, co-operative trade accounted for about the following proportions of national trade: dairy products 32%; bread and grocery 16%; meat 12%; boots and shoes 10%; tobacco 8%; clothing, furnishings and hardware 6-7%; pharmacy 6%. In other commodities the co-operative share in retail trade was relatively small. These figures indicated that the co-operative societies were barely holding their own in competition with other trading agencies. Expansion was made possible because of restrictions on building and difficulties in getting permits from local authorities to open new shops. There was some buying up of private businesses and development of self-service stores and travelling shops.

During 1949 there was much discussion between the Labour party and the co-operatives in an endeavour to arrive at a clearer line of demarcation between spheres of public ownership and co-operative enterprise. The question was brought to a head by the Labour party's proposal in its draft election programme for 1950 to nationalize industrial insurance. This would have involved taking over the co-operative insurance society; and strong protests by the co-operative leaders led to a change in the government's plans. The Labour party now proposed to leave in being all insurance societies run on a "mutual" basis and to convert the profit-making insurance companies into mutual societies.

The Co-operative-Labour discussions also ranged over a wider field, including the marketing of agricultural produce and of coal and the entire future organization of retail distribution. They were still unfinished in December; but it had become clear that co-operators were insisting on having more account taken of co-operative aspirations in the framing of Labour policy.

No conference of the International Co-operative alliance, which still included countries of eastern Europe as well as of the west, was held during 1949. In the international field the main events were a considerable expansion of the revived co-operative movement in Western Germany, a further growth of co-operatives in the British colonies, especially in West Africa, and an increase in educational work, especially in training co-operative leaders for work in the less advanced areas. East of the "iron curtain," there was a further rapid growth of state-controlled agricultural co-operatives in the satellite states and also in Yugoslavia. In Palestine the Israeli government continued to promote co-operative enterprise. The International Co-operative alliance, with headquarters in London, increased its activities after the Prague conference of 1948 and avoided a doctrinal split. It collaborated actively with economic agencies attached to the United Nations and with the International Labour organization. (G. D. H. C.)

United States. In 1949 there were about 10 million members of various types of U.S. co-operatives including agricultural marketing associations, credit co-operatives or credit unions, consumer co-operatives, insurance, housing, health and medical care, publication and broadcasting and other enterprises.

The outstanding development of co-operatives in 1949 was an increase in co-operative housing and a drive for legislation in middle income housing. At the close of 1949 more than 100 co-operative housing projects were in operation serving over 30,000 families. These projects included all types of homes from city apartment houses in New York to small 10-family projects of individual homes in rural and suburban areas.

In the field of medical co-operatives, the Co-operative Health Federation of America and the American Medical association reached a working agreement on the role of co-operative and pre-payment medical care in the U.S. economy and a number of new co-operative health associations were established. Membership continued to increase in prepaid medical care plans and co-operative hospitals.

In retail food distribution about 1,000 co-operative food stores handled a volume of business estimated at about $100 million retail, with branches from Massachusetts to California.

Farm supply co-operatives continued to be the largest single volume business in the consumer co-operative field, with sales of nearly $1,000 million in seed, feed, fertilizer, farm machinery and other farm supplies.

Marketing co-operatives represented more than half of the U.S. families with a volume of business of over $3,000 million. There were 13 major fields of marketing, including dairy products, grain, citrus fruits, wool, poultry products and so forth.

Internationally the co-operatives continued to make headway. The largest Co-operative for American Remittances to Europe, better known as C.A.R.E., had distributed nearly $100 million worth of relief packages (food and textiles) abroad since it was established late in 1945. Another, the International Co-operative Petroleum association, was completing its second year of operation and was shipping petroleum products from the co-operatives in America to co-operatives in South Africa, Australia, New Zealand, France, Scotland, Yugoslavia and other countries. (W. J. Cl.)

CORN: see GRAIN CROPS.

COSMETICS: see SOAP, PERFUMERY AND COSMETICS.

COSTA RICA. A Central American republic, located between Nicaragua and Panama. Area: 19,238 sq. mi. Pop. (mid-1949 est.) 837,000, classified as about 80% white, 16% mixed, 3% Negro, less than 1% Indian. Chief towns (pop., 1948 est.): San José (cap., 90,615); Heredia (12,038); Alajuela (11,663); Cartago (11,505). Language: Spanish. Religion: predominantly Roman Catholic. Presidents in 1949, Colonel José Figueres Ferrer (provisional) and Otilio Ulate Blanco.

History. The year brought a restoration of constitutional government after a previous year of revolt and dictatorship. The Constituent Assembly met on Jan. 16, restored political liberties, drew up a new constitution and retired, Nov. 8, in favour of a Legislative Assembly. On the same date Colonel José Figueres and his revolutionary junta resigned and president-elect Otilio Ulate Blanco was inaugurated.

The return to democratic government was interrupted on April 2 by a military revolt fomented by the minister of national defence, Colonel Edgardo Cardona, but the uprising was crushed within 24 hours. Six were killed and 24 were injured in the fighting. Those arrested in connection with the revolt were granted complete amnesty in June by Figueres.

Notwithstanding the attempted coup, the junta agreed in April to resign on May 8 and turn the government over to Ulate, but the president-elect refused to take office until the new constitution was promulgated and a Legislative Assembly
COTTON

187
elected. In the congressional elections, Oct. 2, Ulate’s party, the National Union, won a majority of the seats (33 out of 45) and also elected both of the vice-presidents. The remaining seats in the assembly were distributed among five other parties. On his inauguration, Nov. 8, Ulate pledged particular support to new social security legislation, public health, education and a higher standard of living for the people.

The critical relations between Costa Rica and Nicaragua according to the so-called ‘Voyage of exiled former President Rafael Calderón Guardia’s sympathizers in Dec. 1948, were smoothed in January through the offices of the Organization of American States (q.v.). The dispute was settled completely in February by a friendship pact signed by the two countries in Washington.

On the economic front, rising coffee prices in the world market were offset during 1949 by previous commitments to sell the current crop at lower prices. The general cost of living index figure rose from 241 in March (1936 = 100) to 250 in August. In July, however, a series of government decrees established new minimum wage rates affecting almost every employee in the country and calling for wage increases from 15% for peasants in the central plateau to as much as 250% for some white-collar workers.

Agriculture. The 1949-50 coffee crop was forecast to reach a record 475,000 bags of 132 lb. each. Other major crops (1948, in ’000 lb.): corn 46,847; rice 28,209; potatoes 27,646; beans 22,338. In 1949 there were 492,048 head of cattle in the country.

Foreign Trade. Exports in 1948 were valued at U.S.$ 131,839,900; imports amounted to $42,344,379. The U.S. took 72% of the exports and supplied 78% of the imports. The main imports were wheat flour, sulphate of soda and cotton textiles. The chief exports were coffee, bananas, citrus fruits and aloe fibre.

Communications. At the end of 1947 there were 414 mi of public and 255 mi of private railways and 1,015 mi of improved highways. At the end of 1946 there were 2,800 automobiles, 600 buses and 1,300 commercial vehicles registered.

Finance. (’000 colones) Budget (1949 est.) ordinary expenditure 110,762, extraordinary expenditure 106,968. (1948, actual) expenditure 114,797; revenue 90,080. Public debt (end 1948): external 169,136; internal 147,561. At the end of June 1949, the Central bank had gold reserves totalling 11,547 and currency circulation amounted to 103,410. The monetary unit is the colón, valued officially at 17.6 U.S. cents on July 31, 1949, but with street-market quotations as low as 11-11 cents on Oct. 22.

(C. L. M.)

COTTON, Progress continued to be made in the cotton industry in Great Britain throughout 1949, although the recovery towards prewar performances was not swift. Yarn production in the closing months of the year was the highest after World War II and the number of workers employed in spinning and weaving exceeded 300,000, compared with 360,000 in 1937. Further recruitment gains took place, stimulated by better amenities in the mills, the use of part-time labour and foreign trainees from Europe. In the first half of the year, both spinning and weaving operatives obtained wage increases, and the new list for mule spinners based on the recommendations of the Evershed report was adopted. The final report of the Cotton Manufacturing commission urged the importance of introducing its earlier proposals for a new alternative wage system. Agreement on this voluntary plan was reached at the end of the year.

The Raw Cotton commission continued its policy of revising selling rates to British spinners in accordance with changes in world values. The price of American cotton remained relatively stable, rising from 23-00d. per lb. at the beginning of the year to 23-50d. before devaluation. The currency changes resulted in a sharp advance to 28-15d. per lb., the price at the end of December being 29-65d. Long staple Egyptian Karnak cotton fell in price from 52-00d. per lb. in January to 40-00d. in mid-April. In November the selling quotation had recovered to 44-50d. per lb. Egyptian Ashmouni cotton, valued at 30-15d. per lb. at the beginning of the year, declined to 25-65d. in June but was raised after devaluation until the price in December was 38-85d. A new cover scheme was generally adopted from the beginning of December, enabling mill-owners to buy raw cotton on forward delivery terms with adequate cover facilities.

Statutory price control was lifted from yarn and cloth in April but the existing level of values was fully maintained by the trade itself. Further freedom was given to exporters by the abolition of the market grouping and symbol systems, enabling shippers to send yarn and cloth to destinations of their own choice. The national economic need to increase exports to hard currency markets was continually stressed. Exports of cotton piece goods for the first 11 months of the year totalled 838,379,000 sq. yd., a substantial advance on shipments for the whole of 1948. Main customers were British West Africa, Australia, South Africa, Pakistan and India. The import ban imposed by South Africa and India hampered trading in the second half of the year. Yarn exports for the first 11 months of the year amounted to 76,530,400 lb., much larger than the aggregate for 1948. Leading consumers were Pakistan, India, the Netherlands, Australia and Hong Kong. After devaluation, a rush of business from soft currency markets, chiefly in Europe, caused the Board of Trade to issue a warning that further applications for export licences to such areas would be very closely watched.

Grouping of mills under the government’s modernization programme made better progress, 28 spinning amalgamations being approved by the Board of Trade, representing 59% of the total spindles installed. Re-equipment proposals were submitted for 60 mills, the time for booking new machinery under the act being extended to April, 1950.

Clothes rationing ended in Great Britain in March but little difficulty was experienced in meeting the demand of the home trade. Extensive revisions in maximum utility cloth prices were enforced. Owners of textile bleaching and printing plant agreed to enter into arrangements to reduce surplus machinery. It was proposed that re-organization boards should be set up to accept redundant plant offered voluntarily, and that financial support should be given by those firms which remained in the trade.

Cotton textile producing countries in Europe generally made steady progress and several nations were able to export goods in larger quantities than before World War II. British spinners and manufacturers found little evidence of a return to a buyer’s market. Supplies were again supplemented by imports of grey cloth, chiefly from Japan, for finishing and re-export. Demand generally continued to exceed supply but the industry remained, both financially and organically, much stronger than at any time after 1920.

United States. Manufacture. The decline in the U.S. cotton industry continued throughout the first half of 1949, but there was an appreciable improvement after June. By the end of the year there was an active demand and a rising trend of production and prices.

However, the production for the year was expected to show a minimum drop of 13% compared with 1948. On a yardage basis, 1949 production was down at least 1,200 million yd. Production during the first nine months of the year was 6,197 million yd., compared with 7,577 million yd. in the corresponding period of 1948. Spindle activity in September was 115% of 80-hr. capacity as compared with 103% for the first six months of the year. Some prices had advanced as much as 25% above the low July level—the average increase was nearer 10 than 15%.

Production. The U.S. cotton crop of 1949 of 16,034,000 bales (of 500 lb. gross weight) was the sixth largest on record,
COUNCIL OF EUROPE

comparable with 14,877,000 bales in 1948, and an average for 1938-47 of only 11,306,000 bales. It was valued at approximately $2,300 million. The estimated lint yield per harvested acre in 1949 was 285-8 lb., compared with 312-6 lb. in 1948 but the third highest on record and comparable to the 254 lb. average during 1938-47. Acreage harvested in 1949 was 26,898,000, or 18% more than the 22,821,000 ac. harvested in 1948 and even larger in comparison with the 21,396,000 ac. average of the previous decade. This large acreage was in spite of a government request that an acreage goal of 21,894,000 ac. be observed. Texas, California, Arizona and New Mexico produced 50% of the 1949 crop. The 1949 crop of American-Egyptian cotton was 4,300 bales, whereas only 3,600 bales were produced in 1948; the average for 1938-47 was 29,500 bales.

Cotton prices for growers reached a peak of 30-13 cents per lb. in June, before the condition and probable size of the 1949 crop were adequately indicated, but declined to 27-76 cents per lb. in November. The probable average price for the 1949 crop was indicated at 28-60 cents per lb., compared with 30-41 cents average for the 1948 crop.

Exports of cotton from the United States during 1949-50 were expected to decrease moderately from the 4,747,600 bales in 1948-49, but to continue below the prewar rate.

The 1949 crop of 16,034,000 bales, plus a reserve of 5,283,000 bales, provided a total U.S. supply of 21,317,000 bales against a probable domestic consumption of 8 million bales and an export of a possible 4-5 million bales, thus leaving a probable reserve of over 8-5 million bales in Aug. 1950, much of it in the hands of the Commodity Credit Corporation. This mounting surplus resulted in an order from the Department of Agriculture that plantings in 1950 be allocated to producing areas on the basis of a national goal of 21 million ac.—21% less than in 1949. In December growers approved by a 9 to 1 ratio that marketing quotas be established on the 1950 crop, thus loans would continue to be available to co-operating growers at 90% of parity.

World Production. World cotton production continued its upward trend in 1949. The preliminary estimate for the crop for 1949-50 indicated 354 million bales, an increase of 4-5% compared with the 29-1 million bales in 1948. Acreage increased sharply to 68,640,000 from 63,840,000 in 1948, but was substantially below the 81,142,000 ac. of prewar. Mexico harvested 1,334,000 ac. as against 1,050,000 ac. in 1948, producing a record crop of 896,000 bales—more than double the 1940-44 average. Indian production increased to 2.4 million bales from 1,960,000 bales the previous year. Egypt reported a crop of 1,616,000 bales, a 12% smaller crop from an acreage 17% larger than in 1948, a result of a 25% reduction in yields following insect damage. Brazil’s crop was expected to be smaller than the 1.5 million bales produced in 1948.

World reserves of cotton from previous crops increased to 14,769,000 bales from 13,907,000 bales in 1948, but were low compared with the 1935-39 average of 17,352,000 bales. The reserve was expected to increase to about 17,000,000 bales by the end of the crop year, Aug. 1950. Total world consumption was expected to decline about 600,000 bales, the decrease being largely in China; Great Britain, Japan, Germany and France were expected to show increases. (See also Textile Industry.)

COUNCIL OF EUROPE. The year 1948 had seen considerable progress in the unification of Europe. The Brussels treaty marked the first big step. It was followed by the creation of a defence organization under the command of Field Marshal Viscount Montgomery of Alamein with its headquarters at Fontainebleau, France. Meanwhile the European movement, a private organization under the joint presidency of Léon Blum, Winston Churchill, Alcide De Gasperi and Paul-Henri Spaak, had held a remarkable congress at The Hague, Netherlands, which brought together nearly 1,000 delegates from all over Europe. Its most important resolution demanded the creation of a European assembly. Finally throughout 1948 the Organization for European Economic Co-operation had continued its work of drawing western Europe together economically. The ground had thus been prepared for a further advance, but when on Feb. 7, 1949, the Brussels powers—Belgium, France, Great Britain, Luxembourg and the Netherlands—anounced their intention to promote the establishment of a Council of Europe consisting of a committee of ministers and a consultative assembly, the announcement came as a surprise. Few people had expected such an early fruition.

A number of reasons might be suggested for the rapid growth of opinion in favour of greater European unity. The failure of the United Nations to create a condition of general security had convinced large numbers of Europeans that they must provide for their own security by some regional organization. This feeling was sharpened by the fear of communist infiltration, possibly culminating in a Russian sweep over western Europe. The successful maintenance of the position of the western powers in Berlin by means of the air-lift and the recession of the communist parties in France and Italy had done something to allay these apprehensions, but had by no means removed them. At the same time, in spite of the gradual economic recovery which was taking place in western Europe, there was a growing realization of the need for pooling its agricultural and industrial resources, to avoid a serious relapse when Marshall aid came to an end in 1952. It was also becoming clear that the defence and the economic restoration of Europe required a solution of the German problem, which could only be solved by bringing Germany into the framework of a united Europe. Moreover, apart from these immediate considerations, there was a nascent belief that Europe could not maintain its traditional liberties against the assault of totalitarian ideas, unless it reaffirmed its faith and undertook its collective defence. The impulse generated by all these convictions and sentiments was reinforced by the encouragement of the American government and by the pressure of congress.

At the beginning of May the foreign ministers of ten countries—Belgium, Denmark, France, Ireland, Italy, Luxembourg, the Netherlands, Norway, Sweden and the United Kingdom—met at St. James’s palace, London, under the chairmanship of Ernest Bevin, and there drew up the statute of the Council of Europe. It was to consist of a committee of ministers and a consultative assembly, the former to “provide for the development of co-operation between governments,” the latter to “provide a means through which the aspirations of the European peoples may be formulated and expressed.” Every member of the council was to “accept the principles of the rule of law and of the enjoyment by all persons within its jurisdiction of human rights and fundamental freedoms.” The committee of ministers might invite other countries to join the council, either as full or associate members, the latter being entitled to representation in the assembly, but not in the committee of ministers. The control of the organization and the agenda of the assembly rested with the ministers, to whom its recommendations would be addressed and with whom any action to be taken on them or on behalf of the council generally would lie. Subject to these limitations, the assembly might discuss any matter within the scope of the council, that is to say, the promotion of greater unity of its members “for the purpose of safeguarding and realizing the ideals and principles which are their common heritage and facilitating
their economic and social progress." The only subject specifically excluded from the consideration of the council was defence. Each country was allotted a number of representatives in the assembly proportionate to its population, ranging from 18 for France, Italy and the United Kingdom to 4 for Denmark, Ireland and Norway.

The first meeting of the council was fixed to take place at Strasbourg in August. In the meantime, delegates to the assembly had to be nominated by whatever method the government of each country might choose. In Great Britain it was decided to appoint a delegation drawn from all three parties in proportion to their strength. Herbert Morrison and Hugh Dalton for the Labour party, Winston Churchill, Harold Macmillan and Sir David Maxwell Fyfe for the Conservatives, and Lord Layton for the Liberals were the principal nominees. In other countries a similar practice was usually followed, so that, on meeting, the assembly was found to consist entirely of members of parliament representing a wide variety of political opinion. Their domestic differences were to some extent attenuated, however, by the seating arrangement adopted at Strasbourg. Instead of each national delegation being grouped as a unit, the delegates were seated in alphabetical order. Being thus mixed up together without any national labels, they were invited to look upon themselves as representatives of western Europe rather than of their respective countries, a suggestion which had a perceptible psychological influence on the assembly.

When its first session was inaugurated by Edouard Herriot in the hall of the University of Strasbourg on Aug. 10, 12 countries were represented by 102 delegates, including delegates from Greece and Turkey, whose application for membership had been accepted by the committee of ministers. Under the presidency of Paul-Henri Spaak the assembly sat continuously for a month. Its debates in full sitting and in the six committees—political, economic, social, cultural, legal and privileges—covered most of the problems affecting the unity of Europe. As they proceeded, a sense of common purpose developed and with it a corporate consciousness. At the close of its session the assembly had appointed a permanent committee to ensure its continuous existence between sessions and had decided to maintain its six committees in being with the same object in view. The assembly claimed, in fact, to be regarded as a regular parliamentary institution.

The working committees of the assembly produced a large body of recommendations for transmission to the committee of ministers. Not least important was its code of human rights with a European commission and a European court to enforce it. Once this basic charter of European liberties was adopted, it would become binding on every member state, which meant that the preservation of individual freedom and resistance to dictatorship would be not only a national affair but the concern of the whole European community—a powerful safeguard for democracy.

On the economic side the assembly recommended that European trade should be progressively freed from restrictions and that European currencies should be made interchangeable. It further declared that existing economic ties between Europe and its associated countries and territories overseas should be preserved and extended. For this purpose an economic conference between them should be convened, in order to work out common policies as regards trade preferences, foreign investment and the development of natural resources. As a final stage in its economic programme, the
assembly suggested negotiation between the Council of Europe and the United States, in order to reach agreement for the modification of existing treaties hampering intra-European trade and for stimulating a larger flow of exports from Europe to America.

Lastly a vigorous attempt was made to tackle the political difficulties in the way of uniting Europe. By April 30, 1950, the political committee was instructed to report on the "modification desirable in the political structure of the members of the council with a view to a closer unity between them." An indication of the lines on which it should go was given by the resolution declaring that the aim of the council was "the creation of a European political authority with limited functions but real powers" and by a series of amendments to the statute giving greater latitude to the assembly, including the right of approving or disapproving the admission of new members. A great deal of consideration had been given to the admission of Germany as an associate member, for it was recognized that the solution of the German problem was essential to the reconstruction of Europe. The assembly therefore requested that the question of new entrants should be urgently considered by the committee of ministers and should be placed on the agenda of an extraordinary session early in 1951.

The committee of ministers met in Paris on Nov. 3. It regarded any revision of the terms of the statute as premature but agreed that in practice the assembly should be free to determine its own agenda within the limits of the statute and should be consulted before the admission of new members. As the German Federal republic had notified its desire to be admitted to associate membership, the ministers referred this request to the permanent committee of the assembly. That body met on Nov. 7 and approved the German application on condition that the republic affirmed its determination to comply with the statute and expressed clearly its will to abide by it. The committee protested vigorously against the decision of the ministers to provide no funds for the meeting of the committee of the assembly between sessions, and demanded that the experts appointed by the ministers to frame a convention on human rights should take the assembly's draft as a basis. It decided that the committee should meet as intended by the assembly.

The Council of Europe had thus become an established institution, and had begun to exert its influence on the political and economic development of Europe. Though constitutional and other questions remained to be solved, its first meetings marked an important step in the direction of uniting Europe.

BIBLIOGRAPHY. Europe Unite: The Story of the Campaign for European Unity (London, 1949)

COUNCIL OF FOREIGN MINISTERS. The sixth session of the Council of Foreign Ministers, the first to be held since the fifth session had adjourned sine die at London on Dec. 15, 1947, met at Paris from May 23 to June 20, 1949, to consider the basic problems of Allied policy toward Germany and Austria. The session left the three western powers and the Moscow government as far apart as before on the question of Germany but recorded some progress towards agreement on Austria.

The holding of the session was arranged as one part of a four-power agreement, reached on May 4, for the lifting of the Soviet blockade of the western sectors of Berlin and for the removal of Allied counter-measures against trade with eastern Germany. The blockade of western Berlin had been strongly countered by the United States and British airlift, with the support of most of the people of Berlin. Between Feb. 15 and May 4 the U.S. government, with the approval of the British and French governments, had negotiated with the Soviet government, through ambassadors Philip Jessup and Yakov A. Malik, in the search for a way out of this dangerous impasse.

First official information concerning the negotiations came from the Soviet Tass agency on April 26, followed by a fuller State Department release of the same day. The Soviet decision to abandon the blockade in return for a revival of negotiations on Germany marked a definite relaxation of international tension, for the Soviet government thereby acknowledged the right, denied in the negotiations of 1948, of the Allies to occupy Berlin and gave up its claim that all Berlin constituted part of the Soviet zone of occupation. Later difficulties over transportation and currency matters in Berlin, culminating in a new breakdown of four-power negotiations in late September, failed to detract from the basic success of the western powers in asserting their right to remain in control of their sectors of Berlin (see BERLIN).

The German Problem. From May 23 to 31 the four foreign ministers—Dean G. Acheson, Ernest Bevin, Robert Schuman and Andrey Y. Vyshinsky, debated the problem of German unity and Allied control. Vyshinsky urged the re-instatement of the four-power Allied Control council, together with the formation of a German state council, based upon the existing organs already functioning in eastern and western Germany respectively. He again argued for separate four-power control of the Ruhr, with direct Soviet participation, and for large-scale German deliveries of reparations to the Soviet Union. He refused all requests for information concerning the economic condition of the Soviet zone, including the status of Soviet-owned industries, which were estimated to constitute about one-third of the industrial assets of that zone.

Vyshinsky's proposals were met by a western proposal of May 28 for extending to all of Germany the fundamental law, drafted for the Western German state, by holding free elections in the Soviet zone and by guaranteeing personal and political freedom there. The four Allies could then enact a new occupation statute, regulating their relations with the unified German state and reserving only limited powers to themselves, with most decisions of the Allied commission being taken henceforth by majority rather than unanimous vote. Germany would make no reparations deliveries from current production or stocks and Germany would recover ownership of all industrial enterprises taken over by a foreign power since the surrender of May 8, 1945. These proposals were rejected by the Soviet government, and the three western representatives also declined the Soviet proposal that the council receive a delegation of the Soviet-dominated People's congress.

From June 1 to 10 the foreign ministers discussed the problem of restoring a unified administration and currency in Berlin. Again the western members proposed that broad powers be granted to the municipal administration, based on free elections, with its decisions subject to disapproval by the four-power Kommandatura, normally by unanimous vote. Three secret meetings failed to reconcile the widely divergent viewpoints, as the Soviet counter-proposals would have subjected the Berlin administration closely to the Allied Kommandatura, which, in turn, would be able to act only through unanimous decisions. After extensive discussion of the economic problems of Berlin and its relations to the Soviet zone and of relations between the Soviet and western zones, the foreign ministers were unable to reach any definite agreements and merely instructed their authorities in Berlin to consult concerning the expansion of trade and other questions of common interest in Berlin. The council re-affirmed the May 4 agreement which removed the Soviet blockade of Berlin.

The discussion of how and when to draft a peace treaty
for Germany was also fruitless. The Soviet proposals that the four governments prepare a draft treaty within three months and that all occupation forces be withdrawn from Germany one year after conclusion of the treaty seemed designed to win support in Germany. The western negotiators objected that there was little point in promising to prepare a treaty unless the four governments agreed first to re-establish the political and economic unity of Germany, to determine its boundaries, and to decide the questions of reparations and the future status of Soviet-owned properties. The final communiqué, June 20, recorded the failure of the foreign ministers to find any common meeting ground for the restoration of joint control over Germany as a whole or for the economic and political unity of Germany. Despite the statement that the ministers would, during the next session of the general assembly of the United Nations, “exchange views regarding the date and other arrangements for the next session” of the council to deal with the German question, no such arrangements were made during the informal meetings of the four ministers at New York in late September and early October. (See also Germany.)

The Austrian Problem. The Paris session succeeded, however, in removing several obstacles which had blocked for many months the completion of a four-power treaty re-establishing Austria as a free and independent state, as promised in the Moscow declaration of Nov. 1, 1943. Negotiations, begun in London in Jan. 1947, transferred to Moscow, then to Vienna and back to London and broken off in May 1948, had been resumed by the foreign ministers’ deputies in London on Feb. 9, 1949, but were still deadlocked in May by continuing disputes over Yugoslav claims to Austrian territory and to reparations, as well as over Soviet claims to German assets in eastern Austria.

In the last days of the Paris session the Soviet government abandoned the Yugoslav claims; it had previously upheld them, despite the increasingly bitter controversy between the Soviet and Yugoslav Communist parties, beginning in June 1948. In the final communiqué of June 20 the four ministers announced their agreement to re-establish Austria within its pre-Anschluss boundaries, with cultural and administrative protection for the Slovene and Croat minorities. Vyshinsky also abandoned the Yugoslav claim for $150 million in reparations from Austria, while agreeing that Yugoslavia should retain or liquidate Austrian properties within its own territory.

In return for these concessions the western powers made several concessions to Soviet economic interests. Of the German “assets” which had been assigned to Soviet ownership by the Potsdam protocol, certain important items, especially in the fields of oil and Danubian shipping, were now to be assigned to the Soviet Union and, in return for its renunciation of all other claims to German assets, Austria was obligated to pay $150 million over a six-year period. Details of the settlement were referred to the deputies, who were instructed to complete the draft treaty by Sept. 1.

After the agreed protocol had already been issued to the press, Vyshinsky attempted to recall it, in order to insert into the agreed statement a provision assuring the free export of profits of the Soviet enterprises in Austria; this matter was finally left to later settlement. The Yugoslav government denounced the Paris settlement declaring that it would never abandon its claims against Austria and attacking the four governments for again sanctioning the injustice of “the imperialist peace of Versailles.” New rancour was added to the Soviet-Yugoslav dispute when the Soviet government asserted, and Belgrade denied, that the Tito government had

The four ministers at the Council of Foreign Ministers held in Paris, May-June 1949. Left to right, Dean G. Acheson (United States) Andrey Y. Vyshinsky (Soviet Union), Robert Schuman (France), and Ernest Bevin (Great Britain).
negotiated with the British government as early as March 1948 about the renunciation of its claims to Carinthia, without informing the Soviet government.

The final negotiations for the Austrian treaty were not completed by Sept. 1, and the deputies were directed to resume their work on Sept. 22 at New York, where the general assembly of the United Nations was in session. The foreign ministers also met informally, on Sept. 26 and 29 and again on Oct. 6, to settle some of the disputed points. On Dec. 14, after 246 meetings, the deputies suspended their negotiations, to resume them in London on Jan. 9, 1950.

During their New York sessions the deputies completed many of the unresolved provisions of the treaty. They elaborated detailed arrangements for the protection of the cultural and educational rights of the Slovene and Croat minorities in Austria and the use of their languages regionally for administrative purposes. They rejected, however, the Yugoslav demand for full political autonomy for the Slav minority in Austria.

Original Soviet demands for full ownership of German "assets" in eastern Austria would have left the Austrian economy bound hand and foot. Over many months of relentless bargaining the extent of Soviet claims had been considerably reduced, and the Soviet negotiators had also abandoned the demand of extraterritorial status for their enterprises. In the spring of 1949 the deputies agreed to assign to the Soviet Union oil-refining equipment with a capacity of 420,000 tons of crude oil and to transfer to its possession certain physical assets of the Danubian Steamship company located in eastern Austria, as well as in Hungary, Rumania and Bulgaria; by giving up its long-maintained claim to share in the control of the Austrian steamship company the new Soviet position left Austria free to develop its own navigation facilities independently.

At their Paris session the foreign ministers agreed that Austria should be denied the right to nationalize the Soviet enterprises except with Soviet consent. The Paris bargain also assigned to Soviet control 60% of Austria's oil-producing areas, at the 1947 level, under 30-year concessions. In addition the deputies were directed to elaborate a list of oil-exploration regions, specifically selected, in which the Soviet government would be free, during eight years, to conduct explorations and to receive further 30-year concessions for those areas which proved oil. Untapped areas would revert to Austrian control in eight years.

When the negotiations were suspended in December, the main disagreements concerned the method of settling disputes over the interpretation of the treaty; the support of displaced persons located in Austria; and the employment by Austria of foreign technicians. None of these questions had sufficient intrinsic importance to prevent conclusion of the treaty if the four powers could now agree, politically, to recognize Austria's independence and to withdraw their forces of occupation. It was, however, widely believed that Soviet reluctance to complete the final drafting of the treaty was due to the hostile pressure which it was exerting upon Yugoslavia; as long as Soviet troops occupied eastern Austria the Soviet government had the right to maintain "lines of communications" troops in Hungary and Rumania, from whose territory the chief centres of Yugoslavia could be threatened. (See also Austria.)

(P. E. M.)

COUNTRY LIFE. Looking back on 1949 the countryman who has no commitments and limited needs should be hard put to name a year more to his liking. The winter carried over from the last month of 1948 was mild beyond hope or imagining; set to music in the earliest days of January by thrushes, robins and wrens. The return of the song thrushes was the more welcome for they had paid heavy toll to the harsh winter of 1947. Blackbirds seemed a little late and uncertain but above the garden a skylark sang a New Year greeting again and again and, although the woodland mosses and lichens were not as brilliant as in hard seasons, hazels were hanging out their catkins and gorse flamed. February gave a long lease to her "fair maids," winter aconite and elm blossomed early, gold crests were singing, bees were spring-cleaning hives and workers foraging. Brown owls were very vocal and blackthorn was breaking into bloom. Everything was a little before its time, or so it seemed. A sign of the mildness of winter was provided by the holly berries which remained untouched; in March the nests of blackbird and thrush had more than their usual cover, and lambs and plover alike contributed to the music of the hours. April called the swallows early and the house martins followed closely; both stayed rather later than usual. The one matter for concern was the absence from winter of snow and heavy rains. Where was the moisture on which so much depends? The farmer looks to the snow, though it holds up work and additional labour.

One of the few cross country journeys that can be taken nowadays it was possible to note the rapid advance of the machine, invading fields for the first time in their long life as cultivable land. Many resent their coming because they are sending so many horses to slaughter; others are seriously perturbed by their effect upon employment. Mechanized farms that employed three men to the hundred acre can now carry on with one and, be it remembered, most of our rural industries are things of the past; you must travel far to find a blacksmith; thatchers, hurdle-makers and handy men are disappearing.

With the demand for more machinery has come the removal of hedges together with great trees that decorated so many of them, but our insectivorous birds still look for bushes. Even if they had been preserved the plight of insect eaters, native and migrant alike, would have been perilous, for magpies, jays and sparrow-hawks are greatly on the increase. In a certain garden every nest was robbed; they included those of wren, flycatcher, long-tailed tit and, of course, the wood pigeon whose eggs were taken regularly by the red squirrels. It was a relief to see young thrushes and blackbirds ranging the garden as summer ripened, their attacks on all bush fruit that netting could not reach were ignored. Water bowls were replenished regularly but the birds preferred the fruit—clear sign of avian intelligence.

Some March frogs appeared and old countrymen prophesied May frosts; sufficient came to sweep the blossom from low lying fruit trees. One frost actually slipped into June. Then came drought; land baked and market gardens wilted, but if cold, wet weather had been sent in place of hard sunshine complaints must have been more widespread. Certainly the hay crop was exceptional and when a break came in the dry spell damage was negligible. Wheat stood up, barley and oats followed its example, roots improved and the countryside moved to an early and smiling harvest while the minister of agriculture sought quite needlessly to emulate Cassandra. Surely few can have seen more corn fields cleared in August. Straw left by the harvester combines and not worth keeping was being burned on the stubble, and before September was well on her road many tractors were out.

Against the prosperous career of corn and hay must be set a seasonal glut of vegetables that involved many market gardeners in heavy loss without reducing shop prices. Winter cabbages had been ploughed in during January, savoys in March, leeks in March and April, parsnips in April, green
CRICKET

The winter of 1948-49 saw two overseas cricket tours. An M.C.C. side visited South Africa and a West Indies team went to the Indian peninsula. A third of the former team, captained by F. G. Mann, was composed of leading prewar cricketers. Unbeaten throughout their programme and winning the only two finished games out of the five four-day tests that were played, the English team owed much to the enthusiasm and personal qualities of their captain who animated their fielding into a powerful reinforcement of bowling which of itself fell something short of prewar test standard, though R. Jenkins did well with his flighted leg-breaks and A. V. Bedser and C. Gladwin were reliable. The leading batsmen, L. Hutton, C. Washbrook and D. Compton all had very fine figures, Compton in particular achieving records in his eight centuries, his aggregate of 1,781 and an astonishing innings of 300 against N. E. Transvaal made in 181 min., but the rest of the batting rather lacked backbone. South Africa, led by A. D. Nourse, just lacked the quality to present a serious challenge. The captain himself and B. Mitchell had fine batting records, but it was in Mitchell’s case the tempo was often so slow as virtually to preclude a win in four days. A. Melville only played in one test and of the other batsmen W. W. Wade and E. Rowan were of full test match class. Of their bowlers N. Mann and A. Rowan were very steady and the young fast bowler C. McCarthy did very well in his first full season; but there the attack virtually ceased.

The first test match, at Durban, was played on a rain-affected wicket and in the last innings England had to make 128 runs in 135 min.; they got home, amid intense excitement, with a margin of two wickets by a leg-bye off the last ball of the match, after owing almost everything to Hutton’s 83 in the first innings and Compton’s aggregate of 100 for the match. McCarthy’s 6 for 43 in the first innings was outstanding. In the second test on the new ground at Johannesburg Hutton and Washbrook with an opening partnership of 359 beat the previous test match record, Compton made a century and the total reached 608. South Africa replied with 315 and 276 for 2 (E. A. R. Rowan 157 not out). The third game, at Capetown, was funereal and in its last stage South Africa made no attempt to meet Mann’s gesture of leaving them 125 min. in which to make 229 runs. In the fourth, at Johannesburg, Washbrook (97) and A. Watkins (111) were almost entirely responsible for England’s total of 379 and Nourse with 126 not out carried South Africa who were still 122 behind. A century by Hutton enabled Mann to declare, but South Africa, without pursuing victory, easily batted out the 33 hr. left to them. The final game at Port Elizabeth provided something of an enigma: South Africa, to save the rubber, had to force a win, but batted all the first day for 219 and the loss of three wickets and their total of 379 (Wade 125, Mitchell 99) occupied nine hours. England, thanks to a dashing 136 by their captain, headed them by 16, and then on the last day Nourse declared leaving them 95 min. in which to get 172 runs and himself little prospect of victory; this task England achieved with a margin of three wickets just before rain set in for the night.

The West Indies team that visited India in the same winter could look back on their tour with great satisfaction, tempered, it may be, by the recollection of much travelling in great heat and pitches so easy as to make the life of a bowler a nightmare. Of their 19 matches they only lost one against six wins including the only test match that was finished. In one of the drawn games Pakistan put up an impressive performance. For their general success the great strength of the West Indies’ batting was clearly responsible; indeed some judges rated it virtually on a level with that of the famous Australian team of 1948. In spite of an accident to their brilliant and experienced player G. Headley early in the tour, they completely mastered the Indian bowling and even V. Mankad, probably as good a left-hand bowler as any contemporary, found his 17 test wickets costing him 43 apiece. Head and shoulders over all their batsmen stood E. Weekes with a test match average of 111 for an aggregate of 779; after scoring a century in his last test match innings against the 1948 M.C.C. touring side, he proceeded to make further centuries in each of his first four test innings in India, thus establishing a world record. C. L. Walcott, a magnificent driver, J. B. Stollmeyer and A. Rae also had splendid figures; indeed nearly all the side could make runs. India too had strong batting in spite of the absence of V. M. Merchant, their most experienced and accomplished player; though V. S. Hazare headed the averages, R. S. Modi was really the most consistent batsman, and D. G. Phadkar proved himself the leading all-rounder on the side. Against scores of 631 and 639 in the first two test games India in each case followed on but had no difficulty in saving the match. In the third, which broke all attendance records at Calcutta, India, set 431 to win in the last innings, reached 325 for 3 but at no time showed any disposition to risk wickets for runs. In the fourth match their batting broke down badly and they lost by an innings and 193 runs, but the last game produced exciting cricket and was only drawn after the last over had seen India with two wickets in hand, needing only six runs to win. The West Indian bowlers on the phenomenally easy wickets that prevailed were not impressive, though P. Jones and J. Trim had pace and G. Gomez consistency.

In the domestic season in Australia, New South Wales won the Sheffield Shield competition and Sir Donald Bradman typically celebrated his knighthood by scoring yet another century in his testimonial match. A. R. Morris and A. L. Hassett were outstanding as batsmen and a new and formidable fast bowler seemed to have been discovered in A. Walker. A team of English women cricketers, captained by Miss Molly Hide, had a very successful tour of Australia and New Zealand, losing only one of their 28 fixtures but that one the only finished test match in Australia. Miss Hide made over 1,000 runs and five centuries.

The English season of 1949 recalled in its continual sunshine and hard wickets the years 1911 and 1921. Long before it was over the county players, especially the bowlers, were feeling the strain and it served to underline the predominant problem of English cricket—how to satisfy the economic needs of the counties with a full championship programme and at the same time conserve the energies, talent and zest
of her leading candidates for international matches. Chief
interest centred in the visit of a New Zealand team, the first
to come to England for 12 years. Admiringly captained by
W. A. Hadlee and fortunate indeed in their manager J. H.
Phillips, the tourists made friends wherever they went and
no doubt surpassed their own expectations in going through
the summer with but a single defeat—at the hands of Oxford
university—and in holding England to a draw in all four
test matches. For these only three days had been allotted
and at the end of the season it had become clear that with
the present psychological approach to test cricket and in the
absence on either side of bowling of the highest class, no
results could be looked for within these limits. The New
Zealand attack was virtually sustained by three men, J.
Cowie, a fast-medium bowler of great persistency and
stamina, G. F. Creswell, an accurate slow-medium bowler
with the fashionable "in-swing," and above all T. B. Burtt,
who in match after match kept an immaculate length with
his left hand slows and was never really collared, hardly
ever seriously counter-attacked. Supported by splendidly
enthusiastic fielding ably disposed by Hadlee, the New
Zealand out-cricket made the utmost of its resources, but
it was the strength of the batting that really carried the side.
In M. P. Donnelly and B. Sutcliffe they had two of the best
left-handers of cricket history; V. Scott was an angular but
effective opening batsman and W. M. Wallace and the
captain himself players of real experience and tenacity; and
J. R. Reid, F. B. Smith and G. A. Rabone all made runs
at need. Against them the English team, captained in the
first two games by F. G. Mann and in the latter two by
F. R. Brown, could never bowle the Bowling penetration
or the batting aggression to force a win out of what were
potentially superior resources, even when the selectors
challenged all precedent and logic by picking eight bowlers
for the final test match. In the first test match at Leeds
neither the centuries of Hutton and Compton in the first
innings and of Washbrook in the second nor the encoura-
gingly hostile bowling of T. E. Bailey could seriously endanger
New Zealand for whom F. B. Smith did best with 96 and
54 not out. In the second test at Lord's Compton made
another hundred, but a superb 206 by Donnelly gave his side
a lead of 171; even so England were never in danger and
J. Robertson in his first and last appearance in the series
made 121. Two young amateurs stole most of the limelight
in the third test at Old Trafford, Manchester, R. T. Simpson
hitting brilliantly in the last stages of his 103, after England
had opened funerally, and Bailey achieving a fine "double"
with 6 for 84 and 72 not out. For New Zealand Donnelly
was again in form with 75 and 80, Sutcliffe, for the first time
in the series, really asserted himself to the tune of 101, and
Burtt worked indefatigably to take 6 wickets in 45 overs.
When at the end of the second day's play in the fourth
test match at the Oval, England had scored 432 for 4 in
response to a total of 345, there seemed a prospect that
Hutton's 206, an exhibition of classic off-side play, Simpson's
89 and a competent century by W. Edrich had paved the
way for a win, but next day the remaining wickets fell
cheaply and the New Zealanders quietly batted out the match
with determined and collective consistency typical of a team
in which every player had throughout the tour set the cause
above personal honour. When late in September they sailed
for home, they took with them the friendship and good will
of all English cricketers.

The county championship of 1949 provided the most open
and prolonged struggle within living memory. At the begin-
ing of August five counties had some chance of finishing on
top. In a desperate match with Derbyshire at Lord's a
wonderful innings by Compton, when all seemed lost, carried
Middlesex into security, but Yorkshire, playing with some-
thing of the ruthless plen of the county's great days, came
within the last ball of the match when Overton and Robinson
had an aggregate of 3,429, only surpassed three times in cricket
history, was supported by an impressive reinforcement of
young players of whom Brian Close's record of 1,000 runs
and 100 wickets in the first full season rivalled that of
J. N. Crawford in 1906. Surrey, long fancied, fell away in
1949 County Championship Final Placings

First Innings lead in match

</table>

The last matches, but among the lesser counties Worces-
tershire and Warwickshire had fine records, and Northampton-
shire under their new captain F. R. Brown, enjoyed a great
revival.

There was a fine Gentlemen v. Players match in which
runs were always hard to come by; at one time the Players,
set 139 to win, had lost 6 wickets for 60, but spirited batting
by T. Evans and Jenkins won the day. The university match
provided the surprise of the season. Oxford had had a
notable record at home, defeating both the New Zealanders
and Yorkshire, but Cambridge, well led by D. J. Insole and

W. A. Hadlee, captain of the New Zealand touring team in Britain
In 1949, being caught by W. J. Edrich in the final test match at the
Oval; keeping wicket is T. G. Evans.
with two fine batsmen in G. H. G. Doggart and J. G. Dewes, consolidated notably on their tour and at Lord's fairly out-played Oxford to win by seven wickets. Statistically, the outstanding feature of the university season was the partnership of 429 by Doggart and Dewes against Essex, a record for the second wicket in English cricket. Eton, a strong side, were too good for Harrow, and there were some signs of a general revival in school cricket. For the first time representative sides picked from the grammar and secondary schools of England and Wales met in an international match. Lancashire second XI won the minor counties' championship. Other features of the cricket year were the nomination of the Duke of Edinburgh to the presidency of the M.C.C., and the appointment by the M.C.C. of a special committee to enquire into the problem of bringing more and better cricket into the lives of the boys of England from secondary school age until the time of their call-up for national service.

(H. S. A.)

**CRIME.** In 1948 the number of persons in Great Britain found guilty of offences other than against defence regulations was 656,950, of whom 129,384 had committed indictable offences and 527,566 non-indictable offences, a rise of 11.9% compared with 1947 for indictable and of 5.8% for non-indictable offences. In addition, 20,163 persons were found guilty of offences against defence regulations, against 18,863 in 1947. Of these, 89% had committed black market, especially rationing, offences, compared with 83% in 1947. About half the total of persons found guilty had committed traffic offences; viz., 49.6% against 52.8% in 1947. The number of those guilty of larcenies remained fairly constant at slightly over 12% and that of sex offenders at 0.6%. Excluding certain categories of indictable offences which are considered separately, the highest increase, i.e., 27%, was found among offenders guilty of violence against the person. The highest increases in non-indictable offences referred to drunkenness (31,260 as against 23,762) and prostitution (5,647 against 5,041). The figures quoted, however, referred to court appearances only and did not necessarily mean as many different individuals.

Indictable offences known to the police increased from 498,576 in 1947 to 522,684, as against 283,230 in 1938. Of them, 215,942 were cleared up during the year. Of 147 cases of murder of persons aged one year and over, 130 were cleared up during the year and 109 persons were charged. In 34 cases the murderer or suspect committed suicide; in 43 cases he was found insane. With regard to age, the increase over 1947 was highest for offenders under 17, i.e., 24%, and only 6% for those over 17 (indictable offences). With regard to sex, the increase was smaller for females than for males.

Probably the most sensational murder trials of the year were those of John George Haigh, sentenced to death for the murder of a widow aged 69, whose body he was stated to have dissolved in an acid bath after the murder, and of Daniel Raven, sentenced to death for the murder of his parents-in-law.

Methods of dealing with offenders changed but little compared with 1947. There were ten executions for murder. Imprisonment was used for adults in 22% of all indictable cases by magistrates' courts and in 71% by assises and quarter sessions. For those between 17 and 21, imprisonment was slightly less frequently used than before. The daily average prison population showed a considerable increase, from over 17,000 in 1947 to 20,000 in 1948, whereas receptions over the whole year went up from 44,390 to 48,827. This was due in part to the fact that, although no greater proportionate use was made of prison than previously, the absolute figures of offenders were higher; in part, however, it was due to a general lengthening of prison sentences. Fines maintained their record figures (52% for adults, 36% for the 17 to 21 group, 16% for adolescents and 12% for children). Perhaps the most interesting feature was that the downward trend in the application of probation, noticeable in postwar years, was halted. After declining from 32% in 1938 to 20% in 1937 (males of all age groups), it rose to 22% in 1948 and the absolute figures of persons placed on probation rose from 19,937 in 1947 to 24,386 in 1948.

In Scotland the total of persons convicted or found guilty in 1948 was 89,459, which was 1,335 more than in 1947. 81,182 of them were male, which constituted an increase of 2,032, and 8,277 female, which showed a decrease of 697. Persons under 17 numbered 19,812; i.e., an increase of 15.6% over 1947. The total number of crimes and offences known to the police was 172,129, or 2.6% more than in the previous year. The average prison population showed only a slight increase from 1,889 to 1,902 and receptions went up from 14,126 to 14,460. Three persons were sentenced to death but there were no executions. The use of probation increased from 4,270 to 5,572.

**Europe.** Reliable and comprehensive statistical information was unobtainable for most eastern European countries and for Germany where criminal statistics were still not re-organized after World War II. However, figures available for several western and northern European countries indicated certain trends.

**Belgium.** The prison population declined from 21,891 in 1947 to 15,746 in 1948.

**The Netherlands.** Crimes known to the police numbered 49,061 in the second half of 1948 and 41,853 in the first half of 1949. Of this total, slightly more than 70% were crimes against property, whereas sexual offences numbered about 7% and offences against the person about 13%. The number of prison inmates present in the course of the year increased from 37,330 ordinary and 10,390 political prisoners in 1946 to 43,754 ordinary and 18,479 political prisoners in 1948, the increase in the latter category being due to technical factors related to the administration of criminal justice rather than to an actual rise in political crime.

**Scandinavian Countries.** In Sweden, the total of crimes per 100,000 of the population was 341-4 in 1947 against 349-6 in 1946 and 225-5 in 1940. In Norway, the absolute figures were 5,731, or 186 per 100,000, for 1946 (published in 1948), against 4,698, or 154 per 100,000 in 1945; about three-quarters of them were crimes against property.

**United States.** The number of crimes committed in urban areas rose in 1949, thus reversing the downward tendencies noted in 1948; the rise in rural robberies cancelled out the trend in the urban centres. The numbers of crimes recorded in the various areas are shown in the following table (Table I — Crime in 1948 and 1949 in U.S. Cities and Rural Areas January 1, 1948 to June 30, 1949)

The increase in number of crimes is primarily the result of a decline in the preceding year and rural burglaries and larcenies played their part in the rising crime wave. Car thefts in both city and country continued to decline as did the number of homicides.
CRIPPS—CYCLING

Table I includes crimes committed in 2,081 cities and towns having a total population of 58 million, and rural areas comprising 39 million inhabitants. Based upon these figures, the total number of offences of the types listed in Table I committed in the United States during 1948 was estimated at 1,686,670. Reduced to daily averages, 36 persons were slain feloniously, 255 were victims of rape or assault with a lethal weapon and 150 persons were robbed by means of personal force or threats. In an average day, there were also 1,032 burglaries, 463 car thefts and 2,672 miscellaneous larcenies. (Br. S.)

CRIPPS, SIR (RICHARD) STAFFORD, British statesman and lawyer (b. London, April 24, 1889), was appointed chancellor of the exchequer on Nov. 13, 1947, after the resignation of Hugh Dalton. (See Britannica Book of the Year 1949.)

The heavy strain of his work as chancellor, with responsibility for both financial and economic affairs, caused him in July 1949 to visit Switzerland where he stayed a few weeks undergoing treatment for a digestive complaint. On April 6 he presented his budget to the House of Commons and, because of the continued rapid drain on Britain’s dollar reserves, he presided over a meeting of the Commonwealth finance ministers in London in July. This was preceded by talks with John Snyder, United States, and Douglas Abbott, Canada. In September Sir Stafford visited Washington for further financial talks between the three countries; and he also represented Great Britain at the annual meetings of the International Bank for Reconstruction and Development and the International Monetary fund. He returned to Great Britain on Sept. 17 and the following evening announced in a broadcast that the government had decided to devalue the pound. He visited Brussels and Paris many times during the year for meetings of the Organization for European Economic Co-operation and of the finance ministers of the Brussels treaty powers. In April he visited Italy where he had talks with Italian ministers.

CUBA. An island republic in the Caribbean sea, including the island of Cuba, the Isle of Pines, and other minor islands and keys. Area of the main island: 44,217 sq. mi. (Isle of Pines, 1,180 sq. mi.). Pop. (Dec. 1947 est.): 5,295,000. Racial distribution is officially calculated at 75% white (about one-third of this group is mulatto), 24% Negro and 1% Asiatic (largely Chinese). An estimated 200,000 Spaniards live in Cuba. Havana (pop., 1949 est., 800,000) is the capital and chief port. Other chief towns (pop., 1946 est.): Santiago de Cuba (152,000); Camaguey (87,000); Matanzas (55,000). Language: Spanish. Religion: predominantly Roman Catholic. President of the republic, Dr. Carlos Prio Socarrás; prime minister, Dr. Manuel A. de Varona.

**History.** The development of Cuban affairs during 1949 was uneventful. Public discussion was chiefly focused upon economic and financial position. The outlook for the marketing of sugar was clouded early in the year; but gradually the entire surplus was disposed of and the year ended with a prospect of marketing the larger crop which favourable weather was foreshadowing for the season 1949-50.

During 1949 the volume of imports declined by 10%; bank clearings were down slightly more than seasonally through the year and both price and wage levels rose. Some industrial expansion, however, took place; and there were indications of renewed mining activities. The search for oil, sporadically promoted in former years, became more intense. The construction of an oil refinery was carried forward. Road building progressed and some steps were taken toward the rehabilitation of railway rolling stock and railway bed. The availability of construction materials from the United States spurred the construction of new housing (chiefly multiple) in the capital and provincial towns.

There was a perceptible increase in apprehension over the stability of various trust funds established to support industrial pensions and the government disability system. On Oct. 11 the president announced a comprehensive financial programme, seeking congressional authorization to contract a long term loan for as much as 200 million pesos. This borrowing would involve refunding only in insignificant measure, as initially projected, and would envisage a programme of extensive public works of new highways, new housing for urban and agricultural workers, port improvements, aqueducts and irrigation and an intensive cultivation of the tourist business. The debates brought little to light as the practical programme was under study by Congress on Nov. 17, the borrowing was authorized. Discussions with financial groups in the United States began before the end of the year. Progress was made toward a treaty with the United States for the elimination of the double taxation of income.

The closing months of 1949 were overshadowed by serious difficulties with the Dominican Republic (q.v.). The government of the latter alleged that Havana was the centre of conspiracies to organize expeditions to overthrow the Dominican regime. The Cuban congress met in special session at the end of December to confer emergency powers upon the executive in the event of attack. The Organization of American States was officially requested to investigate the charges. (C. McG.)

**Education.** Schools (1945) elementary and secondary: state, pupils 498,286; private, pupils 72,000. There were 21 institutions for advanced education and the University of Havana.

**Agriculture.** Cuba is the world’s chief exporter of sugar. Production in 1948 was 1,186,670 tons of raw sugar (17% of world production) and 340-8 million gal. of strap molasses. Other main crops (short tons, 1948): leaf tobacco 28,000; coffee 36,440; pineapples 186,000; rice (milled) 44,000. Livestock (’000 head; July 1, 1946): cattle 1,154,190; pigs 1,338,913; sheep 154,141.

**Industry.** There are 160 sugar mills throughout the island. Other production in 1948 included: cigars 620 million; cigarettes 7,691 million; cement 1,676,200 barrels; cotton piece goods 38-9 million yd. Refractory chromite (1948): 109,612 long tons. Other minerals include copper, gold, zinc and iron ore.

**Foreign Trade.** (Million pesos, 1948) Export 5,709-8; import 5,527-8. Chief exports: sugar (82%), molasses (5%) and tobacco (4%). Chief imports: rice, butter, flour. The U.S. supplied 79-7% of the total imports and absorbed 51-6% of the exports.

**CURAÇAO:** see NETHERLANDS OVERSEAS TERRITORIES.

**CYCLING.** In 1949 for the first time a British rider won the world professional sprint championship. The races
The Isle of Man 75 mi. road race in June was won by Desmond Robinson (Huddersfield). The national massed start championship in September was won by A. D. Newman (Concorde R.C.C.), second in the race in June.

Peter Beardsmore (Medway wheelers) broke the London to Brighton and back record, when, on Oct. 2, he covered the 104 mi. in 4 hr. 36 min. 8 sec. Two weeks later Kenneth Joy reduced the time to 4 hr. 34 min. 13 sec.

In June, H. Parkes (Medway road club) set up new figures for the Land's End to John O'Groat's tricycle record when he covered the 872 mi. in 3 days 13 hr. 3 min. A month later J. K. Letts (Ealing Paragon) recorded a time of 3 days 9 hr. 27 min. During the year Albert Crimes (Crewe wheelers) established new tricycle competition record figures for events at 50 mi., 100 mi., 12 and 24 hr.

C. G. Baxter and R. T. Coleman (South Lancashire R.C.) established new figures of 9 hr. 22 min. for the Liverpool—Edinburgh tandem record.

(R.C.)

CYPRUS. British colony and island in the eastern Mediterranean lying south of Turkey and west of Syria and Lebanon. Area: 3,572 sq. mi.; pop. (1946 census): 450,114. Chief towns: Nicosia (cap., 34,463); Larnaca (14,746); Limassol (22,693); Famagusta (15,912). Languages: Greek 80%, Turkish 20%; English also is spoken by some 10%.

Religions: Greek Orthodox 80%, Moslem 20%. Governor, Sir Andrew Wright.

History. A report published during the year on the progress of the ten-year development plan showed an expenditure of £1,178,036 on various projects in the 2 years and 9 months since its inception; irrigation, at a cost of £313,915, was the largest single item. Formal announcement of the success of the anti-malarial campaign was made on April 4, when it was claimed the island had been cleared of the malarial mosquito at a cost of £220,000, or approximately 9s. per head of population.

Municipal elections were held during May and resulted in slight gains for the right-wing parties which gained control of three main towns and seven rural centres or municipalities. But political agitation for enosis, or union with Greece, now supported equally by both right- and left-wing parties of the
Greekspeaking community, continued to bedevil the political life of the island and prevent any constitutional advance.

The island's economic position, with a very large adverse trade balance, gave rise to serious concern, especially as the cessation began to be felt of those war-time and immediate postwar circumstances which had favoured certain of its products: e.g., wine, and the government took various steps to secure new markets abroad and to aid threatened industries; a trade delegation was sent to London in July and later a scheme was published for the purchase by the Government of the season's entire acceptable production of raisins and zivania.

The interim report was published of the committee on Turkish affairs which had been carrying out an investigation into matters concerning and affecting the Turkish community in Cyprus. It was an all-Turkish committee and, bearing in mind that it dealt with an all-Moslem community, it recommended certain far-reaching reforms including the abolition of polygamy, the discontinuance of the dowry system, restricted divorce subject to a judicial decision and reconstitution of the Sheri courts under a modern name and modern laws: there were numerous other recommendations dealing with pious foundations (evkaf), the mufti and education more peculiar to existing conditions in Cyprus than to the advocacy of changes in popular Moslem custom.

**Finance and Trade.** Currency: the Cyprus pound, at par with sterling and divided into 180 piastres. Budget (1948): revenue £5,915,985; expenditure £5,812,952. Foreign trade (1948): imports £15,422,091; exports £3,678,617. Principal exports, minerals (copper concentrates, iron pyrites and asbestos) and agricultural products. (J. A. Hu.)

**Cyrankiewicz, Józef,** Polish politician (b. Tarnów, 1911), appointed prime minister on Feb. 5, 1947. (For his early career see Britannica Book of the Year 1949).

On Dec. 21, 1948, after the merger of the Socialist and Communist parties, he was elected one of the three secretaries general of the new Polish United Workers' party. On Jan. 10, 1949, in the Polish parliament or Sejm, he said that the main object of U.S. aid to Europe was to restore aggressive German imperialism. On Sept. 1, in opening the Warsaw congress of the Fighters for Freedom, he attempted to present a synthesis of recent Polish history: from 1919 to 1926 Poland was a pseudo-democracy, from 1926 to 1939 a fascist dictatorship and from 1945 it was, he said, a true democracy. Speaking in November before the central committee of the United Workers' party, he bitterly criticized the opportunism and nationalism of his former Socialist party and alleged that many of its leaders were spies and agents provocateurs.

**Cyprienca:** see ITALIAN COLONIAL EMPIRE.

**Czech Literature.** Under the Communist regime Czech literature left the well trodden paths of the fashionable "isms" and was clearing the ground to elucidate the principles of socialism, he attempted to present a synthesis of recent Polish history: from 1919 to 1926 Poland was a pseudo-democracy, from 1926 to 1939 a fascist dictatorship and from 1945 it was, he said, a true democracy. Speaking in November before the central committee of the United Workers' party, he bitterly criticized the opportunism and nationalism of his former Socialist party and alleged that many of its leaders were spies and agents provocateurs.

A somewhat wider background was given by Dominik Tatara, a Slovak, to his novel Parochial Republic describing community life in Slovakia during World War II; but socialist realism was still in a theoretical and transitional stage. Adolf Branald's first novel North Station showed how passionately Czech railwaymen opposed the German invaders. The leader of these fighters, however, was a crankish stationmaster who regarded sabotage as the ruin of railway property and longed for nothing more than the return of bygone times with their forms and circular letters.

Branald's second novel, Hospital Train, another picture of the occupation years, was set against the brutality of Nazi officers. The literary solution of topical problems was attempted by Jiří Mucha in The War Continues, a chronicle of the after effects of war on men's minds as a result of changed political conditions, by contrasting the character of a "builder" with that of a man who flees abroad.

The one really outstanding volume of poetry published in 1949 was František Hrubín's Hiroshima. It met with an unfavourable reception because of the poet's sense of resignation, his lack of optimism and his vision of the world as reflected in the fate of Hiroshima. František Halas whose last volume of poems professed itself, as its title read, In Line, died in October.

The new tendencies were strongest in drama. A two-year plan of sorts, which began on July 1, 1949, now existed to make scenic art a national affair in which all theatres and playwrights would collaborate. The latter were to write according to local needs. Metropolitan theatres would be expected to produce plays about the fight for peace or the birth of a new intelligentsia and theatres in industrial centres to stage plays on shock workers or the fight for production. Among original new plays, about 20 in all, Politburo Kart's Gang by Vášek Káta might serve as an indication of present trends in Czech drama. It was an authentic play in racy language about metal factory workers with well drawn characters typifying both the positive and negative aspects of one sector of Czechoslovakia's everyday life. Among miners' plays there was Václav Jelínek's comedy And Who Is More Important?, the hero of which, an old miner, has only one ambition—to find someone to replace him in the pit. In November a first play New Fighters Will Come by Antonín Zápotocký, the prime minister, was performed in Prague.

**Czechoslovakia.** A people's republic of central Europe, bounded on the west and northwest by Germany, on the north and northeast by Poland, on the east by the U.S.S.R. and on the south by Hungary and Austria. Area: (before Sept. 28, 1938) 54,244 sq. mi.; after annexation of Subcarpathian Ruthenia by the U.S.S.R. (June 29, 1945): 49,330* sq. mi. Pop.: (June 31, 1945) 15,239,000; (May 22, 1947, census) 12,164,631; (Dec. 31, 1948, est.) 12,408,982.* The population of Subcarpathian Ruthenia was estimated in 1938 at c. 725,000; after the liberation over three million Germans left the country, but about 434,000 remained. Languages (official 1948 est.): Czech 67%, Slovak 25%, German 3-5%, Hungarian 3-5%, Polish 0-7%. Religions (1930 census): Roman Catholic 77%, Protestant (all denominations) 7-5%, Czechoslovak Church 5-6%, Greek Catholic 1-6%, Jewish 1-9%, atheist 6%. Chief cities (pop. 1947 census): Prague, 1,474,451; Brno (272,760); Moravská Ostrava (181,811); Bratislava (172,664); Plzeň (118,152).

President of the republic, Klement Gottwald (q.v.); prime minister, Antonín Zápotocký (q.v.); minister of foreign affairs, Dr. Vladimir Clementis.

**History.** The main political event in 1949 was the conflict between government and Roman Catholic Church. The hostility of the hierarchy to the rump People's party, the purged remnant of the formerly strong party of Catholic democrats, and to the person of its leader, the suspended Catholic priest Josef Plotr, a member of the Zápotocký cabinet, had caused serious friction in 1948. Discussion between government and hierarchy for the settlement of outstanding problems began in Feb. 1949 but broke *including the so-called Bratislava bridgehead ceded to Czechoslovakia by Hungary under the Paris treaty of peace of Feb. 10, 1947. It comprises three villages with a total area of 9 sq. mi. and a population of 3,146 (Oct 15, 1947).*
down without agreement. The failure was attributed by the government to Vatican intervention, by the hierarchy to unacceptable interference by the government with church affairs. On June 9 the government set up a body called the Catholic Action committee. It had nothing to do with the Catholic Action organization, but was a Communist-controlled "action committee" similar to those which had been set up at the time of the Feb. 1948 "revolution." It included a number of lay Catholics and some priests, and issued a newspaper called Catholic News. Its purpose was to persuade Czech Catholics that the government wished to respect and protect their religion but that the reactionary bishops and the Vatican "in the service of western imperialism" were out to prevent agreement. Archbishop Josef Beran of Prague denounced the committee, and threatened all who supported it with "ecclesiastical sanctions." The archbishop's sermon in Prague cathedral was interrupted by Communists on June 19; and he became a prisoner in his own palace. On July 15 a draft law was published, which provided for the payment of priests' salaries by the state, on comparatively generous terms, but gave the government power to interfere in the church appointments and to take action against priests considered hostile to the "popular democratic regime." The law was passed in October and the hierarchy permitted priests to accept salaries under it as they would otherwise be unable to keep alive. The conflict between church and government was, however, in no way solved. The government controlled the schools and avowedly intended to use them to propagate among the young the "scientific doctrine of Marxism-Leninism." At the same time the government clearly intended to separate at least a part of the Czech Catholic Church from the Vatican. A "national" Czech church could receive sole recognition and, isolated from the outside world, would be as much at the mercy of the state as was the Orthodox Church in the U.S.S.R. Hitherto, with very few exceptions, the Czech and Slovak priests remained loyal to their bishops, and the people to their priests.

The year was marked by a series of conspiracy trials. On Jan. 28 General Heliodor Pika, former head of the Czechoslovak military mission in Moscow and later assistant chief of staff, was condemned to death for espionage. One of the accusations against him was that in 1940 he had passed to the British information about the Red army. At that time Britain was the only fighting ally of his conquered country, while the U.S.S.R. was the ally of its oppressor. If the general did in fact pass information to the British, then he was condemned for treason against Hitler's protectorate. The sentence of death was carried out on June 21. Another war hero, General Karel Kutlvaš, organizer of the 1945 rising of Prague against the Germans, was sentenced to life imprisonment on May 16 for espionage on behalf of foreign powers. On Aug. 30 it was announced that another insurrectionary plot had been unmasked; six persons were executed and ten sentenced to life imprisonment. In March, Captains Philip Wildash, British military permit officer for the western zones of Germany, was arrested by Czech police on a charge of espionage. A number of Czech subjects were subsequently condemned to various prison sentences for providing him with information. In October a member of the U.S. embassy, Samuel Meryn, was also arrested on espionage charges.

The 9th congress of the Czechoslovak Communist party was held in May. After its last congress in 1946, the party's membership had risen from 1,159,164 to 2,311,060. The increase was due mainly to the recruiting campaign before and after the Feb. 1948 "revolution" and obviously consisted to a large extent of unreliable careerists whose devotion to Communism was hardly even skin-deep. In the first months of 1949 a "verification" of members was carried out. But at the time of the congress, though more than 500,000 had been reduced to "candidate" status, only 100,000 had been expelled. Clearly this purge was inadequate and more drastic action was bound to follow. The Rajk trial in September (see HUNGARY) "revealed" that nationalistic deviationism and Titovism were rife in the Czech party. During October large numbers of arrests were carried out, including those of many party members but no prominent leaders.

Perhaps the most significant change in Czechoslovakia's foreign relations during 1949 was the adoption in official circles of a new attitude to Germany. As Soviet policy increasingly organized eastern Germany into a centralized Communist state and gave more support to German nationalism—directed of course against the western powers—the old negative attitude of the Soviet satellites to Germany became impossible. Already in February Zdeněk Fierlinger, who had attended a congress of the S.E.D. (Communist) party in the Soviet zone, urged a friendly attitude to the new true democracy which was arising in Soviet Germany. At the party congress in May, Václav Kopecký, minister of information, stated that the test of the "true proletarian internationalism" of Czech Communists would be their relations with the "democratic and progressive elements and popular sections" of Germany whose spokesman was S.E.D.
The Czechoslovak-Hungarian quarrel, fostered by Czech and Slovak Communists in 1945-47 in the tactical interests of Soviet policy, was buried in those same tactical interests in 1949. Agreement was reached on the position of the Hungarian minority in Czechoslovakia and a Czechoslovak-Hungarian treaty of friendship and mutual assistance was signed in Budapest on April 16, 1949, by the two prime ministers, Jvatán Dobi and Antonín Zápotocký, and of ministers of foreign affairs, Vladimir Clementis and Lászlo Rajk.

Economy in 1948-49. Elementary schools 11,836 pupils 998,177; higher grade schools 2,122, pupils 398,721; secondary schools 335, pupils 119,093; technical schools 700, pupils 99,781; universities 7, students 52,456; other institutions of higher education 9, students 5,420.

Agriculture. Main crops (1948, in '000 metric tons): wheat, 1,398; rye, 1,124; barley, 925; oats 908; maize 252; potatoes 6,578; sugar (raw value) 629. Livestock (in '000 head): cattle (Jan. 1948) 3,275; pigs (Jan. 1948) 2,566; horses (Jan. 1949) 640; sheep (Jan. 1948) 386; chickens (Jan. 1948) 10,976. Food production (1948, in '000 metric tons): milk, 2,258; butter 22-8; meat 264 (beef 118-8).

Industry. Persons employed in industry, excluding building (June 1949): 1,395,000. Fuel and power (1948, six months, in brackets): coal (in '000 metric tons) 17,746, (6,484), lignite (in '000 metric tons) 23,391 (13,137); manufactured gas (in million cu. ft.) 72,818 (39,128); electricity (in million kw. h.) 7,514 (4,046). Raw materials (in '000 metric tons): iron ore, metal content 1948) 1,429; pig-iron (Jan. to Nov. 1948) 1,515; steel ingots and castings (Jan. to Nov. 1948) 2,425; lead (1948) 8. Manufactured goods (1948, 1949, six months, in brackets): '000 metric tons 131 (62), rayon (in '000 metric tons) 18 (11); footwear (in million pairs) 63 (34); railway trucks, coaches and motor trains (in thousands) 11 (9); commercial vehicles (in thousands) 14 (cement (in '000 metric tons) 1,657 (823).

Foreign Trade. (In million korunas) Imports (1948) 37,716, (1949, six months) 20,280; exports (1948) 37,648, (1949, six months) 20,160.

Main sources of supply (1948): U.S.S.R. 16% United Kingdom 10% and Yugoslavia 6%. Main destinations of exports (1948): U.S.S.R. 1 0. Poland 7% and Yugoslavia 7%.

Telephones (1947), subscribers 350,108.

DAHOMEY: see FRENCH UNION.

DAIRY FARMING. There were 3,685,000 cows on farms in the United Kingdom in June 1949, 101,000 (2-7%) more than in June 1948. The number in milk increased by 4% so that, in spite of poor pasture conditions, sales of milk through Milk Marketing boards during the period April to Sept. 1949 were maintained at 2% above those in the corresponding period of 1948. Sales in the period Oct. 1948 to Sept. 1949 were 1,711 million gal., 10% more than in the period Oct. 1947 to Sept. 1948 and 42% more than the prewar average. Some 10% more cows were dry, ready for calving, in Sept. 1949 than in Sept. 1948, indicating that the trend towards increased autumn calving fostered since the early days of World War II was continuing. The dry summer greatly reduced supplies of grass and other forage crops, making it difficult to feed autumn calvers satisfactorily. To help farmers to prepare these cows and heifers for calving a special allowance of concentrate feedingstuffs was made for them through the feedingstuffs rationing scheme. Producers were warned, however, that they must plan to grow an even bigger proportion of the feed for their cows than they had in the past.

The price of milk in the year Oct. 1948 to Sept. 1949 was 238% of the average for the years 1936-38. The price in December was 182% of that in May compared with 166% prewar, reflecting the emphasis in recent years on winter production.

Though the large supply of milk in 1948-49 was to some extent the result of a very favourable season, it turned producers' attention to the prospective outlets for their production in the future. Consumption of liquid milk per head of the population in the United Kingdom was smaller than in several countries in continental Europe but total consumption had, nevertheless, increased by 75% over prewar. Towards the end of the summer of 1949 it became very difficult to meet demands for liquid consumption, but this extreme stringency was temporary and did not change the general view that production was expanding steadily. This prospect, together with the need to expand meat production, led to official approval for the return to calf-raising of relatively inaccessible farms which had changed to milk selling only since 1939; the regular cash return from milk was, however, a strong attraction to these farmers and there was little evidence of reversion.

UNITED STATES. Production of milk in 1949 was estimated at nearly 118,000 million lb., compared with 115,500 million lb. in 1948. The number of milk cows at the beginning of the year was 24,450,000, and 25,039,000 in the previous year. A general decline in the price to the farmer for milk and milk products was in evidence; prices per cwt. were nearly 20% below those of 1948. Retail prices averaged about 1 cent a quart lower than in the previous year. Consumption per person of milk in all forms dropped to 742 lb., almost the lowest recorded. The Agricultural act of 1949 provided for the subsidy of milk and butter fat prices, but the prices fixed were below those actually received by farmers in Dec. 1949.

Consumption of butter increased by about 3% in 1949, but the 10-3 lb. used per head was only 62% of prewar consumption. Production was estimated at 1,675 million lb., compared with 1,513 million lb. in 1948. The U.S. production of cheese in 1949 was estimated at 1,190 million lb., as compared with 1,097 million lb. in 1948 and an average of 669 million lb. in 1935-39. Production per head was 7-9 lb. compared with 7-4 lb. in 1948 but consumption was estimated only at 7-1 lb. per head in 1949. Prices were comparatively stable near the government subsidized price and ranged from 37-1 cents per lb. wholesale at Chicago in January to 33 cents per lb. in July, compared with an average of 45-5 cents per lb. in 1948.

Production of non-fat dried milk solids in 1949 was a record of 885 million lb., compared with 659 million lb. in 1948 and 243 million lb. before World War II. Domestic requirements were only a little more than 50% of production, so the 100% of the output in 1949 was purchased by the government as a price support measure for manufacturing milk. Production of dried whole milk was 130 million lb. in 1949 compared with a peak of 217 million lb. in 1945 and a prewar level of production of only 19 million lb. Domestic consumption accounted for less than half the total. Production of evaporated milk amounted to 3,395 million lb., compared with 3,831 million lb. in 1948.

DAKAR: see FRENCH UNION.

DANCE. The year 1949 was an important one in ballet not only from the point of view of quantity but especially for a definite trend that was beginning to show itself. As usual the bulk of the work came from France and Great Britain.

The ballet of the year was beyond a doubt Carmen produced...
Margot Fonteyn as Cinderella. She was a member of the Sadler’s Wells Ballet company which appeared in New York late in 1949.

by Roland Petit for his own Ballets de Paris. This work which had its world première at the Princes theatre, London, on Feb. 21 ran nightly all through the summer at the Marigny theatre in Paris, breaking every previous record. The company left for New York in October. Its basic weakness was the adaptation of Georges Bizet’s score but, that accepted, the result was first class theatre and very nearly first class choreography. Petit told Prosper Mérimée’s famous story in five scenes with a realism hitherto unknown in the ballet medium; the characters of Carmen and Don José were well brought out and there was an amusing sketch of Escamillo in the background. The scenery and costumes by the Spanish painter A. Clavé were outstanding, a part of the dramatic entity as they so rarely had been since the time of Sergei Diaghilev. Renée Jeanmaire, always an admirable dancer, became so closely identified with this role that she ran the danger of playing a whole series of femmes fatales. Petit’s other creations were commonplace and showed the weakness inherent in his tendency for improvisation.

The other ballet of major importance was Frederick Ashton’s Cinderella, put on by the Sadler’s Wells ballet at the Royal Opera house, Covent Garden, on Dec. 23, 1948, and played to capacity at each performance. This was the first full length ballet created by a British choreographer. The problems involved were many, the most complex of all being the telling of the story without the conventional mime used in the 19th century which would irritate a modern audience. The music was by Sergei Prokofiev; another version had already been produced in Moscow. Ashton told his story in a straightforward manner adopting a neo-classical technique that suited both the music and the times. Originality was shown in the variations of the four seasons and in a simple and moving dance for Cinderella with her broom. A feature of the production was the heavy character comedy of the ugly sisters danced by Ashton himself with Robert Helpmann. This knockabout type of British pantomime, so foreign to the average European, finds an echo in Russia and the music allowed Ashton to make the most of it. It did, however, outweigh the dancing especially when, with repeated performances, the comedy broadened. The scenery and costumes were by the Parisian designer Jean-Denis Maïciles. The role of Cinderella was created by Moira Shearer during Margot Fonteyn’s illness; it was also danced by Violetta Elvin and finally by Margot Fonteyn herself for whom it had been originally created. This ballet was chosen for the Ballet Benevolent Fund Gala performance at Covent Garden on April 25 at which the Queen was present.

Sadler’s Wells revived Frederick Ashton’s Wedding Bouquet, Apparitions and Façade. The first two works survived their transfer to a larger stage and their quality ensured them a long life in the repertoire.

In October the company made its American début at the Metropolitan Opera house, New York, and played to full houses. It received unanimous praise from the critics.

Alexandra Danilova returned to the London stage for the first time since 1939 as guest artist at Covent Garden in Coppélia, La Boutique Fantasque, Giselle and Swan Lake, an event of considerable importance for the young dancers with whom she appeared.

The Sadler’s Wells theatre ballet, nursery of the Covent Garden company, continued its search for fresh talent. Its best production in 1949 was Sea Change by John Cranko to Sibelius’ En Saga with costumes and scenery by John Piper. This ballet, in spite of grave weaknesses such as the placing of the inhabitants of a fishing village on their points, showed that Cranko was a choreographer with musical sensitivity who could tell a dramatic story with clarity and coherence.

In Paris the ballet at the Opéra marked time with certain lavish productions by Serge Lifar which failed to attract much critical appreciation. The most charming revival was Extre Deux Romes in which Lifar gave the leading role to a young dancer, Josette Clavier which resulted in a heated controversy since she was promoted for the purpose above the heads of the established premières danseuses and solistes. It was a healthy sign that Lifar should be making a breach in a hierarchic system that had stultified so much of the work of a very strong company. Lifar himself danced once again in certain ballets from his own repertoire, the outstanding being Icare. In October it was officially announced that the première danseuse étoile, Yvette Chauviré, France’s outstanding dancer, had been suspended for a breach of discipline in accepting outside engagements. A week later the announcement appeared that Nina Vyroubova, formerly of the Ballets des Champs Élysées, had been engaged as an étoile.

The other important French company, the highly creative Ballets des Champs Élysées, toured South America and Europe, spending three weeks in Edinburgh for the festival. For Edinburgh and London it had greatly increased its strength by the return of Nina Vyroubova. With Irène Skorik who had led the company from its inception, this gave it two of the outstanding contemporary ballerinas of the day and the public a chance of discussing their respective interpretations of La Sylphide.

The Grand Ballet de Monte Carlo, after its spring season in Monaco, toured in Spain, gave a season in London and two in Paris. This company had a number of star dancers but its creations were, without exception, disappointing and added nothing to the art. The most interesting performances were those given by Tamara Toumanova in Giselle, by Rosella Hightower in The Black Swan and by André Eglevsky in David Lichine’s ballet The Enchanted Mill. This company also showed a high level of male dancing. Léonide Massine
appearing as guest artist with George Skibine and André Eglevsky in his revivals of *Le Beau Danube*, *Le Tricorne* and *The Good Humoured Ladies*. The Salvador Dalí surrealist ballet *Tristan Fou* with choreography by Massine and music arranged from Wagner's opera fell distinctly flat save in Spain where it had some success. It was felt that such shock tactics were dated, that the striking scenery dwarfed the action and that the maltreatment of Wagner's score was in no sense justified.

The International ballet continued to cater to the insatiable English provincial demand with its ever popular versions of the classical ballets.

Apart from ballet London, Paris and other European capitals saw much work of high quality. Katherine Dunham and her Caribbean-inspired dancers continued their well deserved success. Dunham had succeeded in finding a technique, half ballet dancing and half folk dancing, that suited the coloured physique and temperament and that had its basis in discipline rather than in improvisation. Mrinalini Sarabhai brought the Indian dance to Europe in its purest and most classical form. Her choreographic adaptations of this technique in *Man and Buddha’s Disciple* showed the Indian dance with integrity and yet in a form that Europe could appreciate. Ram Gopal, essentially a virtuoso performer, toured the Scandinavian countries and Holland with great success. Théophile Gautier once wrote that the Spanish dance was a Parisian invention. Certainly during 1949 Paris had almost a surfeit of the Spanish form with Antonia and Rosario who were applauded both by the public and by the critics, José Gréco with his company and the more classical Mariemma, Argentina’s hearess, who also gave a season in London. Mariemma’s style emphasized the sharp division between Flamenco (gipsy) dancing and true Spanish dancing; she gained high praise for the exceptionally disciplined and musical nature of her art. Emersonala, a young Flamenco dancer from Spanish Morocco, made her English début and created an impression through her vitality and striking physical beauty.

Apart from this quantity of dancing events of which few were of high quality, the important feature of 1949 was the marked tendency, especially evident in Great Britain, to bring ballet to the masses. This manifested itself in two directions, through performances in vast sports arenas and through the medium of television. There were four sets of arena performances in London, three at the Empire hall, Earls Court, and one at Harringay arena. All met with great popular success. These galas or festivals as they were described were inaugurated by Alicia Markova and Anton Dolin with a corps de ballet assembled for the occasion. This first series of five performances was a greatly magnified dance recital in which Markova excelled herself by the quality of her dancing in spite of the incongruous surroundings and the fact that the conductor was forced to turn his back on the dancers. For the second set of performances the promoter engaged Danilova, Massine, Frederick Franklin and the Metropolitan company and presented orthodox ballets such as *Les Sylphides*, *Le Beau Danube* and *Prince Igor*. These were completely lost in their mock rustic surroundings that included a lake separating orchestra and stage. For the Harringay performances of Markova, Dolin and the Ballet Rambert the stadium was partially transformed into a theatre with a certain gain in perspective. The last of these performances, three Nijinsky galas at the Empress hall presented a record number of stars, Toumanova, Chauviré, Marjorie Tallchief, Massine, Jean Babilé, Skibine and Skourakoff together with the Rambert company. Such stadium ballet had clearly come to stay but it was already evident that the type of ballet designed for the stage and an audience of some 1,500 was not artistically suitable for performance in a stadium accommodating 8,000 to 10,000 people. Stadium ballet would only succeed if it was conceived in terms of the locale which would mean the birth of a new type of choreography.

British television produced four ambitious programmes entitled *Grand Ballet*, showing the Paris Opera company twice, the Ballets des Champs Elysées and the Ballets de Paris. In view of the technical difficulties involved these performances had great quality. But here again a problem arose over the inevitable tug between what was good ballet and good television and once again, as with stadium ballet, the answer seemed to lie in a new type of choreography that would combine the media. It was certain that 1949 fore-shadowed as intimate a connection between ballet and television as between broadcasting and the orchestra. Since there was too little talent for the multiplication of companies television might well be the only manner in which the demand could be fulfilled.

(A. L. H.L.)

**United States.** The Sadlers’ Wells ballet of London made its American début, enjoying a success which stimulated interest in the ballet throughout the country. The company opened at the Metropolitan opera house on Oct. 9 in a full-length version of Tchaikovsky’s *Sleeping Beauty*, with Margot Fonteyn in the title role. Later productions included a complete *Swan Lake* and ballets choreographed by Ninette de Valois, Frederick Ashton and Robert Helpmann. Leading dancers were Fonteyn, Ashton, Helmpam, Moira Shearer, Beryl Grey, Pamela May, Violetta Elvin and Harold Turner.

The New York city ballet, directed by Lincoln Kirstein, named Jerome Robbins as associate artistic director to George Balanchine. It produced Robbins’ ballet *Guests*, with music by Marc Blitzstein. Balanchine choreographed a brilliant new version of Igor Stravinsky’s *Firebird*, with Maria Tallchief in the title role, and décor by Marc Chagall. Other new productions were *Bourrée Fantasque* choreographed by Balanchine and music by Emanuel Chabrier; William Dollar’s direction of *Onidne*, (Antonio Vivaldi’s music with décor by Horace Armistead).

Ballet Theatre was re-organized after a period of inactivity which had lasted since the spring of 1948. Directed by Lucia Chase and Oliver Smith, with the collaboration of Antony Tudor, it opened in New York on April 17. Principal dancers were Nora Kaye, who danced her first *Giselle*, Igor Youskievitch, Hugh Laing, Janet Reed, Paul Godkin, Diana Adams, and Bambi Linn, with Nana Golnier, Maria Tallchief and Jerome Robbins as guest artists. *La Fille Mal Gardée* was revived. During the summer Ballet theatre appeared at Jacob’s Pillow, Lee, Massachusetts.

The Ballet Russe de Monte Carlo toured extensively, and had spring and autumn seasons in New York. Ruth Page’s *Love Song* with Schubert’s music was presented on March 1, and there was a revival of Michel Fokine’s *Carnaval*. New autumn productions included a one-act version of *Paquita* by Alexandra Danilova, with music by Deldevz, *Birthday*, choreographed by Tatiana Chanie to music by Gioachino Rossini, and revivals of *The Mute Wife*, *Igrushki*, and *Graduation Ball*.

The New York City Dance theatre was organized under the auspices of the City Centre of Music and Drama, and held its first season of modern dance in December. The dancers included Charles Weidman, José Limón, Valerie Bettis, Pauline Koner, Nina Fomaroff and Letitia Iide.

Summer dance festivals were held at Jacob’s Pillow and at Connecticut college, New London. Jacob’s Pillow saw the premières of Ted Shawn’s *The Dreams of Jacob*; Ruth Page’s *Harlequinade* and Bentley Stone’s *Reunion*.

A complete production of Tchaikovsky’s *Nutcracker*, choreographed by William Christensen, was presented by the San Francisco ballet, which also gave his *Parranda*, with a score by Morton Gould, and Lew Christensen’s
**Vivaldi Concerto.** The Pacific Dance theatre presented new ballets by Serge Temoff and Walton Biggerstaff. (L. MRE.)

**Ballroom Dancing.** During 1949 there were two marked, completely different influences in ballroom dancing. One widespread interest was in square dancing and the other in Cuban rumba. Designers promoted square dance fashions; the dance was seen on television, in newsreels and magazines. The Rumba had become second in popularity to the fox trot. The mambo, with its new syncopated rhythm, was the most popular rumba with expert dancers.

There was a decreased interest in jitterbug, and the tango was danced only in cosmopolitan centres. The samba grew in popularity, as was evidenced by the great number of new compositions. The waltz gained in popularity from the appearance of new song hits. (A. Mu.)

**DAVIES, CLEMENT,** British politician (b. Feb. 19, 1884), was educated at Llanfyllin, Montgomeryshire, and at Trinity Hall, Cambridge. He was a law lecturer at the University College of Wales, Aberystwyth, 1908-9, when he was called to the bar. From 1919 to 1925 he was a junior counsel to the treasury and in 1926 was made a K.C. He was elected to the House of Commons as Liberal member for Montgomeryshire in 1929 and was re-elected in 1931, 1935, and 1945. The election of 1945 left the Liberal party in the House of Commons without a leader owing to the defeat of Sir Archibald Sinclair at Caithness and Sutherland, and Clement Davies was elected to lead the parliamentary party. His active leadership gave purpose to the small group of Liberals in the House of Commons. On Feb. 12, 1949, he broadcast on behalf of the Liberal party in the series of political broadcasts. In Sept. 1949 he led the British delegation to the Inter-Parliamentary union conference at Stockholm.

**DEATH STATISTICS:** see Vital Statistics.

**DECORATIONS AND MEDALS.** In Nov. 1949 the King approved the award of the Naval General Service Medal, first established in 1915 to recognize minor naval operations of sufficient importance to justify the award of a medal, with a clasp bearing the inscription "Yangtze 1949." The award would be granted to all on board H.M. Ships "Amethyst" and "Consort" on April 20, 1949, when those ships were first attacked by the Chinese, to those in H.M. Ships "London" and "Black Swan" which attempted a rescue on April 21; and to those in the Royal Air Force Sunderland aircraft which flew to the "Amethyst" on April 21 and 22. The grant to the "Amethyst" covered the period up till July 31, 1949, the date she escaped from the Yangtze and regained the open sea. Army personnel carried in the "Amethyst" were also eligible for the decoration.

The award of the Naval General Service Medal and the General Service Medal (Army and Royal Air Force), with an appropriate clasp for service in Palestine after World War II, was announced in Nov. 1947. In July 1949 details were published of those eligible for the decoration. The clasp would be inscribed "Palestine 1945-48," and would be given for service from Sept. 27, 1945, to June 30, 1948. The decoration would be granted not only to certain persons in the Royal navy and the army, but also to members of the merchant navy and to civilians.

**Bulgaria.** Shortly after the death on July 2 of Gheorghi Dimitrov, prime minister of Bulgaria from 1946, the Bulgarian government announced the creation of the Order of Dimitrov. It would be the highest order Bulgaria could confer.

**India.** Details were made available of the military decorations of the Union of India. The highest decoration for gallantry, Parun Vir Chakra, would rank second only to the Victoria Cross and would be awarded for the highest form of bravery in the presence of the enemy. It would be a replica of Asoka's wheel made of brown gun-steel with a ribbon of plain saffron.

The second and third awards, Mahavir Chakra and Vir Chakra, would rank next to the Distinguished Service Order and the Military Cross. Mahavir Chakra would be a five-pointed heraldic star with a surrounding silver ring and an enamelled gold replica of Asoka's lions superimposed at the centre. Vir Chakra would also be a five-pointed heraldic star with a similar ring and a replica of Asoka's wheel.

**Netherlands.** A new decoration Resistance Star for East Asia, 1942-45 was created. It was to be awarded to men or women, who, by their energy, firmness or public spirit rendered particular services in Japanese or Japanese-held territory in east Asia to Netherland subjects in enemy captivity or distinguished themselves in resisting the enemy in that territory during the years 1942-45. The award could be made posthumously.

**DE GASPERI, ALCIDE,** Italian statesman (b. Pieve Tesino, Trentino, April 3, 1881). Appointed prime minister on Dec. 9, 1945, he five times reconstructed his cabinet. (For his early career see Britannica Book of the Year 1949.)

On Feb. 11, 1949, the 20th anniversary of the signing of the Lateran treaty between Italy and the papacy, he made his first official call on Pope Pius XII. On March 11 he informed the Chamber of Deputies that the cabinet was unanimous that Italy should join the North Atlantic treaty. On April 17, in a press interview, he announced the government's plan for land reform. He visited Trieste (q.v.) on June 10 and pledged the Italian government to continue to work for the return of the territory to Italy. On Aug. 29 he left for Austria where he spent a few days on a private visit.

**DEMOCRATIC PARTY, U.S.:** see Political Parties, U.S.

**DENMARK.** A constitutional monarchy of north central Europe composed of the peninsula of Jutland and 100 inhabited islands, the largest being Zealand (Sjælland) and Fyn (Funen). Denmark controls the three straits between Kattegat and the Baltic sea: the Oresund (between Sweden and Zealand), the Great Belt (between Zealand and Fyn) and the Small Belt (between Fyn and the Jutland peninsula). Area, excluding Faeroe Islands (q.v.): 16,573 sq. mi. (Peninsula of Jutland: 11,411 sq. mi.). Pop.: June (1945, census) 4,045,232, (1949 est.) 4,200,000. Chief towns (pop. 1945 census): Copenhagen (cap., 927,404); Århus (107,393); Odense (92,436); Ålborg (60,880); Esbjerg (43,241). Language: Danish, with small admixture of German. Religion: Lutheran, with small Roman Catholic and Jewish minorities. Ruler, King Frederik IX (q.v.); prime minister, Hans Hedtoft; minister of foreign affairs, Gustav Rasmussen (q.v.).

**History.** The year 1949 brought Denmark, with unexpected swiftness, into the North Atlantic treaty and saw stable conditions maintained in most fields; but anxiety for the "pro-Danish" minority in South Schleswig caused some political unrest.

The Scandinavian defence talks of 1948 were continued by the prime ministers and foreign and defence ministers of Denmark, Norway and Sweden at Karlstad, Sweden (Jan. 5-6, 1949), Copenhagen (Jan. 23-24) and Oslo (Jan. 29-30), the Scandinavian ambassadors to Britain, U.S., France and the Soviet Union attending the third meeting. Rasmussen told parliament (Feb. 9) that the government had supported the plan for a Nordic defence alliance and that the idea had not been abandoned, and the spokesman of his party (the Social Democrats) expressed unreserved support for a Nordic
pact. After attending the Labour party congress in Oslo, however, Hedtoft announced (Feb. 20) that the Norwegian Labour party’s decision in favour of the North Atlantic treaty created a new situation; and when the tentative suggestion of a Dano-Swedish alliance had been rebuffed by Sweden, the U.S. was informed that the Danish government had reviewed the country’s position in relation to the treaty. Rasmussen flew to Washington (March 9) and was there assured that Greenland (q.v.) would not be used for aggression, while Hedtoft reminded the people of the fate of isolated small nations when Hitler was expanding Germany’s Lebensraum; he complained nevertheless of “gross errors” committed by the U.S. and the western European great powers and said that the U.S.S.R. had sacrificed more than any other state in World War II. When Denmark was formally invited by the eight negotiating nations to join the North Atlantic treaty (March 16), the Lower House voted in favour by 119 votes to 23 (Radicals and Communists) and the Upper House by 64 votes to 8, a proposed plebiscite being turned down, and Rasmussen joined eleven other foreign ministers in signing the treaty in Washington (April 4). Through a note delivered in Copenhagen, the U.S.S.R. had protested in vain.

Rasmussen had already (March 14) given the State Department a list of the arms most urgently needed, which was to form the basis of a recommendation to congress, and the Danish ambassador had in turn confirmed that the North Atlantic treaty principle of self-help and mutual help was well understood, within the limits set by Denmark’s internal recovery programme; dollar costs of increased arms production must, however, be met from outside. The availability of American machine tools and materials for this purpose was under discussion by members of the M.D.A.P. (Mutual Defence Aid programme) survey team and a Danish group at the U.S. embassy in London during November. The Defence commission reported in favour of a united command for the services, with a single defence minister (June 29). The Danish forces would continue their contribution towards the occupation of the British zone of Germany for two years from May 15, 1949.

Denmark also accepted an invitation to join the Council of Europe (May 5) and was allotted four seats in the consultative assembly. In the delegation attending the first meeting, at Strasbourg (Aug.), were Ole Bjørn Kr. Krag, Conservative leader, and Thorkild Christensen, economist and former minister of finance. The Scandinavian delegations adhered rather to the British “functional” approach to the new European structure than to the continental tendency towards “constitutional” changes.

These developments had proceeded smoothly; but disquiet over South Schleswig nearly unseated the government, whose policy was widely decried as over-cautious. The last German refugees left Denmark on Feb. 15, but in South Schleswig those who had entered the territory after Sept. 1, 1939, were estimated at 350,000 as against 340,000 “natives” (Danish and German). Despite earlier Danish requests and protests, little alleviation was in sight and on Nov. 2 the Swedish and Norwegian ambassadors and the Icelandic minister in London delivered a memorandum to the Foreign Office expressing the general Scandinavian concern at this refugee concentration. On July 8 the representatives of five Danish parliamentary parties had finally agreed to a statement affirming the South Schleswigers’ “right of self-determination” and of free national, cultural and political activity, but the Liberal party recorded its regret at the failure to demand a plebiscite guaranteed in a treaty with Germany. An electoral set-back for the South Schleswig Electoral association in August (75,387 votes, compared with 91,631 in 1947) was, however, followed by the so-called Kiel declaration, approved by the Schleswig-Holstein Landdag (Sept. 26), entitling a South Schleswiger, in whatever position, to express his “Danishness” without fear of discrimination. Christopher Mayhew subsequently informed the House of Commons (Nov. 4) that it was largely due to the direct intervention of the British government and the advice which they had given to the German authorities that very considerable rights and privileges belonged to the Danish-minded minority, and he declared that the Danish government were not concerned with frontier rectification and did not claim a plebiscite.

By a new agreement (May 27), 75% of the whole Danish butter export, up to a maximum of 115,000 tons, would be bought by Britain until Sept. 30, 1955, and a dollar saving of Kr. 30 to 40 million would be effected by buying from Britain, for a year, heavy fuel oils hitherto purchased from the U.S. New trade talks were, however, postponed from Oct. 21 to December, because of devaluation problems, and on Nov. 4 the British ambassador was handed an aide mémoire expressing the Danish government’s concern at the rise in price of British coal, which would hamper Danish industry.

Both a congressional committee and W. A. Harriman expressed approval (April) of Denmark’s progress under the European Recovery programme, although details of Denmark’s long-term plans were criticized (May 3). Of Kr. 528 million credits, by May 1949 the country had used only Kr. 250 million for imported goods. But though the inflation danger was said by the director of the National bank to have passed, the minister of trade, Jens Krag, declared (June 4) that Denmark faced a serious financial crisis: the dollar income had almost dried up, the sterling debt had increased and unemployment among skilled workers was growing. On Oct. 20 the government won a vote of confidence on its economic policy (64 to 35, with 39 abstentions), which included the decision to devalue the krone with the pound sterling, but opinions remained much divided on the right course to pursue. Seeking a regional currency and trade agreement of the type recommended by the Organization for European Economic Co-operation (q.v.), Great Britain approached Denmark, Norway and Sweden; but the first
talks (Dec. 15-17) revealed chiefly the difficulties in the way of early action. Textile rationing was abolished, except for cotton goods, on April 5, and nearly ten years of meat rationing ended Nov. 21, meat prices simultaneously rising 50%. A wage increase of Kr. 15 monthly, with a larger holiday bonus, was agreed between the seamen’s representatives and the shipping companies (April 1). The cost of living index in October was 179 (1935 = 100), the same as a year before.

Four hundred persons condemned to less than 10 years’ imprisonment for collaboration with the Germans were amnestied on June 5, the centenary of the Danish constitution; altogether 20,661 had been tried for treason, collaboration of war profiteering since 1945, and about Kr. 120 million had been paid in compensation or fines.

Education. (1946-47) Schools (elementary 4,163, pupils 481,395, teachers 18,517; middle and secondary, pupils 73,437, technical 362 pupils 50,722; two universities and six institutions of higher education, with 13,166 students and 416 professors and lecturers. A illiteracy.

Agriculture. Main crops ('000 metric tons, 1948; 1949 est. in brackets): wheat 254 (295); barley 1,459 (1,565); oats 988 (945), rye 400 (437); cattle, July 16, 1949, 2,962,900; sheep 67,000; horses 528,000, poultry 25,199,000; Oct. 8, 1949 pigs 3,029,000 (only 154,000 less than prewar). Supplies of butter for export were 33% larger than in 1948, and egg production was up 19% for animals milked production showed a marked increase.

Sept. 1949 (1935 = 100) Fisheries (1948) total catch 215,053 metric tons valued at Kr. 179 8 million.

Industry. Industrial establishments (1948) 109,288; persons employed 641,379. Fuel and power: coal, imported ('000 metric tons, 1948; 1949, six months, in brackets) 2,728 3 (1,607) 0; gas produced ('000 cubic m., 1947-48) 306,000; electricity (1947) 1,068 million kWh; crude oil, imported (metric tons 1948; 1949 in brackets) 19 6 (20 1) M. oil, imported (metric tons, 1948; 1949 in brackets) 9 1 (3 1) M. diesel fuel, imported (metric tons, 1948; 1949 in brackets) 6,183 7; iron and metal working 1,052 1; chemicals 786 6; textiles 739 9; clothing and footwear 623 4, cement, porcelain, glass, tiles 339 2; wood-working 220 1.

Foreign Trade. (Mil. kroner, 1948; 1949, six months, in brackets) Imports 3,418 6 (2,159 3); exports 2,730 5 (1,609 9).

Bibliography. Monica Redlich, Denmark: Places and People (Copenhagen, 1948); Orla Jensen, Social Services in Denmark (Copenhagen, 1948).

DENTISTRY. During 1949 the demand for dental treatment under the British national health service continued on the same unexpectedly high level as obtained during 1948 and dentists were subjected to heavy and continuous strain. The demand for treatment, irrespective of the time when treatment was begun. Where similar cases, treated symptomatically, were available for comparison, a considerable reduction of the period of acute symptoms, fever and rash and a decided shortening of the convalescent period were noted in the aureomycin-treated cases. There were no complications and no deaths in these cases.

Clinical improvements in symptoms of the acute illness usually occurred within 24 hr. after oral therapy with aureomycin had been started. The temperature returned to normal, either during or before the third day of treatment, and the rash in the cases of typhus or spotted fever usually faded at about this time.

Experience with the use of aureomycin in the treatment of lymphogranuloma venereum showed that it had a definite position the minister of health, without consulting the profession, reduced the scale of fees by approximately 20%. This action and a gradual tightening of the control over the treatment given by dentists caused widespread dissatisfaction in the profession. On the other hand, the removal of economic barriers enabled a large number of persons to receive dental treatment of which they were in need but for which they could not pay. Nevertheless the dental services provided by local education authorities for school children were drastically curtailed because dental officers under these authorities considered they had not been offered adequate salaries and many resigned to enter private practice.

On the scientific side the year was marked by an increasing interest in research directed towards the discovery of the causes of dental caries and a growing disposition to question the validity of some of the accepted theories. New ground was broken in a paper by H. F. Atkinson and Professor E. Matthews, "An investigation into the Organic Components of the Human Tooth: A study of Sound and Carious Dentine," British Dental Journal, vol. 86, no. 7, April 1, 1949. This carried the work of other investigators a stage further and strengthened the belief that a breakdown of the organic components of the enamel constituted the major type of caries.

The annual meeting of the British Dental association heard a paper by Gilbert J. Parfitt, "Topical Application of Solutions of Fluorides to the Teeth," British Dental Journal, vol. 87, no. 3, Aug. 5, 1949. The author reviewed the work that had been carried out in America and elsewhere on the effect of painting the teeth of children with solutions of fluorides. H. H. Stones, F. E. Lawton, E. R. Bransby and H. O. Hartley in "The Effect of Topical Applications of Potassium Fluoride and of the Ingestion of Tablets containing Sodium Fluoride on the Incidence of Dental Caries," British Dental Journal, vol. 86, no. 11, June 3, 1949, reported that they were unable to confirm the results obtained in America. However, later in the year a working party was appointed to organize a large scale investigation into the possibilities of preventing dental caries in children by this method. Ample material was available in the school dental service of Great Britain for such an investigation and, although the results cannot be available for publication, its inauguration constituted one of the major advances achieved in the year. (B. J. W.)

DERMATOLOGY. Aureomycin continued to exhibit remarkable versatility as an antibiotic. Research showed that it exerted bacteriostatic or bactericidal activity against a wide range of both gram-negative and gram-positive bacteria, including penicillin-resistant and streptomycin-resistant organisms. It proved highly effective against most strains of Rickettsia, as well as viruses of psittacosis and lymphogranuloma venereum.

In most of the cases of rickettsial infections that were reported, the outstanding feature was the uniformity with which the fever and symptoms subsided in relation to the treatment, irrespective of the time when treatment was begun. Where similar cases, treated symptomatically, were available for comparison, a considerable reduction of the period of acute symptoms, fever and rash and a decided shortening of the convalescent period were noted in the aureomycin-treated cases. There were no complications and no deaths in these cases.
effect in the acute cases and some benefit, particularly as an adjunct to surgical and other measures, in the management of chronic cases. Some of the chronic cases relapsed after cessation of treatment.

A number of cases of pyoderma of various types, some in newborn infants and in patients with other severe systemic diseases, showed improvement in varying degrees and for varying periods under treatment with aureomycin, after failure to obtain benefit from penicillin and streptomycin. Many of the lesions yielded penicillin and streptomycin-resistant staphylococci. In some cases of herpes zoster in which treatment was undertaken early the lesions failed to progress, the pain subsided, new lesions failed to appear and old lesions began to dry up and healed promptly after treatment with oral aureomycin was instituted. This antibiotic drug proved particularly useful in cases with aphthalmic distribution of the lesions. Relapses in herpes zoster occurred with new lesions reappearing, after treatment was discontinued prematurely, but aureomycin was again given with good results in some of these cases.

One hundred unselected patients with scabies were treated with a new preparation of the gamma isomer of hexachlorocyclohexane in a vanishing cream base, with which A. B. Cannon and M. E. McRae had obtained 100% cures. Complete relief from pruritis within 24 to 48 hr. was reported by about half the patients and many observed that itching ceased within two to three hours. Pronounced clinical improvement was seen in all cases after one application. Sixty-one, or nearly two-thirds of those under observation, showed no signs of activity after a single treatment. Thirty-six were given two treatments and three patients received three. All were cured and in no case could the acarus be demonstrated after the first application of the cream. This remedy was found to be effective in cases in which other preparations had failed. No cases of irritation or sensitivity occurred, either as primary or late manifestations, and there were no contra-indications even in the presence of severe secondary dermatitis. This preparation was also successful in the treatment of all types of pediculosis.

Increased use of beryllium in industry brought to light several new pathologic reactions among workers handling it; and beryllium was added to the ever expanding group of serious industrial intoxicants. In the beryllium refining industry, cases of acute dermatitis occurred from contact with the soluble salts. Crystals imbedded under the skin produced foreign body reactions with ulceration. Extensively proliferating granulomas necessitating wide excisions developed following cuts from glass fragments in which particles of beryllium phosphor remained. (See INDUSTRIAL HEALTH.)

Bacitracin, another antibiotic drug, was used with success in some superficial pyogenic diseases of the skin. J. L. Miller, M. H. Slatkin and B. A. Johnson found it effective in impetigo contagiosa, folliculitis, infectious eczematoid dermatitis, ecthyma and dermatitis repens, but of only limited value in syphilis vulgaris. Their results were best with bacitracin in a concentration of 500 units per gram and an oil and water or greaseless carbowax base.

Excellent results were reported by W. E. Wooldridge and H. L. Joseph in the treatment of circumscribed and disseminated neurodermatitis and other itching dermatoses by the local application of phenindamine (thephorin) ointment. In the cases that responded to this drug, improvement in the eruption was noted in a week and once improvement became evident, it was progressive and usually reached a peak within four weeks. Even though no more improvement occurred in most patients after that time, they could be maintained in an improved condition.

Since the advent of streptomycin and its proved effectiveness in the treatment of granuloma inguinale, many trial dosage schedules had been used to attempt to standardize a regimen of therapy. M. H. Samitz, P. N. Horvath, P. P. Mari and H. Berman reported 19 cases of chronic granuloma inguinale treated with a uniform total dosage of 20 grams of streptomycin administered in fractions of 0.5 grams every three hours for five days. All patients responded rapidly and there were no recurrences during an observation period of 6 to 15 months.

(H. Fx.)

DIABETES. The first international conference of Diabetes associations was held in Brussels, June 9, 1949, under the leadership of Professor J. P. Hoet of Louvain, Belgium. Papers were read upon heredity, social relationships, the diabetes detection drive in the United States, life insurance and the employment of diabetics in government and private agencies. Representatives were present from 12 or more countries. The American Diabetes association expanded its efforts during 1949, concentrating upon a diabetes detection drive for the second year. The drive attracted much attention in the press, radio and from medical bodies; industrial organizations participated more freely than in the past. There were now 20 affiliated societies of the American Diabetes association in the U.S. and Canada. Many of these had two sections, one for physicians and the other for the lay public. The diabetes branch of the United States Public Health service conducted large scale demonstration activities in co-operation with local medical societies and health departments in Brookline, Massachusetts, Jacksonville, Florida, and it began similar surveys in Milwaukee, Wisconsin, and Dallas, Texas. The Oxford, Massachusetts, and Jacksonville surveys were not entirely comparable but for new cases were not significantly different, being 1% and 0-9% respectively. To facilitate the detection of probable diabetics, the Wilkerson Heftmann blood sugar five minute screening test was devised; with this and the Hewson clinitron, more than 100 blood sugar tests could be performed hourly.

The number of diabetes homes and camps for children continued to grow. In the summer of 1949 there were at least 11 such camps in the U.S. and Canada. In England many diabetic children with unsatisfactory home surroundings were placed in various publicly and privately supported homes for complete treatment and education. The Clara Barton Birthplace camp in North Oxford, Massachusetts, was extended to include older girls.

The steadily increasing duration of life of diabetics was shown in a compilation of fatal cases by the George F. Baker clinic. Beginning about 1900 steady progress was noted in each age group of patients. Those who developed the disease between 10 and 19 years of age had the shortest duration of life, if one allowed for a normal reduction of expectancy due to age; adolescents were the most difficult to control. The percentage of fatal cases surviving 20 years of diabetes in 1949 was 24:1% for all diabetics in contrast to 1:8% between 1897 and 1914. A hopeful sign was the fall in morbidity and mortality of diabetic coma, once the scourge of the diabetic. It reached its lowest level, 1.9% among 2,299 cases discharged from one clinic. No deaths occurred in 92 successive coma cases in one hospital, none for two and a half years in another large hospital and only one in two years among cases in a third institution.

A pessimistic view of the diabetic child's expectation of life was taken by G. Fanconl of Zürich, Switzerland, reporting 136 cases in which none of the 87 traced lived more than 21 years. This was in contrast to the experience of the George F. Baker clinic, in which 24% of 2,145 living patients who developed diabetes at under 15 years of age had already reached 25 years of age while 12% had survived the disease 25 years and smaller groups 30 and even 35 years.
The importance of duration of the diabetes in the development of arteriosclerosis became evident in Howard F. Root’s study of 202 diabetics with onset between the ages of 15 and 30, although it was shown that control of the disease was also a major factor. High blood pressure rose from 2% to 33%, calcified arteries from 21% to 88%, retinits from 4% to 60%, and proteinuria from 3% to 10%, as the average length of the disease advanced from the first to the third 10-year period.

Continued research emphasized the experimental work dealing with adrenocorticotropic hormone (ACTH) and its diabetogenic action as well as the protective action of glutathione even in humans. Jerome W. Conn found in his experimental subjects (temporarily diabetic by injections of adrenocorticotropic hormone) that the hyperglycemia fell to normal by intravenous injections of glutathione. Moreover, in a patient with Cushing’s syndrome with pituitary diabetes of long standing, the intravenous injection of glutathione brought about an immediate, if brief, fall to normal of the blood sugar. A hint of the connection of carbo-hydrate and purin metabolism was evidenced in patients with gout by the production of typical attacks by an injection of ACTH. Other observations pointed to the close relation of carbo-hydrate and protein in the promotion of synthesis of muscle protein from amino acids in the blood. (See also Endocrinology.)

DIAMONDS. The trend of diamond sales since the beginning of 1944 is given in Table I.

| TABLE I.—DIAMOND SALES, 1944—Sept. 1949 | 
|---|---|---|---|---|---|
| | 1944 | 1945 | 1946 | 1947 | 1948 | 1949 |
| Gem | 31.2 | 21.0 | 26.1 | 20.1 | 26.8 | 19.9 |
| Industrial | 3.8 | 3.5 | 3.5 | 4.4 | 11.3 | 8.5 |
| Total | 34.8 | 24.5 | 29.6 | 24.5 | 38.1 | 28.4 |

The unprecedented figure of £38,100,000 for 1948 was chiefly accounted for by the United States taking 80% of the world’s production of industrial diamonds, partly for stockpiling purposes; the weight of industrial stones exceeded that of gem diamonds, although the value was lower.

| TABLE II.—U.S. DIAMOND IMPORTS, 1948* | 
|---|---|---|---|---|
| | carats | value | 
| Uncut gems | 912,762 | $44,460,365 |
| Cut gems | 389,314 | $36,772,070 |
| Industrial | 10,418,058 | $32,184,225 |
| **Total** | 11,720,134 | $132,889,524 |

* Source: National Jeweler, Chicago.

U.S. diamonds imports in 1948 (Table II) compared with 5,458,292 carats for a total value of $109,689,729 in 1947. The devaluation of the pound sterling had the effect of raising the prices of diamonds.

The Dutoitspan mine, in South Africa, which produces a large number of Cape (or yellow) diamonds and the Jagersfontein mine were re-opened in Dec. 1949. A large diamond, weighing 211.5 carats, which was discovered in South Africa in 1945 and therefore named “The Victory,” was on display at the Diamond exhibition in Amsterdam during June and July 1949. One of the most famous and legendary diamonds in history, the “Hope” blue, which for many years was in the possession of the late Mrs. Walsh McLean, was sold at the beginning of 1949 to a New York diamond merchant. (See also GEMS; MINERAL AND METAL PRODUCTION AND PRICES.)

Dietetics: see Food Research.

DIOΜIDIS, ΑLEXΑΝΔΡΟΣ, Greek economist and statesman (b. Athens, 1875), was a friend of Eleftherios Venizelos whose Liberal government he joined as minister of finance (1912-14). After World War I he retired from politics and in 1923 was elected governor of the National bank, at that time still the bank of issue. In this capacity he negotiated the refugee loan of 1924 and the stabilization and public works loan of 1928, besides conducting negotiations which led to the creation of the Bank of Greece as the bank of issue (1928). Retiring from public life in 1930 he studied the economics of the Byzantine empire and in 1943 published a two-volume work on the land policy of the Macedonian and Cnemene emperors. Before World War II he was honorary president of the Supreme Economic council and from 1945 president of the Supreme Reconstruction board, and chairman of the board of the National bank. On Jan. 20, 1949, he joined the coalition government of Themistocles Sofoulis as a non-party deputy premier; and after Sofoulis’s death (see OBITUARIES) he succeeded him on June 30 as prime minister of a Populist-Liberal coalition cabinet. He resigned on Jan. 5, 1950.

Disasters. During 1949 loss of life and property occurred in the following disasters:

**Aviation**

Jan. 16 Between Bermuda and Jamaica. A British four-engine transport plane, flying from London to Santiago, Chile, was lost at sea, and 13 passengers and a crew of 7 were presumed dead.

Jan. 27 Near the Canary Islands. A U.S. B-29 bomber disappeared while flying from Dakar, French West Africa, to Marham, Norfolk, and the crew of 15 were given up for lost.

Feb 8 Oresund, off the Swedish coast. Twenty-eight persons aboard a Scandinavian air liner lost their lives when their plane crashed into the water.

Feb. 19 Exhall, Warwickshire. Fourteen persons were killed when a London-Glasgow British European Airways plane collided in mid-air with a Royal Air Force training plane.

Feb. 24 Cuzco, Peru. Twenty-two persons died when a Peruvian air force transport plane crashed on take-off.

May 4 Turin, Italy. Thirty-one persons, including 18 members of Turin’s championship football team, died when an Italian air liner crashed into the courtyard of the Superga cathedral.

May 6 Off Portland Bill, Dorset. All 7 occupants of a two-engined freighter aeroplane died when it crashed on a test flight.

June 7 Near San Juan, Puerto Rico. Five persons lost their lives when a twin-engined transport plane carrying 81 persons, crashed in Caribbean waters.

June 23 Off Barri. A K L M Constellation plane, bound for Amsterdam from Batavia, broke in mid-air and crashed in flames. All 33 occupants were killed.

July 12 Near Bombay, India. Forty-five persons, including 13 well-known U.S. journalists, were killed when a Dutch transport plane crashed.

Aug. 14 Between Ankara and Izmir, Turkey. Seven British, including the air attaché at Ankara, and Turkish air force personnel were killed when their transport crashed.

* Estimated.

Total (world) | 11,774 | 14,384 | 10,127 | 9,754 | 10,659

The table includes the production of diamonds of all kinds, regardless of carat weight, in the world for the years 1944-47, with the exception of the U.S.S.R., whose production is not included.
Aug. 19 Greenfield, near Oldham, Lancs. Twenty-four persons died when a British air liner approaching Manchester from Belfast crashed into a peak in the Pennines.

Aug. 21 Northern Manitoba, Canada. A twin-engined plane crashed about midway between Churchill and Winnipeg, killing the 21 persons on board, including 8 Eskimos.

Sept. 9 Near St. Josephin, Quebec. Twenty-three persons aboard a Quebec Airways plane were killed when the aircraft crashed and caught fire on a mountainside. It was later reported that explosives had been placed on board the plane, and a Quebec woman and a man, whose wife was on the plane, were held.

Sept. 17 London. Nine aircrash of various British planes died in the annual commemoration of the Battle of Britain.

Oct. 28 The Azores. An Air France Constellation plane, flying from Paris to New York, crashed in flames into a mountain, killing all the 48 people on board, who included Ginette Neveu the violinist and Marcel Cerdan the boxer.

Nov. 1 Washington, D.C. The worst civil aviation disaster in U.S. history occurred when 55 men, women and children died in an Eastern Airlines Douglas plane which was rammed by a P-38 fighter plane.

Nov. 16 Stockton, California. Two B-29 planes on a mass training flight collided at 27,000 ft. 18 of the crew of 21 were killed.

Nov. 20 Near Oslo, Norway. Thirty-four persons were killed, among them 27 children, mostly orphans travelling from Tunisia to a rehabilitation centre in Norway, when their plane crashed.

Dec. 1 Near Jacarézinho, Brazil. Seventeen passengers and four crew members died when a Brazilian transport plane crashed into an isolated mountainside.

Fires and Explosions

Jan. 12 A fire broke out in a home for children at Château d'Oex, Switzerland. Eleven Swiss children and two nurses died.

Feb. 12 Moravská Ostrava, Czechoslovakia. Nineteen miners were reported missing and nine others were injured when methane gas in a coal mine caught fire.

Feb. 17 Near Bautzen, Saxony, Soviet zone of Germany. Reports circulated that 41 persons were killed in the explosion of a gunpowder factory.

Feb. 27 Gambier, Ohio. Nine students died in a fire that destroyed a dormitory at Kenyon college and 24 others were injured.

Mar. 3 Muskegon, Michigan. A mother and nine children, from 4 to 21 years old, died when fire destroyed their cottage.

Mar. 11 Brunswick, Germany. An explosion in a dump in the British Near of Germany killed 13 workers and injured 68.

Mar. 30 Nadjahi, Japan. Fifty-seven Japanese were killed and 16 injured when a mine drifted ashore and exploded.

April 5 Effingham, Illinois. Sixty-six persons, including 13 infants, were killed when fire blazed swiftly through St. Anthony's hospital, in the second most tragic fire in U.S. history.

May 4 Glasgow, Scotland. Thirteen salesgirls were trapped and died and 24 persons were injured in a clothing store fire.

May 12 Eleven Russians and eight Germans were killed when a train carrying condemned ammunition exploded near Magdeburg in the Soviet zone of Germany. Sabotage was suspected.

July 16 Prüm, Germany. At least 14 persons were killed, 10 were missing, 77 were injured and 700 made homeless after a cache of dynamite exploded.

July 21 Canton, China. One hundred and twenty persons were reported killed or injured in the explosion of a Nationalist ammunition dump.

July 26 Tarancon, Spain. At least 33 persons were killed and 105 were injured in the explosion of a military arsenal.

Aug. 20-22 Gironde département, France. More than 80 persons died in fires that burned about 125,000 ac. of woodland in the départements.

Sept. 2-3 Chungking, China. At least 1,700 persons were killed, 100,000 were left homeless and more than 10,000 buildings were destroyed or seriously damaged in an 18-hr. fire.

Nov. 6 Near Zwickau, Germany. An explosion in a Soviet zone uranium mine killed 170 German miners, according to a report published on that date by the western zone newspaper "Sozialdemokrat.

Marine

Jan. 3 Near Lorient, Brittany, France. Eleven sailors were drowned during storms accompanied by heavy gales, when the French tender "Robert-Marie" sank.

Jan. 28 Southeast of Shanghai. More than 600 Chinese were missing and presumed dead after a collier and a freighter and passenger liner, carrying war refugees, collided and sank.

April 18 Guayaquil, Ecuador. Most of the 89 passengers were drowned or burnt when the ship "Farahon" caught fire and sank.

April 25 Coast of Brazil. The Royal Mail liner "Magdalena," 17,500 tons, ran aground near Tijoura Islands 20 mi. south of Rio de Janeiro. All the passengers were saved, but the ship, which was insured for £3 million including cargo, proved a total loss.

June 21 English channel, near Dunkirk. Five seamen were killed when the Ostend-Dover steamer "Prinses Astrid" struck a mine. All the passengers were safely rescued.

July 26 Near Indore, India. One hundred and forty Hindus returning from a pilgrimage were drowned when a ferryboat capsized in the Nerbada river.

Aug. 26 Arctic waters near Norway. Eight persons perished when the U.S. submarine "Cochnio" exploded, was set on fire and sank; while 77 of the submarine's personnel were saved. An officer and five ratings from the sister craft "Tusk" were swept overboard and lost during rescue operations.

Sept. 17 Toronto, Canada. A total of 120 persons lost their lives when fire destroyed the Great Lakes passenger steamer "Noronic" at its berth.

Sept. 22 Magellan straits. Seventy-seven Argentine navy officers and men perished aboard the minesweeper "Fourrier" when the ship struck a submerged rock and sank.

Oct. 18 Off Berwick, Scotland. Twenty British seamen perished aboard the freighter "Maystone" when it sank during a gale after colliding with the unfinished aircraft carrier "Albion," an 18,300-ton ship.

Dec. 5 Off Korea. A typhoon that swept the east coast of Korea dispersed a vast fishing fleet and drowned the crews of more than 130 boats, totalling several thousand men.

Dec. 13 Off the coast of Spanish Morocco. Sixty-four fishermen were drowned in the sinking of three fishing boats during a storm.

Miscellaneous

Jan. 4 Glasgow. Altogether nine people died as the result of drinking methyl alcohol at two parties. Sixteen more recovered after receiving hospital treatment.

Feb. 12 Quito, Ecuador. Twenty persons were killed and many more were injured when crowds, angered by the disclosure that a radio dramatization of the H. G. Wells novel "War of the Worlds" was fictional and not a real invasion, rioted and burned the building housing the radio station.
DISASTERS

Sept. 6 Camden, New Jersey. A war veteran with a passion for collecting weapons shot and killed 13 persons before running out of ammunition.

Sept. 16 Southern Korea. It was announced that at least 95 prisoners who participated in a mass gaol break were killed, and at least 5 guards, 430 convicts escaped.

Oct. 29 Near Lucknow, India. Packs of hyenas killed and ate 97 children in villages during the preceding months.

Dec. 1 Burma. Clashes between government and rebel forces were estimated to have resulted in the deaths of 360 persons.

Dec. 15 Sulu province, Philippines republic. Mohammad Moro rebels ambushed a constabulary combat unit and killed 71 officers and men.

Natural

Jan. 3 Louisiana and Arkansas. Fifty-nine persons were killed and more than 250 were injured when tornadoes lashed a dozen communities.

Feb. 11 Libya. Ninety-five people died of cold and many were missing after violent sandstorms in the northwest deserts of Libya.

Feb. 20 Praia, Cape Verde Islands. At least 360 persons, queuing up for food, were trampled to death and 50 others were injured when a wall collapsed on them.

Mar. 1 Germany. At least 30 persons died as the result of gales that struck Germany, near Essen and Dusseldorf, for 24 hr.

Apr. 20 Central Chile. Fifty-seven persons were killed and 89 injured when an earthquake, causing heavy damage, shook several cities.

April 30 May, 1 Oklahoma, Kansas, Texas and Louisiana. A succession of tornadoes, including 16 in Oklahoma alone, caused 9 deaths and injuries to 85 persons.

May 20 Maceio and vicinity, Brazil. More than 100 persons died and more than 200 were injured by a 200 hr. torrential rain.

July 14-17 Yangtze and Yellow river valleys, China. The worst floods in half a century were reported to have made 20 million people homeless. In Hunan province alone, 57,000 persons were reported drowned, and 5 million acres of rice were destroyed.

July 23 Okinawa. Thirty-eight persons died and 252 were injured, while 40,000 buildings were damaged or destroyed when a typhoon struck this U.S. naval base.

Aug. 5 Central Ecuador. An earthquake that virtually demolished four towns and laid waste sections of many others killed more than 8,000 persons and left an estimated 100,000 homeless.

Aug. 16-17 Prague, Czechoslovakia. Two days of rain caused floods that took at least 16 lives and did extensive property damage.

Aug. 18 Erzurum, Anatolia, Turkey. Forty-five villages, including 1,565 houses, were destroyed, 437 were killed and 355 gravely injured as the result of an earthquake.

Aug. 31 New South Wales, Australia. Seven persons died, thousands were left homeless and much property was damaged as the result of a flood.

Sept. 1 Japan. One hundred and twenty-three persons died, 51 were missing, 419 injured and approximately 150,000 left homeless as the result of a typhoon, followed by landslides and floods.

Oct. 4 Naples, Italy. Forty persons died and about 300 were missing as the result of floods that followed a storm.

Oct. 8 Oberschlem, Thuringia, Soviet zone of Germany, 100 German miners were reported killed in a flood in a mine.

Oct. 27 southeastern India. Nearly 1,000 persons killed in a cyclone that also caused the loss of many cattle and much property damage.

Oct. 31-Nov. 2 Philippines republic. The central Philippines' worst typhoon in 12 years left a total of 975 persons dead or missing and presumed dead, besides 20,000 homeless.

Nov. 28 Northwest United States and southwestern Canada. Thirty-four persons lost their lives as the result of storms that swept across a 1,000-mi. front.

Railways

Jan. 15 Yugoslavia, near Trieste. Ten persons were killed and 12 were injured when a freight train derailed.

Feb. 12 Near Tarragona, Spain. Thirty persons were killed and 40 injured when the Madrid-Barcelona express was derailed.

Feb. 18 Port d'Atelier, Haute-Saone, France; 43 persons were killed when a locomotive ran into the Nancy-Dijon express.

April 28 Near Johannesburg, Transvaal, South Africa. Three electric trains, all headed in the same direction, were involved in the Union of South Africa's worst rail disaster, resulting in the death of 74 persons and injury to more than 90 others.

July 4 Between Strasbourg and Paris, France. Five and possibly six persons died and more than 50 others were injured when heat-expanded rails derailed the Strasbourg-Paris express.

Oct. 11 Buenos Aires, Argentina. At least 25 persons were killed and 75 injured when a suburban train ran into a goods train.

Oct. 21 Nowy Dwarz, Poland. More than 200 persons were killed when the Danzig-Warsaw express left the rails on a curve.

The steamer Noronic (6,905 tons) after a fire had gutted the vessel at Toronto in Sept. 1949; 132 passengers and crew lost their lives.
DOBI—DOCKS AND HARBOURS

DISPLACED PERSONS: see Prisoners of War; Refugees.

DISTILLING: see Spirits.

DISTRICT OF COLUMBIA: see Washington, D.C.

DIVORCE: see Marriage and Divorce.

DOBI, ISTVÁN, Hungarian politician (b. Szony, Hungary, 1898). Son of an agricultural labourer, he worked as one himself and, having become interested in social movements, at the end of World War I was active as organizer of agricultural labourers. In 1935 he joined the Independent Smallholders’ party, founded five years earlier by Tibor Eckhardt, Zoltán Tildy and other leaders of the Hungarian Peasant movement. He was elected deputy to the Constituent Assembly on Nov. 4, 1945, and was minister of state in the cabinets formed by Tildy (Nov. 1945-Feb. 1946) and Ferenc Nagy (Feb. 1946-May 1947). During this later period he became pro-Communist. He succeeded Nagy as leader of the Smallholders’ party after the latter’s forced resignation from premiership but was unable to save the party from a heavy electoral defeat on Aug. 31, 1947. He was elected speaker of the new National Assembly and, on Dec. 10, 1948, on the resignation of Lajos Dínnyés, became prime minister and announced the total liquidation of capitalism among the peasantry. At the reorganization of the People’s Independence front on Feb. 1, 1949, under the chairmanship of Mátéas Rákosy (q.v.), Dobi was appointed one of the two deputy chairmen. On June 10 he was re-appointed prime minister.

DOCKS AND HARBOURS. In 1949 the first year’s working of the nationalized dock undertakings in Great Britain showed a deficit in operation of docks, harbours and wharves vested in the British Transport commission. The undertakings showed losses in all but two groups, although gross receipts were 25% above those for 1947. The total deficit for 1948 was £1,329,484. The annual report stated that notwithstanding the existing volume of traffic and increases authorized in 1947, present charges levels would not enable the commission to comply with the requirement that revenue should be sufficient to cover all properly chargeable costs. It was agreed that transfers to the commission should be effected by stages beginning with the south Wales docks and those at Kings Lynn, Norfolk. The docks at Hull, Yorkshire, Grimsby and Immingham, Lincolnshire, were transferred on Jan. 1, 1949, all being treated as one entity based on the Humber.

The final report of the working party on the turn-round of shipping was given special attention and measures were taken to carry out its recommendations. A joint consultative council was established. Its meetings provided opportunities for the exchange of views on the whole of inland transport. Wage questions, conditions of service or statutory committee matters were excluded.

National Dock Labour Board. In 1949 the board published its first annual report covering the period June 28, 1947, when the minister of labour’s scheme commenced, to Jan. 3, 1948. The chief difficulty arose from the lack of proper information about future labour needs. Planning on past experience proved unreliable in changing conditions and forecasts on trade developments were requested from government departments and industrialists. Port registers showed an average of 74,585 men, 91.7% available, for the half-year to Jan. 3, 1948. Certain local boards faced labour shortages and 3,000 men were recruited. Use of the scheme’s provisions was urged by transfers from other ports. The number of men working away from their home ports daily during six months averaged 520.

Clay. The reconstruction of Queen's dock was abandoned in favour of a second basin at Shieldhall. The widening of Queen's dock entrance was to proceed later. The Ministry of Civil Aviation height restrictions for buildings near Renfrew airport hampered the design of new warehouse accommodation. Hull. The first nationalized port advisory committee was formed with representatives of shipping, trading and trade union interests. Co-operating with the Humber port executive officials, the chief docks manager being chairman, it dealt with trade and facilities not dealt with by the joint industrial council.

Leith. Improvements authorized included the completion of new quays and lighthouses at the new entrance to the port and in Edinburgh dock.

Liverpool. The radar station was used by nearly 250 vessels entering or leaving the port. Its value during foggy weather was proved, continuous position information being supplied to vessels. The war-damaged Gladstone-Horny lock was repaired and put in commission in March. Princess Elizabeth opened the new entrance to Waterloo dock, thus marking the completion of the board’s £1,200,000 improvement scheme. The dock board approved a £10 million reconstruction scheme for Langton Brocklebank and Canada docks. A new entrance lock into Langton dock 825 ft. long and 130 ft. wide would abolish the existing entrance.

London. The Port of London authority celebrated its 40th birthday. An unofficial strike of dockers, from early May to July 11, cost the country a loss of 2,300 operating days and held more than 100 ships idle. A state of emergency was proclaimed, a port emergency committee was set up at the port and troops were employed to discharge food cargoes and load exports. A political issue developed owing to a warning of dismissal to strikers by the National Dock Labour board being publicly repudiated by the prime minister. The chairman, Lord Ammon, resigned his ministerial appointment as a government whip but retained the chairmanship of the National Dock Labour board. Bow Creek wharf, rebuilt after bomb damage, re-opened as one of the two main Thames iron and steel discharging points. Designs for a false quay 1,320 ft. long, 29 ft. deep alongside north quay, West India dock, were prepared and two diesel-driven floating grain elevators were ordered.

Manchester. Work on the Manchester Ship Canal company’s £4 million new oil dock for 30,000 ton tankers began at Eastham, near the entrance to the ship canal. The dock entrance lock was planned to be 800 ft. long and 100 ft. wide. A wet dock would have 40 ft. depth of water and berths equipped with modern facilities for discharging oil.

South Wales. There was increased traffic of nearly 2 million tons, principally at Swansea; but considerable unemployment occurred at Cardiff. Coal exports from all ports in south Wales were only 27% of the total throughout the country (excluding coastwise) as compared with 40% before World War II.

Southampton. At Fawley work started on Europe’s largest oil refinery (annual output 5 million tons). Four or five berths to deal with about 350 tankers annually were planned to accommodate the largest tankers foreseen. A new two-storey terminal building and a new “berth 44” for passengers for the “Queen Mary” and “Queen Elizabeth” were begun.

Sunderland. Improvement schemes at Hendon dock, provision of space by reclamation for storage and straightening and deepening of the harbour entrance channel were proceeded with; a new south pier was completed. A tidal model of harbour entrance was set up to obtain design data.

Tees. Local interests favoured an estuarian port authority, rather than regional control, with the merging of the Hartlepool’s Harbour commission, the Tees conservancy, the
Transport commission’s docks at Middlesbrough and Hartlepool, the Stockton corporation quay and private wharfing installations.

**Tyne.** Two committees of Newcastle city council advocated that all the facilities at Tyne port should be unified.

**Australia.** Legislation was adopted reconstituting the Stevedoring Industry commission which controlled port waterfront operations. The reclamation for the new Appleton dock, west of the Yarra, proceeded.

**British East Africa.** Dar es Salaam, Tanganyika, progressed towards becoming a major port capable of accommodating 600 ft. ships of 30 ft. draft. Improvements to the entrance channel, increase of the lighter fleet, additional deep water berths, cranes and rolling stock should, by 1951-52, enable the port to handle 850,000 tons of cargo annually, nearly twice the total for 1948. Construction proceeded of Mtwara port (late Mikindani).

**British West Africa.** Work was commenced on the extension and development of the harbour at Takoradi, Gold Coast. The new work, which was expected to cost £2,250,000 and was planned to be completed by 1953, included the lengthening of the quay on the north side of the harbour to accommodate six ships instead of three; the construction of new docks in the southwest corner of the harbour; the removal of Cox Fort hill and the building of sidings, cargo platforms and a cement dump on the site; and the construction of a railway maintenance centre.

**Canada.** The National Harbours board engaged in large constructional works at Montreal, Halifax and St. John, New Brunswick. At Montreal, the Jacques Cartier pier was under reconstruction. Seventy ft. long precast concrete cylinders were being used to carry a concrete deck.

**Ceylon.** Work at Colombo port included the construction of an oil jetty and two alongside quay berths, enabling direct discharge to road transport.

**France.** Works completed included repairs at Le Havre and reconstruction at Marseilles and Port du Bouc oil port (Marseilles).

**India.** The ports at Bombay, Madras, Calcutta and Cochin were given development priority. French experts visited India and surveyed many ports and planned new shipyards. Kandla was being developed into a major port, capable of handling 3 million tons annually. In Calcutta model experiments were conducted for the improvement of the river Hooghly.

**Ireland.** Work began on Sligo’s Irish-American Oil depot to store the oil demand of northwest Ireland and Donegal. The Dublin Port Works board began work on a scheme to provide additional berthing, shed accommodation and a graving dock.

**Israel.** Construction work proceeded at Haifa, and a £15 million scheme was planned for Jaffa-Tel Aviv.

**Netherlands.** A new industrial harbour of Maastricht was begun. The new inland port at Nijmegen, at the confluence of the new Maas-Waal canal with the Waal (Rhine), was taken into operation.

**Pakistan.** The development of Chittagong into a major eastern port proceeded. The programme provided for 14 additional berths.

**Portuguese East Africa.** The Portuguese government took over control of the port of Beira and improvements proceeded. A port at Nacala, north of Mozambique, was under construction.

**Singapore.** Rehabilitation and wharf dredging was completed and re-equipment proceeded.

**Sweden.** The largest dry dock for use in the Baltic was towed in seven sections from Britain to Stockholm for Finnboda shipyard.

(W. A. F.)

**United States.** In 1949, construction work was carried out on 81 regular river and harbour projects by the Corps of Engineers; of this number, 23 were completed. Maintenance work was performed on 336 projects, including the extensive intercoastal waterways and Mississippi river system, the connecting channels on the Great Lakes, the 490 navigation locks and dams and 270 harbours. During the fiscal year which ended June 30, 1949, $178,301,100 was expended on new work and on the maintenance of river and navigation projects and inland and coastal harbours.

The Rivers and Harbours act of 1949 provided $197,985,690 for maintenance and improvement of the nation’s rivers and
DOMINICAN REPUBLIC—DONATIONS

harbours. Of this total $114,145,690 was designated for new construction work on 92 projects in 34 states, the District of Columbia and Alaska. Maintenance, operation and care were allotted $77 million; advance planning, $2 million; preliminary examinations and surveys, $1,200,000; and miscellaneous items, $5,640,000.

Advance planning was executed during 1949 on 16 river and harbour projects in ten states. At the end of 1949 there were 1,036 authorized investigations in advance stages of completion. Included in the studies were the coast of California, to determine the advisability of providing harbours of refuge for small craft; major coastal harbours to determine the advisability of increasing harbour depths to accommodate the new types of deep-draught tankers and cargo ships; and beach erosion control studies of the Connecticut coast and of the Illinois coast of Lake Michigan. (See also CANALS AND INLAND WATERWAYS; STRIKES AND LOCKOUTS.)

DOMINICA: see WINDWARD ISLANDS

DOMINICAN REPUBLIC. A West Indian republic covering the eastern two-thirds of the island of Hispaniola or Haiti. Area: 19,129 sq. mi. Pop. (mid-1949 est.): 2,277,000. Racial distribution is estimated at 13% white, 68% mestizo and mulatto and 19% Negro. Ciudad Trujillo (known as Santo Domingo from the time of Christopher Columbus until 1936) is the capital, with a population (1949 est.) of 165,000. Other chief towns (pop., 1948 est.): Santiago (62,520); San Pedro de Macoris (24,200). Spanish is the language, and the predominant religion is Roman Catholic. President (in 1930-38 and from 1942): Generalissimo Rafael Leonidas Trujillo y Molina.

History. The commercial and industrial activities of the Dominican republic in 1949 were moderately stimulated by the firm markets for sugar and coffee. By the late summer, virtually all marketable supplies had been shipped abroad; and at the end of the year a genuine coffee shortage existed as in almost all the other coffee producing areas in the western hemisphere in late 1949, with famine prices being paid for inferior qualities. Nevertheless, the inflow of imports did not at once reflect this brisk activity, since the great bulk of goods imported comes from the United States and coffee and sugar generally are sold in Europe. A slight increase in European imports to the Dominican Republic was noted late in the year. Banking activities reflected the same trends of slightly slower import movement and accelerated exports. There was some expansion of housing construction and improvement in transport and in the hardwood timber trade.

President Trujillo continued to acquire, for cash, building or whatever source available. His government, which had been intermittently upon bad terms with Haiti for some years, became particularly aroused in late 1949 by the alleged existence of conspiracies in both Haiti and Cuba to overturn by violence the Dominican regime. Returning from a cruise in U.S. waters, the president called the National Congress in extraordinary session for the purpose of securing extensive war powers. The Dominican chargé d'affaires at Port-au-Prince, Haiti, was withdrawn, after he had been held incommunicado for a week, as he alleged. Sporadic reports of expeditions of exiles, starting from Cuban soil, continued to circulate through the year, after one such dimunutive expedition ended in failure.

Relations with the rest of Latin America were uneventful. The interest of the Dominican regime in European displaced persons continued to attract relatively large numbers of such immigrants, who received extensive governmental assistance.

Education. (1948) Schools, elementary and secondary, state 2,756, students 439,153, private 91 schools, 65,353, pupils 242,545. There was also a state university at Ciudad Trujillo.

Agriculture. Sugar cane is the chief crop. In the 1948-49 season 525,130 short tons of raw and refined sugar were produced. Other crops (short tons). cocoa (1947-48) 31,000; tobacco (1948-49) 24,800. Livestock ('00 head, 1946): cattle 597, pigs 547, sheep and goats 346, poultry 1,988.

Industry. Industrial establishments (1948): 4,200 including 14 sugar mills, a large chocolate plant (completed in 1948), 2 breweries and a cement plant.

Foreign Trade. (RD$, 1948) Export 82,296,399; import 65,329,183. Chief exports: sugar (51%), cocoa (20%), coffee (6%), molasses (5%) and leaf tobacco (4%). Principal imports: machinery and equipment (14%); foodstuffs (12%); iron and steel manufactures (11%), cotton and cotton manufactures (11%), motor vehicles (8%). Principal sources of imports: the U.S. (including Puerto Rico) 79%; Netherlands West Indies 4%; Canada 3-4%; India 3 4%; United Kingdom 2%; Leading customers: the U.S. (incl Puerto Rico) 37%; the United Kingdom 26%; Canada 20%. For the previous ten years the balance of trade was constantly favourable to the Dominican Republic.

Public Finance and Commercial and Revenue Accounts (1948): Total 2,389,000 RD$. Other revenue: majorly sugar companies 1,650 mi. Roads (1948) about 3,000 mi., including 500 mi. of surfaced highways. Licensed motor vehicles (Dec 1948), private cars 1,930, taxis-cabs 1,194, lorries 2,389; lorcy-trailers 44, buses 537. Telephone (1948) subscribers 2,408. Wireless licences (1948) about 20,000.

Finance and Banking. (RD$ Budget 1949 est.) revenue 66,735,260, expenditure 66,719,649. From July 21, 1947, there was external debt. Short-term and long term internal obligations: (Dec 31, 1948) RD$ 15,302,544. Notes in circulation (Nov 30, 1949): RD$ 20,690,000. The monetary unit is the peso (written RD$), officially pegged at par with the U. S. dollar.

DONATIONS AND BEQUESTS. The already high rate of death duties which was raised in the 1949 Finance act severely curtailed large bequests. The second Viscount Leverhulme, who died on May 26, left "as far as at present ascertained" (Aug 1949) £2,357,039. Death duties amounted to £1,652,475. He made only nominal charitable bequests, the largest being £1,000. The Liverpool (Church of England) Cathedral Building fund, the Congregational Union of England and Wales and the Merseyside Hospitals council each received £1,000.

Other wills of over £2,000,000 proved in 1949 included those of Viscount Portman, £4,493,000; Dowager Lady Peel, £4,274,902; Arthur Guinness, £3,182,427; Viscount Tredegar, £2,357,000; Lord Gretton, £2,302,972; Viscount Portal, £2,122,380.

During the year a personal bill was presented to the House of Lords by Countess Mountbatten of Burma. She wished to obtain greater control over her inheritance under the will of her grandfather, Sir Ernest Cassel. The bequest was subject to restrictions which prevented her dealing with the capital of over £1,400,000. It was stated that her income, after taxation, was about £4,000 a year, that the joint income of Earl and Countess Mountbatten would be one-ninth of what it had been in 1922. The bill was passed unanimously by the House of Lords but, because of opposition by Conservative members in the House of Commons, was withdrawn after a government assurance to introduce a bill to free from similar restrictions all persons affected by such bequests. The Married Women (Restraint upon Anticipation) bill was introduced by the government. It was given a second reading in the House of Lords on July 5 and in the House of Commons on Nov. 7. The attorney general estimated that the number of married women affected was "thousands, but not tens of thousands." An amendment to reject the bill was defeated in the House of Commons by 47 votes to 180.

Doubts were expressed as to whether hospitals under state control in Great Britain could still be considered charities.
In the United States, the First National Bank of Chicago applied to a court to decide whether payments from the estate of E. Stanley Holland, who died in 1936 leaving $1,300,000, should be continued to four hospitals in Britain. At the end of 1949 the application had not been decided.

Solomon R. Guggenheim, American industrialist and art patron, who died on Nov. 3, left $8 million to the foundation bearing his name. In his will he suggested that $2 million of the bequest should be used to build a museum in New York. He left to the foundation the land on which the museum was to be built. He also bequeathed his large collection of non-objective and other paintings, with the provision that his widow should have their use during her lifetime.

Sir Robert Ho-tung, a wealthy Chinese merchant, revealed that he would leave a portion of his fortune for a special trust. He stated that, although not as large as the Carnegie and Rockefeller trusts, it would be considered large in China though developments in 1949 had diminished it greatly.

During the year Nottingham university appealed for a £1 million endowment fund. Within five months £250,000 was received. The appeal was to be open for three years. James P. R. Lyell, a solicitor, bequeathed the bulk of his £39,250 estate to Oxford university, the income to endow a readership in bibliography. He gave to the Bodleian library 100 rare mediaeval manuscripts.

The Jefferson Military college, Mississippi, was offered an endowment estimated at $50 million by Judge George W. Armstrong, an oil millionaire on condition that it should teach supremacy of the white race and should exclude all persons of African or Asiatic birth or descent. The college refused the offer stating that the policies of Judge Armstrong "are not, never have been and never will be the policies of the college." (See also UNIVERSITIES AND COLLEGES.) (X.)

**DRAMA: see THEATRE.**

**DRAWING AND ENGRAVING.** Drawing, the most direct and spontaneous expression of the artist, has always tended to be a private exercise or a starting point for further work, rather than an end in itself. The print on the other hand, intended for general distribution, is as varied in its idiom as are the current trends in painting. In examining contemporary drawing it is possible to be baulked by the unrepresentative nature of the best work exhibited and to turn to the careful and commonplace recordings shown by academic groups. The strongest work seen with the British exhibiting societies during 1949 not infrequently came from sculptors. Among the more expressive offerings of the commercial galleries in London were some incisive pen studies by Sigismund Politzer; a group of William Roberts' mechanistic but delicately balanced compositions; some slight but admirable designs by Leonard Rosoman; charming recollections of Italian architecture by Katerina Wilczynski; and an impressive selection of portraits by Wyndham Lewis as part of a retrospective exhibition. Lewis, one of the most able portraitists of his generation, continued through his curved metallic forms to influence several of the younger generation. Little was seen by the more radical British artists but recent drawings were shown by Pavel Tchelitchew, at his best one of the finest of living draughtsmen.

Engraving, etching and drypoint continued to suffer an eclipse in Britain, though the work of William Hayter and others suggested a slight revival of aquatint. Generally, to find stimulating examples of these processes, it was necessary to turn to Switzerland (Hans Erm), Czechoslovakia (the Hollar society) and, pre-eminently, France (where book-production provided a steady stimulus). Without doubt lithography and the monotype were the most popular and successful means of auto-production, and here it was possible to note the emergence of a British school of peintres-graveurs capable of holding its own with any country. A high standard was shown in exhibitions at the Royal Society of British Artists and at the Redfern gallery, where among the names that stood out were Robert Colquhoun, Edwin La Dell, Ceri Richards and Humphrey Spencer. Non-figurative themes were less frequent than in Paris, where they often took precedence over the manner derived from P. Bonnard and J. E. Vuillard. British lithographs were seen in Austria, and throughout France and Germany. In London recent lithographs by Massimo Campigli and Pablo Picasso were shown, in addition to interesting collections of French prints by all processes. Leaders of the school of Paris contributed to a noteworthy set of cheap lithographs for distribution to schools in Britain.

The Society of Wood Engravers held its first London exhibition after the war. Notwithstanding names like John Farleigh, Robert Gibbins, Gertrude Hermes, Blair Hughes-Stanton and Leon Underwood, however, it would probably be true to say that the use of the wood block was less widespread than in northern and central-eastern Europe (it may be noted that the medium was particularly suited to the kind of genre treatment demanded by "socialist realism"). So far went so far as to open a permanent exhibition of contemporary graphic art. Elsewhere some lively book illustration was evident in Italy. (M. H. MN.)

**Canada.** The Society of Canadian Painter-Etchers and Engravers held its usual annual exhibition, which was supplemented by numerous others throughout the country. Prominent among the artists working in etching and dry point were David J. L. Anderson, Robert W. Anand, R. F. Darby, I. Mackinnon-Pearson, Wilbur K. Peacock, E. B. Sisley, J. R. Tate, Fred B. Taylor, Harry D. Wallace and W. J. Wood.

**United States.** During 1949 the regular large national annual exhibitions took place, of which the two most comprehensive and representative as cross sections of American etching were that conducted by the Library of Congress and the annual exhibition of the Society of American Etchers, Gravers, Lithographers and Woodcutters. Smaller exhibitions, along both national and regional lines, were held by such other long established print organizations as the Chicago Society of Etchers, the Print Makers' Society of California, the Prairie Print Makers, the Northwest Printmakers and the Print clubs of Philadelphia and Albany, while print dealers all over the country, as well as museums and libraries maintaining print rooms, held exhibitions covering all phases of etching and the allied arts.

The names of noteworthy practising etchers in the United States during the year were too numerous to mention at length. Best known among them, however, were Niels Y. Andersen, Will Barnet, Isabel Bishop, Cornelis Botke, Federico Castellon, John E. Cortigian, Stephen CModern, Ralph Fabri, Isac Friedlander, Sue Fuller, Arthur W. Hall, Eugene Higgins, Morris Henry Hobbs, Alfred Hutty, Philip Kappel, Gene Kloss, Armin Landeck, Jeannette M. Lewis, Martin Lewis, Helen A. Loggie, Luigi Lucioni, William Meyerowitz, Helen Miller, Roi Partridge, Margaret Philbrick, Carl M. Schultheiss, Reynold H. Weidenaar, R. W. Woikes and George H. Wright. (See also ART EXHIBITIONS; ART SALES.) (J. T. AS.)

**DUCLOS, JACQUES,** French politician (b. Louey, Hautes Pyrénées, Oct. 2, 1896). A pastry cook by trade, he
joined the French Communist party in 1920. Six years later he was elected member of the central committee of the party and, in 1931, its secretary general and member of the Politburo. In 1935 the 7th congress of the Comintern elected him member of its executive committee. He was a member of the French Chamber of Deputies 1924-32 and 1936-40. After the German attack on the U.S.S.R. he directed the resistance activities of the party. In 1944 he was delegate to the Consultative Assembly, and was elected deputy to the first (Oct. 21, 1945) and second (June 2, 1946) Constituent assemblies and also to the National Assembly (Nov. 10, 1946). After the liberation he presided over the Communist parliamentary group and made aggressive attacks on the successive governments after the Communist party had abandoned its policy of participation on May 4, 1947. He represented the French Communist party at the conference of Wilcza Góra in Poland, at the end of Sept. 1947, when the Cominform was founded. On Nov. 19, 1948, in the National Assembly, he denied the charge of Jules Moch, minister of the interior, that the French Communist party was financed by Moscow through the Cominform. On Oct. 13, 1949, when Moch as premier-designate was putting forward his proposed policy in the National Assembly, Duclos made a violent personal attack on him and accused him of responsibility for the death of workers in clashes with the police.

**DUTCH LITERATURE.** In the course of 1949 Dutch letters suffered a severe loss through the death of that versatile man of letters, philosopher and novelist Nico van Suihtelen (1878-1949), and of the calvinistic poet W. Hessels (alias H. Mulder, 1906-49), who, although he had lived in South Africa for a long time, still belonged to Dutch literature because of his poetry. He did not live to see the publication of his impressive collected poems under the title of *Con Sordino*.

Prose literature lacked a definite trend and style, and actually existed only by virtue of the talent of a few independent authors. There appeared a remarkable collection of short stories by F. Bordewijk dealing with the city of The Hague, *The Stork's Escutcheon*. That unusually prolific author, S. Vestdijk, published among other books, *The Feast of Life*, in collaboration with Henriette van Eyk he wrote a novel in the form of letters: *Adventure with Titia*.

With a captivating, if slightly improbable novel *Head or Tail*, Jo Boer won The Hague prize. The most successful book, however, proved to be Anna Blaman's *Solitary Adventure*, published towards the close of 1948, but twice reprinted in 1949. The discussion on immorality in art which arose as a result of this publication extended to the cleverly written novel *The Tears of the Acacias* by the young writer W. F. Hermans, which, however, lacked perspective.

In 1949 Holland commemorated the death of the famous dramatist Herman Heyermans who died in 1924; and dramatic literature was enriched by an important play by Maurits Dekker, *The World has no Waiting-room*, dealing with the atomic scientists' responsibility to mankind.

The greatest woman poet of the Netherlands, Henriette Roland Holst, who celebrated her 80th birthday on Dec. 24, published besides an interesting autobiography *The Fire Burned on* her new lyric poetry in an extensive collection, *Genesis*. Victor van Vreeswijn's collected poems appeared under the title *Triple Defence*; and Gerrit Achterberg added two new books of poetry, *Hoonte* and *Snow-white*, to the already large number of his poetical works.

By far the most important publication was the poem *In the Beginning* by Bertus Aafjes, a fantasy on the creative poet who pictures himself as Adam, giving names to animals and things and tragical in its efforts to attain an impossible unity of word and object.

The poet, J. C. Bloem, published a book containing his reviews and essays, which till then were to be found only in periodicals. S. Dresen, professor of Dutch literature at Leyden, and H. A. Gomperts also published important collections of essays. Herman Gorter's penetrating sociological and literary studies on the movement of the '80s were collected in a book, 50 years after their original publication in a socialist periodical.  

(G. Stg.)

**DUTRA, EURICO GASPAR**, Brazilian army officer and statesman (b. Cuiabá, Brazil, May 18, 1885), was elected president of Brazil on Dec. 2, 1945, and took office on Jan. 31, 1946. (For his early career see *Britannica Book of the Year* 1949.)

In May 1949 President Dutra made the first visit to the United States that had been paid by any Brazilian chief of state since that of Emperor Dom Pedro II in 1876. He was greeted by President Harry S. Truman; and on May 21 the White House announced that the two chiefs of state had reached an agreement to work out a programme for economic development and social progress. The negotiation of a cultural treaty between the two nations was also approved.

**DYESTUFFS.** It became evident in 1949 that European output of dyestuffs was keeping pace with consumption. The demand by the textile, leather and paper industries remained high but there were signs of less easy trading conditions and the directors of one large Swiss dyestuff concern went so far as to state that the postwar boom of those industries had passed its peak, at least in Europe and the United States. Even if this were not so, the principal dyestuff exporting countries of Europe would still have to realize that competing countries had increased their productive capacity after World War II and frequently enjoyed the advantage of lower production costs. Moreover, some countries were beginning to manufacture some of their own.

It was with the possible danger of overproduction of dyestuffs in mind, as well as to see what reductions in dollar expenditure might be possible, that the Chemical Products committee of the Organization for European Economic Co-operation undertook a study of seven major chemical products, one of which was dyestuffs.

Replies to a questionnaire by the committee to the various countries revealed that a considerable increase in production was anticipated:

A working party, consisting of representatives of the western European countries, was formed to make a critical study of consumption and foreign outlets, but had not yet published its report.

Dyestuff manufacturers reported a widening of interest in fast colours and specialities. There was also an increasing demand for special colours for mixed fibres.

Some light on Russian dye production was thrown by Dr. Herbert Levinstein, during an address at Bradford in 1949. The industry formed an important part of the latest five-year plan and was scheduled to produce by 1950 one-and-a-half times as much as before World War II. The target was 43,000 tons, with special emphasis on fast colours.
In Great Britain, where dyestuffs production was running at some 30% above 1948 output, proposals were made for the nationalization of the chemical industry and James Ewing, chairman of a large dyeing combine, expressed concern at the prospect of disruption of the dye manufacturing industry which, he thought, would inevitably occur. The government stated that the chemical industry would be carefully examined before it was decided to transfer any appropriate sections of the industry to public ownership. (L.E.Ms.)

The volume of dyes sold during the first seven months of 1949 was approximately 15% lower than for the same period in 1948. The tightening of consumer buying forced reductions in the textile, paper, leather and other colour-consuming industries with a resultant decrease in the consumption of dyes. The situation changed materially in August with renewed industrial activity and the demand for dyes continued strong throughout the rest of the year. Export requirements remained fairly stable despite the uncertainty of dollar exchange in many foreign countries. Little change occurred in the weighted average domestic price of dyes. A reduction of 4% was made on a few products but the unit value per pound was comparable to the previous year's figures.

Dyestuff research resulted in the marketing of a number of new products possessing better fastness and improved dyeing properties. The use of fast vat colours was extended to a broader variety of fabrics designed for various ultimate uses, which gave the consumer a high degree of colour durability. New hydrophobic and other types of synthetic fibres presented complex colouration problems but it was generally possible to provide colours and formulas adapted to the chemical characteristics of any given fibre. (A. G. B.)

**EAR, NOSE AND THROAT, DISEASES OF.**

Hemorrhage occurs in all surgery of the ear, nose and throat and is often difficult to stop. B. H. Senturia, J. H. Ogura and T. E. Walsh found that thrombin was useful in controlling veno-capillary oozing after removal of tonsils or adenoids. Brisk bleeding from Little's area (front of the central partition of the nose) or from the lateral nasal wall was not controlled. Bovine thrombin, as a sterile white powder, was used in the middle ear following radical mastoidectomy and provided a dry bed for skin grafting. It was also effective in cases of bone and soft tissue oozing, dural and lateral sinus bleeding where epinephrine adrenal was failed and where hot wire cautery was deemed inadvisable. Using absorbable sponge saturated with thrombin good results were obtained, during radical mastoidectomy, in the obliteration of inaccessible parts of the mastoid cavity prior to skin grafting. Thrombin-saturated sponge was found useful to patch lacerations and incisions of the dura (covering of the brain) jugular bulb and lateral sinus. It was used successfully as an innocuous haemostatic agent as well as a protective cushion over the exposed facial nerve. The sponge was used to protect linear tears in the membranous flap during the fenestration operation (window operation on the inner ear) for a certain type of conduction deafness. Good results were obtained in radical neck dissection where unusual bleeding followed X-ray therapy. Promising results were obtained in the use of a thin sheet of sponge as an "interseptal bridge" in cases of post-operative perforations of the nasal septum. Unsatisfactory results were obtained when the sponge was used to control brisk bleeding from the lateral nasal wall. No methods could be devised for the safe use of absorbable sponge in the oral or nasal passages.

**Antibiotics.** A. C. Forstenberg concluded that nearly all acute infections of the ear, nose, sinuses and throat respond successfully to the intramuscular administration of penicillin. Penicillin, to be effective, must come into actual contact with the affected organism and maintain a sustained contact. The difficulty of applying this principle to the upper air passages probably accounts for the disappointing results observed from the popular methods of local administration. Penicillin spray is of little value in the treatment of dilatation of the bronchial tubes although direct application through the bronchoscope of concentrated penicillin solutions to the cavities formed in this disease produced encouraging results. A dense capsule surrounding a chronic abscess in the neck, dead tissue, or a foreign body within the abscesses all forced a barrier to the antibiotic therapy. Similar difficulties in the use of penicillin were found in chronic pus-forming middle ear inflammation, in mastoiditis and in chronic nasal accessory sinus diseases. No antibiotic known in 1949 could cure these pathological entities when used systemically, locally or by both methods.

The possible injurious effects of penicillin in the absence of infection were pointed out. The normal basic flora of the throat may be altered to include harmful organisms. It could be argued that the prolonged administration of the antibiotic might produce resistant organisms, which would not respond in the future to a sorely needed antibiotic.

Streptomycin was found to be particularly effective in tuberculosis cervical gland inflammation and in tuberculous mucous membrane lesions. Its allied agent dihydrostreptomycin, comparatively free from nerve injury effects, gave promise of replacing the original antibiotic in the treatment of these conditions.

**Nasal Surgery and Rhinoplasty.** The most significant advances in nasal surgery were brought to the fore by Armand Carron, Samuel Fomon and by Dean M. Lierle and W. C. Hoffmann. There were changing concepts in the structural anatomy and surgery of the obstructing septum. As Carron pointed out, a closer liaison had been effected between physiology and nasal surgery. Both upper and lower external nasal cartilages are tremendously important in the ventilation of the lung and help to regulate the minute volume of inspired air. Detailed diagnoses of causes of collapsing alae (lower cartilages and flares of nose) and their surgical correction were clearly presented by Carron. One of the significant trends in otolaryngology in 1949 was the formal incorporation of rhinoplastic surgery in the training of all those interested in diseases of the ear, nose and throat. (See also Cold, Common.)

**EAST AFRICA, BRITISH: see British East Africa.**

**EASTERN ORTHODOX CHURCHES.** The new Occumenical Patriarch, Athinaogoras I (g.v.) was solemnly enthroned in Istanbul on Jan. 27, 1949, and the year which elapsed saw a continual sharpening of the division within the Orthodox body, between Phanar and Kremlín, Byzantium and Moscow, the Second Rome and the Third. Four days after his enthronement, Athinaogoras, who had only lately relinquished his U.S. citizenship, went to Ankara to deliver a personal message from President Harry S. Truman to President Ismet Inonu. As a gesture of satisfaction at his election the Turkish government gave him formal permission to appear publicly in his robes of office. And not only with the Americans and with the Turkish state, but—what on an historical view is more significant—with the papacy and the
Roman Catholic Church, the new Oecumenical Patriarch developed a cordiality that his predecessors had not found it possible to achieve. In his first allocution after his election Athinagoras called on the Orthodox to co-operate with all Christian Churches, including the Roman Catholic Church; in March he called on Mgr. Andrea Cassulo, Apostolic delegate to Turkey, to offer his congratulations on the tenth anniversary of the coronation of Pope Pius XII; and on Greek Independence day it was at his special invitation that Mgr. Cassulo came to hold a Roman Catholic religious service on the premises of the Greek consulate in Istanbul—these were illustrations of the greatly changed atmosphere that the new Oecumenical Patriarch introduced. The Patriarchate of Moscow, on the other hand, continued to identify itself more and more intimately with the policies of the U.S.S.R., thus lamentably accentuating its separation from most of the rest of the Orthodox world. The Moscow theologian A. Kracheninnikov, in the Journal of the Moscow Patriarchate in the autumn, went as far as anyone yet had done, when he declared that the Russian Church, in supporting the foreign policy of the Soviet government, had fulfilled "a holy duty of the religion of love" and that the position of the Russian Church had not varied "in the face of the current forces in the world today—those of progress and those of reaction." He went on to make a violent and characteristic attack on the Roman Catholic Church and the World Council of Churches, and to say that there was an "irreconcilable opposition" between the Orthodox east and the rest of Christendom. Patriarch Alexey of Moscow made a typical comment in August, when he replied to a series of questions from Reuter's agency on the papal excommunication of Communists; Athinagoras on the other hand, had expressed himself in sympathy with that Roman decree.

The division among the Orthodox reflected itself in various areas: the Patriarch of Alexandria had the reputation of feeling some sympathy with Moscow; and there were many misgivings among the Orthodox in Palestine when the Israeli parliament decided to acknowledge the claims of the Moscow patriarchate to Russian Orthodox property and institutions in Israel. In Yugoslavia Patriarch Gavrilov found some relief in Marshal Tito's quarrel with the Cominform; and other Balkan prelates, like the Metropolitan Josip of Skopje and Bishop Varnava of Sarajevo, could even be described as anti-Russian. On the other hand, the Patriarch Justinian of Rumania showed himself more and more the extreme example of a prelate committed to the Communist revolution.

In Greece, Archbishop Damaskinos (see Obituaries) of Athens, the former regent, died on May 20, and on June 4 the Holy Synod elected as his successor the Metropolitan Spiridon Vlachos of Janina. On Sept. 28 Mgr. Chrysanthos Philippidis, archbishop of Athens from 1938-41, died. During World War I he was Metropolitan of Trabzon (Trebizond), Turkey. Owing to the fact that he associated himself with the Free Pontus movement, he was tried in absenlia by a Turkish court in 1922 and sentenced to death. (M. Dk.)

**ECUADOR.** A republic on the west coast of South America, straddling the equator, bounded on the north and east by Colombia and on the east and south by Peru. Area: 104,510 sq. mi. (including the Galápagos Islands, 3,029 sq. mi.). Pop. (1948 est.): 3,562,000 of which c. 60% Indians, 30% mestizos, 9% whites, and 1% Negros. Religion: mainly Roman Catholic. Language: Spanish, but Indians speak Quechua and Jibaro. Chief towns: Quito (cap. pop., 1947 census, 200,185); Guayaquil, the main port (235,000); Cuenca (53,520). President of the republic, Galo Plaza Lasso.

**History.** Although political opposition began to coalesce in 1949, the Plaza administration remained fundamentally stable. The government pushed forward with sweeping programmes calling for land distribution and resettlement, irrigation, selective credits to farmers and other producers, and servicing of the external debt. The administration was somewhat hampered by the gradual disintegration of the National Civic Democratic movement, the hybrid organization chiefly responsible for President Plaza's election in 1948; and on June 27 the Socialist party proclaimed its "revolutionary opposition" to the government. A subversive plot was broken up on July 4, when Julio Moreno Espinosa of the Liberal-Radical party, Juan Manosalvas of the Federation of University Students and five army majors were imprisoned.

South America's most catastrophic earthquake in ten years struck Ecuador in a series of 15 tremors occurring between Aug. 5 and 7. The centre of destruction lay about 50 mi. south of Quito, and the affected area embraced about 1,500 sq. mi. and a population of approximately 300,000, of whom 100,000 were left homeless. The death roll, at first placed at 4,600, was eventually estimated to be more than 8,000, and the property damage was calculated at more than £30 million. The village of La Libertad (pop., 600) was completely buried in a mile-wide pit more than 1,500 ft. deep. Between 400 and 500 people died at Ambato, where 70% of the houses were reported to be uninhabitable. President Plaza hastened to the stricken area to learn the extent of the disaster, and reported in a radio address on Aug. 7 that in
one town of about 3,500 residents (Pelileo), about 300 survived.

Relief activities, jointly undertaken by the U.S. and other American republics, were organized within a few hours. A "mercy airlift," grouped around about 20 aeroplanes based at the Panama Canal Zone, was in operation by Aug. 7, conveying doctors, nurses and supplies to the stricken area and evacuating refugees and injured persons.

In balloting at Flushing Meadow, New York, on Oct. 20, Ecuador received a non-permanent seat on the United Nations Security Council.

On Feb. 12 a realistic radio dramatization of H. G. Wells's The War of the Worlds so terrified residents of Quito that a mob attacked and burned the building which housed both the radio station and the offices of El Comercio, the capital's leading newspaper. Twenty persons were killed in the rioting, and the property damage was estimated at £125,000. Three officials charged with responsibility for the broadcast were arrested on Feb. 15.

(1, 1.)

Education (1941) Schools: elementary 2,710, pupils 316,749; secondary 36, pupils $8,557; universities 3, students 1,755.

Agriculture. Main crops ('000 metric tons, 1948; 1949 estimates in brackets): rice 113 (91); cocoa 16 (21); cottonseed 5; coffee (1947) 9; sugar, raw value, (1947) 36; castor beans (1947) 58. Exports of balsa wood (1947) 1,130 metric tons.

EDEN, ROBERT ANTHONY, British statesman (b. Windlestone hall, County Durham, June 12, 1897), was educated at Eton and at Christchurch, Oxford, and served in World War I. In 1922 he stood as Conservative candidate at Spennymoor, Durham, and in 1923 was elected M.P. for Warwick and Leamington. He was parliamentary private secretary to Sir Austen Chamberlain, 1926-29; parliamentary under secretary, Foreign Office, 1931-33; lord privy seal, 1934-35; and was then appointed minister for League of Nations affairs. In Dec. 1935 he succeeded Sir Samuel Hoare (later Lord Templewood) as foreign secretary but in Feb. 1938 resigned because of the government's policy of appeasement. He returned to the government in Sept. 1939 as dominions secretary, and after a few months became secretary of state for war. He returned to the Foreign Office on Dec. 23, 1940, and remained in office until the general election in July 1945. He then acted as deputy leader of the opposition under Winston Churchill, handling the day-to-day activities of the Conservative party in the House of Commons. In the early months of 1949, accompanied by Commander Allan Noble, M.P., he undertook a tour of the Commonwealth, visiting Canada, New Zealand, Australia, Malaya, India and Pakistan. He returned via Italy where he was received by the Pope and Alcide De Gasperi, the prime minister.

EDUCATION. International. On Dec. 10, 1948, the United Nations general assembly in Paris approved a Declaration of Human Rights which included the following:

Article 26.—1. Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available, and higher education shall be equally accessible to all on the basis of merit.

2. Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups and shall further the activities of the United Nations for the maintenance of peace.

3. Parents have a prior right to choose the kind of education that shall be given to their children.

In 1949 U.N.E.S.C.O. published a volume entitled Human Rights resulting from a world-wide inquiry it had made. It contained the questionnaire it had issued, a selection from the replies and a report by the committee that edited the contributions.

The year 1949 saw steady growth in making and developing international contacts of most various kinds at all levels. In stimulating this growth U.N.E.S.C.O. played a considerable part.

The fourth session of the general conference of U.N.E.S.C.O., held at Paris from Sept. 19 to Oct. 5 and attended by delegates from 50 countries, was intended to be a short business meeting devoted to amending in detail the two-year programme agreed at Beirut in 1948 and approving the budget for 1950. Actually, keen debate ensued on three matters of crucial importance: the size of the budget, the range and nature of projects and the extension of U.N.E.S.C.O.'s activities in Germany. On all these antagonistic blocs of opinion revealed themselves.

A compromise fixed the 1950 budget at $8,000,000 of which $1,055,815 went to the education programme. Two international seminars prepared in 1949 on geography teaching and the improvement of text-books were fixed for 1950. A third, on illiteracy, was deferred until 1951. A majority vote carried the proposal to establish a training centre for teachers of fundamental education. The decision was taken "to study in 1950 jointly with the International Bureau of Education the problems involved in making free compulsory primary education more nearly universal and of longer duration." It was agreed to assist the interim
committee of the International Universities bureau to convene a full conference in 1950. In accordance with a recommendation of U.N.E.S.C.O.'s International Conference on Adult Education held in June an International Advisory Council on Adult Education was set up. Greek children who were victims of the civil war, Arab refugee children of Palestine and Ecuadorian child victims of the August earthquake were taken under U.N.E.S.C.O.'s wing and, despite a "walk-out" by the Czech, Hungarian and Polish delegations, it was decided to extend U.N.E.S.C.O.'s work to Germany. The conference discussed U.N.E.S.C.O.'s part in the scheme of technical assistance for economic development to under-developed countries proposed by the Economic and Social Council of U.N. and agreed a programme.

During 1949 U.N.E.S.C.O. despatched its first three educational advisory missions to member states—Afghanistan, the Philippines and Siam. (For its international conference in Denmark and seminar in India on adult education see Adult Education.)

Dr. C. E. Beeby, head of the Education department, resigned on completion of the period for which he was seconded to U.N.E.S.C.O. by the New Zealand government—a great loss to the organization.

In the autumn of 1948 the United Nations assembly voted $32 million in aid of Arab refugees from Palestine, and devised a scheme of assistance along with international voluntary bodies already in the field. Early in 1949, as soon as minimum daily rations had been assured in the refugee camps, the organization of schools for the children began. By mid-1949 U.N.E.S.C.O. was sponsoring 31 schools with over 11,000 pupils, the funds coming from the U.N.E.S.C.O. Reconstruction Emergency fund, the Lord Mayor of London’s Appeal for Children, and the Norwegian United Nations Appeal for Children committee. The schools programme was planned to end on Aug. 31 but, as it became clear that the need would continue, the U.N.E.S.C.O. executive board in June appealed successfully for sufficient funds to maintain the schools till the end of 1949. The schools gave basic education only, and preference was given to children aged 10-12 years. All the teachers were refugees.

In October U.N.E.S.C.O. organized an international conference at Charleroi, Belgium, on the rehabilitation and education of vagabond children in Europe. Recommendations were framed for submission to U.N. The conference was immediately followed by one organized by the International Federation of Children's Communities. Proposals for research projects and a plan for an international research centre for deprived and handicapped children were drawn up. Meanwhile the foreign ministers of the Brussels treaty powers (Belgium, France, Great Britain, the Netherlands, Luxembourg) announced proposals for closer association in educational and cultural matters: exchange visits by school inspectors; teachers' courses about Western Union, each country in turn being host; national exhibitions of educational material for circulation in the other countries; national lists of travel and lodging facilities for school children and students; lists of forthcoming important educational, cultural and social congresses in all five countries.

In April and May school inspectors from the other four countries spent a month in Great Britain and in May-June, in view of the probability that Germany would later be invited to join the Western Union, British inspectors spent a month there. The first teachers' course was held in England in August.

In Sept.-Oct. the European movement organized at Bruges, Belgium, an experimental three weeks' session of a "College of Europe" designed to give selected graduate students a wider European education. (See Universities and Colleges.)

International conferences, courses, summer schools and other educational exchanges were numerous. In August the Fédération Internationale Syndicale de l'Enseignement (F.I.S.E.), founded in 1946 as the teachers' branch of the World Federation of Trade Unions, held at Warsaw its first full conference. It claimed to be the largest international organization of teachers, with 3 million members. The first international congress of biochemistry, held at Cambridge, England, in August, drew delegates from 42 countries. In Aug.-Sept. a conference at New York on educational problems of cultural groups organized jointly by Teachers' college, Columbia university, and London university Institute of Education, included coloured delegates. In July the Royal India and Pakistan society held at Oxford, England, a summer school to discuss the development of cultural links between east and west. The summer schools promoted by British universities attracted hundreds of Americans and students from over 20 other countries. In April, history teachers from western Europe and the United States met in Germany to discuss the political, social and educational problems of history teaching. In August educators from 20 countries gathered in Spain to discuss educational problems ranging from teacher training to the teaching of philosophy and theology.

One-year teacher exchanges increased in number between the United Kingdom and the United States; France and the United States; the United Kingdom and the Commonwealth; and the United Kingdom and European countries. Two small new schemes were started between England and Europe: for modern language teachers (England, France, Austria) and for highly qualified teachers who were not modern language specialists (England, Denmark, Netherlands, Norway, Sweden). In August began the first great series of exchanges under the United States Fulbright act (see Universities and Colleges).

Typical of student and school child exchanges were mutual visits of university drama societies between London and
paris; visits by English secondary school drama societies, to present Shakespearian plays in Denmark and Norway; a tour of France, Great Britain and Switzerland by South African schoolboys; and the exchange for a whole term of entire school classes between Liverpool, and Poitiers, France. All were said to be the first of their kind.

Great Britain. In June the minister of education for England and Wales publicly expressed his belief that "in the perspective of educational history 1949 will be regarded as the end of one period (i.e., the transition from war to peace conditions) and the beginning of another." High standards had been restored in the schools, sufficient teachers were being trained, school building was rapidly increasing and the Further Education and Training scheme had fed industry, commerce and the professions with 75,000 well qualified young men and women.

In November, as part of the national economy drive, he announced cuts in capital and current expenditure on education. These were surprisingly slight, and for the most part to be effected by more economical planning, administration and construction. While 10% economy in school building had to be effected in 1950, and 20% thereafter, the government guaranteed that no fewer new school places would be provided than originally planned and that the teacher training programme would not be impaired.

In July the Burnham committee, negotiating body for teachers' salaries in England and Wales, agreed to discuss a proposed increase of £150 a year to the basic salary for primary and secondary school teachers. Because of the government's appeal for a general halt of increased pay demands, the local authorities' panel in October broke off discussions.

Two inquiries by teachers' associations increased the grave fears already felt in grammar secondary schools about the acute shortage of well qualified teachers of science and mathematics.

In February the Central Advisory Council for Education (Wales) issued its first full report, The Future of Secondary Education in Wales (H.M.S.O.). This proposed two types of organization: single multilateral schools covering a wide range of ability, and a dual system of grammar-technical schools for more intelligent pupils and modern-technical schools for the less intelligent.

In January the Scottish Education department announced that after 1949 the Senior Leaving certificate (taken normally at the end of a five-year secondary school course) would be awarded on a subject and no longer on a group basis. From 1950 candidates would be required to follow a course of study approved by the department but the school would decide how many subjects each took.

In October new regulations for entrance to the teaching profession ended the system whereby intending women teachers could do the first of three years' training in a secondary school. For entrance as a nongraduate any candidate must in future have a Leaving certificate showing five passes, including English and one other subject at the higher grade.

In June died Sir Frederick Ogilvie, principal of Jesus college, Oxford, a former director general of the B.B.C., and Professor H. R. Hamley, London university, internationally known as a psychologist.

Australia. The large scale immigration by which 250,000 people were expected to arrive in Australia from the United Kingdom and Europe between Jan. 1949 and June 1950 faced the education authorities with many problems including that of teaching English to foreigners. Schools were established for children and adults at all the numerous immigrant reception centres and ingenious methods devised for English teaching to foreign immigrants, especially Russians and Balts, whose languages were virtually unknown in Australia.
accepting an appointment without Church approval would be liable to punishment by the Church, and Roman Catholic parents were advised to withdraw their children's names from the register for religious teaching where teachers not approved by the Church were appointed.

In November the government announced the formation of 19 regional commissions to control religious education, supervise the political and professional education of priests and administer the property of religious organizations.

France. Once again public opinion was troubled on learning of the high proportion of failures in the baccalauréat examination—61 in 1949. There was nothing new in this—the trouble had been endemic for over 40 years—but comment revealed a growing feeling that this examination, originally intended for purposes of university entry only, was being increasingly regarded, in the words of one critic as "a snobbish social rite of admittance to the palace of culture." The trouble was regarded as the more serious because of the narrow, intensive nature of the baccalauréat course. To counteract this for would-be university students the année propédeutique (see UNIVERSITIES AND COLLEGES) was imposed in 1948, but this did not benefit the large number of candidates not intending to go to a university.

Germany. With the transfer of powers to the German Federal republic control of public education in the western zones passed to the German government. In February General B. Robertson, high commissioner-elect for the British zone, announced the formation of a British Relations board whose function would be to offer advice and assistance on educational and cultural matters in the British zone. This board, directed by the high commissioner with his political adviser as chairman, replaced the Education branch of the Control Commission for Germany (British element).

In July Robert Birley, (q.v.) educational adviser to the British high commissioner, resigned on becoming headmaster of Eton college. He was succeeded by Professor T. H. Marshall, head of the Social Science department, London School of Economics.

In October Dr. Alonzo G. Grace, head of the Education and Cultural Relations branch, United States zone, resigned on becoming professor of education at the University of Chicago.

To meet the grave shortage of teachers in the eastern zone, 36,000 men and women had, by the beginning of 1949, been given emergency courses and sent into the schools. Of these, 28,000 had received a one-year course and the other 8,000 only a few weeks. The latter worked in the schools under the direction of trained teachers.

Politics was introduced for the first time as a regular subject into the curriculum of Land Hesse.

By Jan. 1949 there were in South Schleswig 64 Danish schools with 15,692 pupils—greater numbers than ever before. This had resulted from resumption after the war, first by the British military government and later by the Schleswig-Holstein government, of the policy of permitting Danish parents to decide whether their children should attend a Danish or a German school. Most of the 64 were private schools, and in April the Schleswig-Holstein government gave the few Danish council schools the status of private school.

In the spring a series of seven Anglo-German teachers' conferences, sponsored by the British Foreign Office and organized in the British zone and Berlin by the German education authorities, enabled 35 secondary school teachers from England and Wales to discuss with over 200 German teachers and educational administrators problems ranging from fundamental aims to history teaching.

In April the Education and Cultural Relations division of the United States military government organized at Chiemsee, Bavaria, an international conference on comparative education at which some 75 Germans discussed with 75 Americans and representatives of 13 European nations the social, economic and spiritual background to education.

Greece. In March the Vocational School for Youths was founded, which was designed to train as normal citizens adolescent boys who had served with rebel forces or been in suspicious contact with them. Suggested by King Paul, it was situated on the island of Leros and, apart from government help with materials and equipment under its reconstruction program, was supported by voluntary contributions. It was sponsored by the National foundation, created in 1947 to establish technical and vocational schools.

By November the school housed 1,200 boys, mostly between the ages of 14 and 20. Illiterates were being given elementary education and secondary education was provided for older boys. There was a choice of 22 trades and pupils had complete freedom to decide which they would learn except that illiterates were debarred from technical trades. The normal period of training was 12 months. Though the primary aim
of the school was to wean youths from Communism no political instruction was given, reliance being placed on good treatment and trade training.

Greenland. The Junior Red Cross movement was introduced into all schools. In addition to the teaching of health one of its first tasks was to establish correspondence with schools in other countries.

Hungary. In September the government abolished the compulsory teaching of religion in schools and with it the traditional ceremony of singing a Te Deum at the opening of the school term. Parents could apply to have religious teaching for their children and this would be paid for by the state. Since the nationalization of schools in 1948 religious teaching had been compulsory for two hours a week.

Ireland. In January the government of the republic of Ireland appointed a Committee on National Teachers' Salaries. This produced in October a majority and a minority report. The main recommendations in the majority report, accepted by the government, were a common salary scale for women and single men beginning at £250 and rising to £525 a year and a married man's scale from £300 to £650, additional allowances for honours graduate qualifications and pensions on the same basis as civil servants. The changes were to come into effect on April 1, 1950. The minority report recommended that any new salary scales should approach those obtaining in Great Britain and Northern Ireland. The Irish National Teachers' organization characterized the new scales as "deplorable."

Luxembourg. In October an educational conference, believed to be unprecedented in that it was both international and a co-operative effort by primary and secondary school teachers, discussed means of easing racial, linguistic, religious and social tensions within a country.

It was announced that an institute of university status was to be founded by private enterprise in Luxembourg to study means of bringing about understanding between nations.

Poland. At the opening of the school year 1949-50 the Ministry of Education claimed that elementary education (7-14 years) had at last been made everywhere compulsory. It was supposed to be compulsory before World War II but in fact 500,000 children then received no schooling.

To make universal compulsion possible, 4,500 basic schools had been built between 1945 and 1949 and 5,000 teachers added to the establishment although there were 1,500,000 fewer children. In addition 6,000 nursery schools had been set up in which there were in 1949 264,000 children between the ages of three and six years. It was aimed to treble this number by 1952. In 1949 2,500 nursery school teachers were being trained.

The basic school covered the first seven years of the 11-year course which the authorities aimed to provide for every child. There were two kinds of secondary school, academic, or "general knowledge," and technical, both entered at the age of 14. In 1949 10-3 pupils in every 1,000 of the population entered elementary schools and 34 the technical—as against 6-4 and 6 respectively in 1939.

Higher education was being rapidly expanded and the campaign against adult illiteracy vigorously prosecuted; in July a census was taken with a view to organizing in 1949-50 compulsory courses for all illiterates under the age of 55.

Structural reorganization was being accompanied by the building of new curricula to match the new social order. History was being given a materialist interpretation, biology based on Michurin principles. Religious education, given by priests or laymen approved by the Church, was compulsory for two hours a week in all basic and academic schools and for one hour in technical schools with the reservation that parents could withdraw children from it. In 1949 the educational budget was 25 times as great as in 1945.

Sweden. In February the government decided to postpone parliamentary discussion of the report on the public school system issued by the 1946 School Committee which advocated far-reaching reforms because of the volume of criticism and alternative proposals received.

Turkey. Proposals were made by the fourth annual conference of Turkish teachers and accepted by the minister of education which should in time have the effect of lessening the specialization in middle schools and ivrée and of raising educational opportunity in the smaller towns and rural areas nearer to that in the large cities. The proposals included extension of the ivrée course from three to four years, the training of specialist teachers for languages only (and not, as previously, for music, art, handwork and physical education as well) and the transfer of non-specialist teachers from Istanbul and Ankara to the provinces. The universities altered their certificate system to allow teachers in training to take two or three subsidiary subjects as well as their specialized subject.

U.S.S.R. In the spring Professor Ivan Kairouz, head of the Academy of Educational Science, Moscow, became minister of education for the R.S.F.S.R. Outlining his policy in the autumn he said that the paramount task for the year 1949-50 was to raise the standard of attainment. Formal teaching was to be reduced to a minimum in language, literature and mathematics, and the greatest use made in all lessons of individual work and activity. In biology the change over to Michurin principles was to be completed. History teaching must "treat more deeply of Soviet history and show the leading role of the Communist party and its great leaders Lenin and Stalin. Attention to the "polity-philosophic content of education" leading to "a Communist outlook" was to be "implicit in all teaching and training." (H. C. D.)

United States. Educational activity in the United States during 1949 was marked by an energetic campaign to secure a federal law which would bring the level of education in the poorer states up to that of the more fortunate ones. There was a rise of religious tempers, especially between Roman Catholics and Protestants, over the issue of federal aid to education. Public interest in the improvement of material and pedagogical conditions increased, particularly in the south and west. The shortage of suitable buildings and of qualified teachers in the elementary schools continued. Efforts were intensified to reduce discrimination against minorities and to grant the Negroes equal educational rights all over the country. Discussion increased concerning the place of communists and communism in the schools; there was an increase in enrolments at all scholastic levels, but a decrease in the number of ex-service college students. The number of foreign students attending U.S. colleges and universities increased steadily and there was continued interest in international educational co-operation and in the work of U.N.E.S.C.O.

According to the U.S. Department of education, the school year 1949-50 would be marked by the following attendance figures: elementary schools, 23,377,500; high schools, 6,533,000; institutions of higher education, 2,400,000; private commercial and nursing schools, 361,000; grand total 32,671,500. The actual number of persons at all educational institutions of all kinds during 1948 was 31,880,000. With the birth rate still climbing, educational leaders predicted a rise in enrolment in elementary and high schools for several more years.

Legislation enacted by the U.S. congress during 1949 included a grant of $7-5 million to local school agencies for educational services to children on federal reservations or in defence areas; a fund for the construction of public schools and colleges in time of depression; the continuation of gifts of surplus property to schools; the restriction of federal
funds to ex-servicemen's courses which were not of an avocational or recreational nature, and the withholding of scholarships under the Atomic Energy commission programme from persons who advocated the violent overthrow of the U.S. government; and money for the instruction of Finnish and Chinese students in U.S. colleges and universities. An attempt to raise the Federal Security agency to cabinet status was defeated. Some educators felt that the U.S. Office of Education, under this plan, would fall under political control.

As in previous years, the shortage of teachers continued to be a vexing problem. This was particularly true with respect to elementary schools. Dr. Ray C. Maul's study for the National Education association revealed that there were 260,000 elementary school teachers who lacked proper qualifications for their duties; that only 28,000 qualified teachers were being made available by the teachers colleges for elementary school service in Sept. 1949, whereas there existed a need for 150,000 elementary teachers; and that there were 65,000 college graduates prepared to teach in the high schools, with only 30,000 positions available. Enrolment in the teachers colleges showed an increase in 1949, according to the annual surveys of the Office of Education and of President Raymond Walters of the University of Cincinnati. The latter reported an overall total of 153,099 full-time and part-time students in 104 accredited teachers colleges, a rise of 14% over the enrolment in 1948. The annual report by the National Education association, released toward the end of 1949, contained important data about the teacher problem. This document stated that 36,000 more teachers were needed for the nation's schools, at least 28,800 of whom were urgently required for the elementary classes. In addition, the report pointed out that the increase of 20,000 teachers was insufficient to meet the demand; that, on account of the deplorable school conditions, a total of 250,000 children were attending half sessions in many school systems; and that at least four million more pupils were receiving poor educational service.

There was evidence in 1949 that a concerted effort was being made to obtain equal rights in education for all citizens. Special attention was given to the problem of improving the Negro's educational status in the south. There was little doubt that the Negro schools had a long way to go to catch up with those of the rest of the population. The southern regional council revealed in January that a sum of $545 million was necessary to improve Negro school buildings to the level of the "white" schools.

The most important incident involving Roman Catholics grew out of the denunciation in June by Cardinal Spellman of the Barden bill. This bill, which was held up in the house of representatives, would allot $300 million annually to the states, but would restrict the grants to public, tax-supported schools and ban the extension of auxiliary school services to the non-public schools. After criticism of the principle of federal aid to sectarian schools had been expressed by Mrs. Franklin D. Roosevelt in her newspaper column, the cardinal published a letter sent to Mrs. Roosevelt in which he disagreed sharply with her point of view. His use of uncomplimentary terms towards Mrs. Roosevelt led to a lively exchange of opinion in the press by supporters—leading clergymen, educationalists, legislators and citizens of all faiths—of the two disputants. In spite of the later reconciliation of the overt differences between the cardinal and Mrs. Roosevelt, it was evident to objective observers that both federal aid to education and relations between the faiths suffered damage during this debate.

According to a census by the Institute of International Education in April, there was a total of 26,759 foreign students, representing 151 nations and 152 religions, in 1,115 colleges and technical schools in the United States. The Department of the Army brought 193 students from occupied countries, 115 of whom came from Germany, in accordance with its democratic re-education programme. A public law passed by congress in August provided that Finland's future payment on its debt incurred during World War I should be applied for educational and technical instruction in the United States for citizens of Finland and for similar purposes. A public law passed in October set aside $4 million for the tuition and expenses of Chinese students stranded in the U.S. because of the civil war in China. Changes were made in the administration of the programme of graduate scholarships under the Fulbright act. Henceforth American applicants were to be chosen by a decentralized procedure, the initial screening to be performed by the individual colleges. In all, 614 U.S. graduate students obtained grants to study in foreign countries under the Fulbright programme during 1949-50. Of those receiving grants, 267 students went to France, 140 to Italy, 122 to Great Britain and the remainder to seven other countries. Luxembourg and Persia were also named as eligible to receive Fulbright scholars during 1950-51. (See also ADULT EDUCATION; CAMBRIDGE UNIVERSITY; LIBRARIES; LONDON UNIVERSITY; OXFORD UNIVERSITY; TEACHERS, TRAINING; TECHNICAL EDUCATION; UNIVERSITIES AND COLLEGES.)

EGYPT. An independent kingdom of northeast Africa, bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, E. by Israel and the Red sea, W. by Cyrenaica and the Sahara. Area: 386,110 sq. mi., but the cultivated and settled area (the Nile valley, delta and oases) covers only 13,496 sq. mi. Pop.: (March 26-27, 1947, census) 19,087,304; (mid-1948 est.) 19,528,000. Language: mainly Arabic (97%), but there are minorities speaking Greek, Italian, Armenian, French, Turkish etc. Religions: Moslem (mainly Sunnites) 91-4%; Christian (mainly Copts) 8-19%; Jewish 0-4%; among the non-Coptic Christians there were (1937 census):

![The Holy Carpet leaving Cairo for Mecca in Sept. 1949. In Mecca the carpet is placed in the Ka'ba.](image-url)
Roman Catholics (all rites) 126,500, Greek Orthodox 105,000, Protestants 78,200, Gregorian Armenians 17,200, etc. Chief towns (pop., 1947 census): Cairo (q.v.) (cap., 2,100,506); Alexandria (925,081); Port Said (178,432); Tanta (139,965); Mahalla el Kubra (115,509); Suez (108,250); Mansura (102,709). Ruler: King Farouk I (q.v.); prime ministers in 1949, Ibrahim Abdulhadi Pasha and (from July 25) Hussein Sirry Pasha (q.v.), who was also minister of foreign affairs.

History. The year began ominously under the shadow of the assassination on Dec. 28, 1948, of Mahmud Fahmy el Nokrasy Pasha, the prime minister. The murderer claimed to be a member of the increasingly fanatical Moslem Brotherhood, whose leader, Sheikh Hassan el Banna, was himself assassinated on Feb. 13, 1949.

The king appointed Ibrahim Abdulhadi Pasha, an experienced politician who was then holding the office of minister of finance, to be prime minister. The new premier, an independent in politics, added several Independents to the existing cabinet of Liberals and Saadists. On Feb. 27 Ahmed Mohamed Khashaba Pasha became minister of foreign affairs.

The government's first task was to restore the situation which had arisen from Egypt's participation in the unsuccessful intervention of the Arab League in the affairs of Palestine. Already the state of Israel was recognized de facto by the most powerful states in the world—although not by any important oriental power. On Feb. 3, Egypt, following a Pakistani example, denounced these recognitions which, it was claimed, implied the acceptance of the rule of force.

At the beginning of the year, Egyptian military and naval forces were still in contact with the Israelis and, on Jan. 5, the latter achieved several penetrations into Egyptian territory, drawing an expression of concern from the British Foreign Office. However, the acting mediator, Dr. R. J. Bunche (q.v.) announced a cease fire as from Jan. 7, which was followed by armistice negotiations under its chairmanship. These were successfully concluded by an agreement signed on Feb. 24. This provided for the evacuation of Faluja, by Egyptian, and of Bir Asluj, by Israeli forces, with a demarcation line between the two rival armies in the Negev, which, running some 20 mi. south of Tel Aviv, left Gaza in Egyptian and Beersheba in Israeli hands. Provision was also made for the limitation of the armed forces to be maintained by either party in the area.

In April, Colonel Husni ez-Zaim (see Obituaries) flew to Cairo for talks with King Farouk, which were followed, on his part, by the declaration, satisfactory to Egyptian leaders, that he was opposed to any plan for a Greater Syria, and, on the part of the Egyptian government, by the recognition of his regime on April 23.

There was less interest in, and less public recrimination about, the relations between Egypt and the United Kingdom than there had been for several years, although echoes of old and still unresolved disputes were to be heard pretty generally in the clamour of Egyptian internal politics. The United Kingdom expressed concern at the invasion of Egyptian territory by Israeli forces early in the year. On May 30 it protested to the Egyptian government against the excessive delays to which United Kingdom shipping was being subjected in the Suez canal, as a result of Egyptian contraband control measures. In this it was followed in November by both Italy and the U.S.S.R. Meanwhile the British under secretary of state announced "partial satisfaction" to the House of Commons.

A very important event of the year was the conclusion, on March 7, after long negotiations, of a new agreement between the Egyptian government and the Suez Canal company (q.v.). By this, Egypt was to receive a much increased share in the profits of the company and to acquire, by 1964, five additional seats on the board of directors, bringing her total representation up to seven. There was to be a big increase in the numbers of Egyptians employed by the company and large constructional works were to be undertaken which would eventually allow the passage of 60, instead of the present 35, ships a day through the canal. The free passage of ships under 300 tons would chiefly benefit Egyptian coastal shipping. This agreement was to hold good until the expiry of the existing concession, in Nov. 1968, which, it was stated, the Egyptian government did not propose to renew. On March 31 an agreement, covering sterling balances and dollar releases for the year, was arrived at.

Of greater importance for the future, perhaps, was an agreement announced by the British foreign secretary in May, whereby Egypt was to participate (sharing on the basis of £4.5 million and £7.5 million respectively with Uganda) in the cost of a project to raise the level of Lake Victoria, at the head waters of the White Nile, thereby providing power for the industrialization of Uganda and a greatly increased flow of water to Egypt. An announcement on July 6 made it known that the government had decided upon the erection of a factory in Egypt for the manufacture of fighter aircraft. A credit of £400,000 for this purpose was agreed to without opposition.

In June Egyptians celebrated the closing, in accordance with the terms of the Montreux convention, of the mixed courts, the last vestige of the Ottoman regime of "capitulations" which had long been regarded as a privilege allowing Europeans to evade effective subjection to Egyptian justice. Similarly the foreign consular courts closed down on Oct. 14.

Meanwhile, political life was dominated by internal struggles and the prospect of an election, which must be held when parliament should have served its full term of five years, early in 1950. On July 26 the government of Ibrahim Abdulhadi Pasha resigned, chiefly, it was understood, owing to a dispute between the Saadist and Liberal parties as to the
distribution of seats at the forthcoming election. Because of the refusal of the Wafd to participate in the 1945 election, these two parties held by far the greater number of seats in the house; but the Wafd announced its intention of taking a full part in the next election. On July 26 King Farouk announced to Sirry Pasha to form an all-party “care-taker” coalition government. It was then announced that elections would take place in October and that they would be held under full constitutional guarantees. Circumstances, however, necessitated a change in this plan.

On Nov. 3, unable to obtain agreement of the political parties to the draft scheme for the redistribution of constituencies, Sirry Pasha resigned. Entrusted at once by the king with the formation of a new government, he accomplished this task on the same day. His new cabinet was composed of non-party men whose tasks were clearly those of routine administration, the delimitation of constituencies and the conduct of elections to be held in Jan. 1950. (H. S. D.)

Agriculture. Main crops (in '000 metric tons, 1948): cotton, ginned, 386; maize, 1,409; wheat, 1,080; rice, 1,308; onions 195; sugar, raw, 2,000. Livestock (in '000 head): sheep 19,139; goats 19,139; cattle (July 1947) 1,474; cattle (July 1947) 1,318; buffaloes (July 1947) 1,239; asses (July 1947) 1,125; camels (Jan. 1945) 162; horses (July 1947) 25; chickens (July 1947) 16,294. Fisheries. Approximate annual catch 53,000 metric tons; value £2 million.

Foreign Trade. Imports: (1948) £1,600,000 million; (1949, six months) £881 million. Exports: (1948) £1,413 million; (1949, six months) £73-6 million.

EINAUDI, LUIGI, Italian economist and statesman (b. Carrù, Piedmont, March 24, 1874). For his early career see Britannica Book of the Year 1949.

After the liberation of Italy, Einaudi, on Jan. 4, 1945, was appointed governor of the Bank of Italy. On June 1, 1947, he joined the De Gasperi (q.v.) cabinet as deputy prime minister and minister of the budget. On May 11, 1948, he was elected second president of the Italian republic. On Dec. 15, 1948, he paid an official visit to Pope Pius XII in the Vatican city. On Nov. 9, 1949, he received a gold medal from the University of Turin to mark his formal retirement from teaching.

EIRE: see IRELAND, REPUBLIC OF.

ELECTIONS, Commonwealth. During 1949 general elections took place in three British dominions: Australia, Canada and New Zealand.

Australia. At the time of the elections held on Dec. 10 out of a population of 7,581,000 over 3,500,000 men and women were on the electoral register. As voting in Australia was compulsory, over 91% voted to elect a new House of Representatives of 123 members (instead of 75) and a new Senate of 60 members (instead of 36). The results of the voting for the House of Representatives, as compared with four previous elections, were as follows:

Canada. On June 27 the Liberal party was returned to office by a vote which gave it the largest majority in the history of the House of Commons. The distribution of seats—compared with those of Oct. 14, 1935, of March 26, 1940, and of June 11, 1949—was as follows:

<table>

For Alberta, which remained faithful to its Social Credit party, the Liberals carried every province. In French-speaking Quebec they won 68 out of 73 seats. It was generally considered that the electoral alliance concluded by the Progressive Conservative party with the Quebec isolationist Union Nationale had been a tactical error.

New Zealand. On Nov. 30 the 14 years’ rule of the Labour party which had been in gradual decline since coming somewhat unexpectedly to power in 1935 was broken by decisive defeat at the polls. From 1946 the European seats were equally divided between the Labour party and National opposition and the government relied only on the four Maori members to keep them in office. The results of the elections (by majority system), as compared with the four previous ones, were as follows:

<table>

</tbody>
</table>
In the House of Representatives elected on Nov. 30 the Labour party retained the four Maori seats in a poll which took place one day before polling in the European constituencies. Of 1,041,772 votes recorded, the National party polled 544,682 (52·63%), the Labour party 481,606 (46·54%) and other candidates 8,588 (0-83%); 93·54% of the electors went to the polls—the highest percentage in the history of the dominion.

Europe. Among 16 European democracies Great Britain was the only country to have a lower house elected by a simple majority system; 13 countries adopted proportional representation with a party list; the republic of Ireland retained the so-called single transferable vote system and Western Germany combined the majority system with proportional representation. During 1949 general elections were held in Austria, Belgium, Bulgaria, Germany, Hungary, Iceland, Norway and Portugal.

Austria. Elections for the National Assembly were held on Oct. 9 and the Austrian voters went to the polls for the second time after the end of World War II. Before the elections of Nov. 25, 1945, there were in Austria 3,419,605 electors on the voting register. In Oct. 1949 4,391,815 persons were entitled to vote. The bulk of the new voters were former nazis or nazi sympathizers who had been disfranchised in the 1945 elections; there were also about 280,000 prisoners of war who had returned home and some 180,000 newly naturalized Volksdeutsche. The results of the elections compared with those of 1945, were as follows:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

An estimated 94% of registered voters went to the polls. There were indications that the Independents (Wahlpartei der Unabhängigen) owed their comparative success to the votes for re-enfranchised ex-nazis.

Belgium. In accordance with the census of Dec. 31, 1947, the distribution of seats in the parliament was modified. There were 212 seats in the Chamber of Deputies instead of 202. A compromise left unaltered the number of Walloon seats, and allowed eight more seats to the Flemish region and two more to the bilingual Greater Brussels area, so that the proportion was 104 Flemish, 76 Walloon and 32 Brussels representatives. In the Senate the division was not so apparent, as its composition was more complex: 106 senators (101 in 1946) were returned by the same electorate as the Chamber of Deputies, 46 were chosen by the councils of the nine provinces and 23 were co-opted by senators already elected. For the first time women went to the polls. Before the elections of Feb. 17, 1946, the total of registered electors was 2,724,796, but in the elections of June 26, 1949, 2,930,270 women were entitled to take part as well as 2,705,182 men. The votes cast for the Chamber of Deputies, compared with those of 1946, were as follows:

<table>

</tbody>
</table>

Although in Belgium voting is compulsory 10-7% of the registered voters did not present themselves at the polls. The “royal question” played a prominent part in the elections. The Social Christian party, which advocated the abolition of the regency and the return of King Leopold III (q.v.) from exile, failed to gain an absolute majority in the Chamber of Deputies, but achieved a small one in the Senate.

The elections were a relative success for the Liberals and a defeat for the Communists.

Bulgaria. The elections held on Dec. 18 were in effect a plebiscite for single lists of candidates of the Fatherland Front comprising only the Communist party and the rump Agrarian union. It was officially announced that out of the electorate of 4,751,849 the total votes cast numbered 4,698,979 (98-9%) and that 4,588,996 (97·6%) votes were cast for the Fatherland front. There were 110,080 blank or spoiled papers. In the elections held on Oct. 27, 1946, the opposition polled 1,214,480 (30%) of the total votes cast and obtained 101 seats out of 465. In 1949 opposition could be expressed only by abstaining or by putting a blank sheet in the ballot envelope. The number of seats of the Assembly was reduced from 465 to 239.

Germany. For the first time for 17 years the people of Western Germany took part in free and democratic elections to a central parliament. No comparison was possible between the last free Reichstag elections of Nov. 1932 and the Bundestag elections of Aug. 14, 1949, as the latter were limited to the three western zones and the Bundestag represented only 42 million out of 67 million Germans. Between June 1946 and May 1947, however, nine Länder and two free cities of Western Germany elected their Landtage and it was possible to compare the percentages of seats gained by parties in the provincial Landtage counted together and the Bonn parliament respectively. The results of the August elections, arranged from the Right to the Left, were as follows:

<table>

</tbody>
</table>

Of 31,179,422 voters 78-5% went to the polls. About 6-7 million did not vote. Out of 402 members of the Bundestag 242 were elected directly, that is, in one-member constituencies by simple majority, and 160 seats were allotted to the parties according to their voting strength. As the table shows, the proportional representation for 40% of the seats favoured mainly small parties: without it the German Right party and Loritz's W.A.V., as well as the Zentrum and the Communists, would not have been represented at all.

On May 15 and 16 elections took place for the People's Congress in the Soviet zone. In spite of strong pressure to vote for a single list of Communist-sponsored candidates one-third of the electors voted against the Communist nominees. According to the published figures, of the 12,887,234 who went to the polls, 4,080,272 voted against the Volksrat's list of candidates.

Hungary. The elections took place on May 15, the Ministry of the Interior announcing three days later that out of the electorate of 6,053,972 the total votes cast numbered 5,730,519 (94-6%) and that 5,478,515 (95-6%) votes were cast for the People's Independence front and 165,283 against, with 86,721 spoiled papers. No opposition candidates were tolerated. In the pre-arranged composition of the new
National Assembly 270 seats out of 395 were allocated to the United Workers' (Communist) party. In the Assembly elected on Aug. 31, 1947, the Communists won 100 seats out of 411 and in that elected on Nov. 4, 1945, 69 seats out of 409.

Iceland. Elections for the Althing of 52 members were held on Oct. 23. The political composition of the new parliament compared with that elected on June 30, 1946, was as follows:

<table>
<thead>
<tr>
<th>Seats</th>

The total number of registered voters was 83,400, of whom over 33,000 were resident in Reykjavik.

Norway. On Oct. 10 the Norwegian people renewed their Storting of 150 members for the second time after the liberation. The results of the general elections, compared with those of Oct. 8, 1945, were as follows:

<table>
<thead>
<tr>
<th>1945</th>
<th>1949</th>
</tr>
</thead>
<tbody>
<tr>

The total poll, a record for Norway, was 87% as against 76% in 1945, the total number of valid votes being 1,748,246 as against 1,484,185 in 1945. The Labour party, which in 1945 had secured for the first time a clear majority in the Storting, improved its position considerably although it did not obtain an absolute majority of votes. The Communists, who before World War II had no representation in the Storting, lost the 11 seats gained in 1945.

Portugal. Elections for the National Assembly of 120 members were held on Nov. 13. In the four elections already held under the constitution of 1933 the only list presented was that of the União Nacional. In Nov. 1945 a Democratic opposition had been formed but boycotted the election. The boycott was renewed in Nov. 1949 but in two constituencies there were two opposition lists, with a total of eight candidates: at Castelo Branco a list of Constitutional Republicans and young Monarchists was led by Dr. Cunha Leal; at Portalegre the list was headed by a Monarchist, Pequito Rebelo. Both the opposition lists were defeated and all the candidates of the government party, half of them civil servants, were elected.

Other Countries. Israel. Eight months after coming into being as an independent state, Israel held elections on Jan. 25. A total of 440,095 people, over 90% of the electorate, went to the polls. The results were as follows:

<table>

*Mapai or Milhelet Poleti Eretz Israel, 1Mapai or Milhelet Poleti Menoukhedet.

The party list method was used with proportional representation applied to the whole country as one constituency. As 3,500 votes were needed to obtain one seat, nine splinter parties were eliminated.

Japan. Elections of a new Diet of 466 members took place on Jan. 23. The distribution of seats—compared with that of April 10, 1946, and of April 25, 1947—was as follows:

<table>
<thead>
<tr>

</table>

There were 30·5 million votes cast which represented 70% of the registered voters. The Liberal (Conservative) party obtained 13·4 million votes (43·8%) and gained an absolute majority in the Diet. The Social Democrats lost two-thirds of their seats. The elections also marked some success for the Communists who received 2,900,000 votes (9·6%).

(K. Sm.)

ELECTRICAL INDUSTRIES. During 1949 electrical manufacturing continued to be influenced very strongly by the urgent need for generating plant and for high-tension transmission equipment by which power could be transported from distant generating points to load centres. There was evidence, also, of efforts to overcome currency difficulties by substitution of readily available raw materials for those which had to be imported. In European countries the emphasis was upon exports, particularly to dollar areas, even to the possible detriment of their internal supply of electrical equipment. Currency devaluations in Sept. 1949 helped in this direction.

The British Electrical and Allied Manufacturers' association issued the first edition of a most comprehensive catalogue of British electrical products, from heavy power plant to domestic appliances, to assist the export drive by providing authoritative information to overseas buyers.

Further measures were taken to assist development of transmission and distribution equipment by increased standardization. The council of the International Electrical-technical commission met at Stresa, Italy, in June. One of its committees reviewed the list of standard voltages for A.C. systems and extended it up to 400 kilovolts. Others considered a draft international specification for porcelain insulators, tests upon transformer oils, specifications for oil circuit breakers and for ionic converters.

Research. Atomic energy research in the United Kingdom, the Commonwealth and the United States continued very actively; new establishments were planned and their construction commenced, but doubts continued to be expressed concerning the ultimate economy of that source of energy for electricity generation. Further study of tidal power schemes was carried out and the construction of a model of the Severn estuary for experimental research was planned.

Investigations on the possibilities of wind power for electricity generation on a large scale made good progress, and preparations were made to install two 100 kilowatt wind-driven generators, one in Orkney by the North of Scotland Hydro-Electric board and one by the British Electricity authority, to gain operating experience. The Hydro-Electric board, and also the Ministry of Fuel and Power sponsored research on the burning of peat in gas turbines for electricity generation.

An Electricity Supply Research council was set up by the British Electricity authority to keep under review questions affecting electricity supply; to advise on specific supply problems and to make recommendations on research which
should be initiated. In the industrial field research followed the prevailing trend of emphasis on large generating plant and super-tension transmission, although important work was also done on the development of new manufacturing materials, on public and industrial lighting and heating and on the utilization of electricity for industrial and agricultural power purposes.

Cable research was very active, particularly in the direction of developing cables to work at A.C. voltages of up to 300 kilovolts, for D.C. voltages of the order of 500 to 1,000 kv. and for submarine transmission of power over long distances. Arrangements were made to test a British 220-kv. cable connected to the French 220-kv. network over a long period. In switchgear for 200 kv. and above, a breaking capacity of 2,500 megavolt-amperes or 5,000 Mva. may be needed; research and development work on such gear was proceeding. For economy when transmission voltages of 300 to 400 kv. are used, the largest transformers which can be transported will be needed, so that means of reducing transformer weight were being investigated. There was a tendency towards the adoption of groups of single-phase units for very high voltages and outputs because of transport limitations.

A short length of 275-kv. line was erected by the British Electricity authority. On this 4-unit strings of insulators were to be used, the units having a semi-conducting glaze. The technique of manufacturing porcelain insulators with semi-conducting ceramic glazes was a significant development; such insulators gave a remarkably good performance in humid and polluted atmospheres. These glazes were especially useful in controlling voltage distribution on high-voltage air-break switchgear and they were used on 132-kv. cable sealing ends.

Information was published on research on magnetic materials and on the remarkable improvements made during and after World War II in the characteristics of electrical steels and other ferro-magnetic materials used in radar and nuclear physics.

Generating Plant. In Great Britain steam turbo-generators for public supply power stations were standardized at 30 or 60 Mw. and the former was approximately the average size of set in use. In view of the need to increase generating capacity as quickly as possible the installation of larger sets was becoming more common and this average appeared likely to rise during the next few years to between 40 and 50 kw. In the United States a single-shaft set of 161,760 kilovolts-amperes was being designed to operate at a steam pressure of 1,250 lb. per sq. in. and 950°F. The generator was to be hydrogen cooled.

Walsall power station, the second of the 38 new stations inaugurated since nationalization in Great Britain was officially opened on Sept. 30. It had then in operation two 30 Mw. sets but would have a total capacity of 180 Mw. by 1952. In the same B.E.A. division two further new stations, one of 210 Mw. and the other 120 Mw. were under construction. In addition to large gas turbines being constructed for the B.E.A. and North of Scotland Hydro-Electric board, a simple open-cycle gas turbine unit to drive a 750-kw. alternator was developed as a private venture by an English manufacturer. It was intended to be a general purpose, long-life prime mover. Another type of 1,000 kw. gas turbine and generator for base load operation was under construction for the Admiralty.

Transmission and Distribution. As an extension of the grid system of the B.E.A., a 33-kv. submarine cable, the largest cable of this voltage ever installed in Great Britain, was laid across the Solent from Gurnard, Isle of Wight, to Lepe in Hampshire. Of total length 2-9 mi., it was approximately 6 in. diameter and weighed 132 lb. a yard. Another submarine cable (for telephone circuits) 80 mi. long was laid between eastern England and Holland. Its main insulation was of telechene, a new polythene-base insulating material.

Up to June, 1949, the total of orders placed with British transformer manufacturers during the past few years for transformers to operate at 200 kv. and over was 1,187,000 kva. in 18 installations. These included 120,000 kva. at 242 kv. for the U.S.S.R. in 1942 and other groups at 220 kv. for Holland and Finland.

The cuts in capital expenditure announced by Sir Stafford Cripps in October included one for electricity distribution which was expected to cause some check to rural electrification during 1950. This was unfortunate in view of the excellent work done by the area boards and Electrical Development association, at agricultural shows throughout the country, to inform farmers on the uses of electricity in agriculture.

Utilization. An important event was the official opening by the minister of transport on Sept. 26 of the electrified railway service between Liverpool Street station, London, and Shenfield. The work was started in 1939 but was suspended during the war. An overhead system operated at 1,500 volts d.c. was used, the power supply being at 33 kv. from the grid. Rectification was by twin, 1,000-kw., six-anode, pulpless, steel tank rectifiers. The rolling stock comprised 92 three-coach sets, the motor coaches each having four 210-h.p. motors. Another railway electrification scheme—for Brazil—involved the manufacture by a British firm of 15 3,000-h.p., 3,000-volt d.c. mixed traffic locomotives. These were the largest type ever manufactured in Britain and would be used on a 64-km. length of main line then being electrified. One locomotive could haul a load of 600 tons at 45 m.p.h. on the level or at 20 m.p.h. up a 2-5% gradient. Electric vehicles gained further in popularity. At the Dairy show, at Olympia, London, in October, nine manufacturers showed various types. Almost three-quarters of all the machinery and appliances exhibited at this show was electrically operated. Two makes of dairy sterilizer were of the thermal storage type, which thus followed the general trend of agricultural electrical equipment towards low electric loading and off-peak operation. Barn hay-drying by cold air blowing and electric soil warming in glasshouses was being adopted. Electric hoists were prominent and included one with stable creep control specially suited to cranes.

Owing to their simplicity in installation, ease of control and clean melting, induction furnaces continued to gain in popularity. A new 25-kw. radio frequency unit was built which was capable of melting 20 lb. of ferrous metal in 20 to 30 min. Its operating frequency was 600 kilocycles per sec.

Interest in the possibilities of residential heat pumps, of a few kilowatts capacity, was strong and increasing. Unfortunately their capital cost was high. For economy in use they were to be applied to summer cooling as well as to winter heating. Research and development were devoted to investigation of heat sources and their economic utilization and towards reducing the cost of construction.

In Great Britain in April the restriction on electric lighting for display purposes was removed until October. This focussed attention on display lighting, and the Silver Jubilee meeting of the Association of Public Lighting Engineers in London in September provided the occasion for a full discussion of all aspects of public lighting. Fluorescent lighting made further strides and was being extended to underground railway trains. An important development was the colour matching fluorescent tube. The specially developed lighting equipment for the huge assembly hall, 74 ac. in floor area, at Bristol in which the Brabazon I was built created much interest. At the mounting height of 75 ft. above the floor high efficiency lamps could be used without risk of glare. A combination of 1,500-w. tungsten filament and 400-w. mercury vapour discharge lamps was installed.
Materials. Advances in insulating materials included the application of asbestos paper impregnated, with a heat-resistant varnish for high temperature uses, and a new fabric 'Terylene' which had very low moisture absorption and could withstand 180°C. Improved methods of manufacture for electrical sheet steel led to a much lower iron loss, higher permeability and greater mechanical strength. Much interest was shown in the new 'ferries'—developed through research in Holland during the war. Non-metallie magnetic materials having high permeability and very high resistivity resulted from the mixture of certain oxides (ferries) by a sintering process.

Aluminium and light metal alloys were put to new uses. Aluminium alloy conductors and zinc alloy fittings were employed for wiring circuits and a series of notes on the subject was published by the Institute of Electrical Engineers' Wiring Regulations committee. In Norway, which had an increasing output of aluminium, its use for overhead line pylons was under consideration. Again, the world shortage of lead, as well as its poor mechanical properties and high weight, led to the introduction of aluminium sheathing for cables of all types.

Electrical Exports. The need to export from Great Britain electrical machinery and equipment for which there was a good overseas market became even more urgent than in 1948. Although in the earlier months there was some reduction in the value of such exports, the Board of Trade figure for the value of exports of electrical goods and apparatus in the first 10 months of 1949 was £66,595,797 which compared with £59,701,393 for the same period in 1948. (E. W. G.)

United States. Electric utility customers bought 248,750 million kwh. of energy in 1949, an increase of 8,010 million kwh. on 1948. Sales to residential and rural customers continued to grow and were 65,925 million kwh., about 8,600 million more than in 1948. Average annual residential use of electricity rose from 1,563 kwh. in 1948 to 1,685 kwh. in 1949. Customers paid the electric utilities $4,611 million in 1949, about $298 million more than in 1948, a 6.9% increase. The average revenue from all customers in 1949 was 1.85 cents per kwh. as against 1.79 cents in 1948.

The number of customers served in 1949 grew to a total of 42,836,000, an increase of 2,114,000 over 1948. The largest increase was in the residential class. The number of people in homes served by electricity in 1949 was about 137.5 million or approximately 95% of the total population.

New capital entering the business in 1949 was $1,445 million as compared with $1,314 million in 1948, and $576 million in 1947. The total financing in 1949 was thus $1,793 million. The share of the revenue available for dividends and surplus rose in 1949, due to increased revenues and higher operating efficiency. In 1947, the proportion was 18.2 cents; in 1948 it fell to 16.7 cents; in 1949 it increased to 18.2 cents. The gross operating revenue of power companies rose from $3,903 million in 1948 to $4,150 million in 1949. Money left for net income in 1949 was $778 million, $108 million greater than the net income reported in 1948.

In 1949, the Federal Reserve board index of general industrial production dropped to 203. 8 points below 1948. The electrical production index dropped to 429, 48 points below 1948 and only 14 points above 1947. Following a distinct slowing-up of production in 1948, electrical goods for industrial installation continued to decline in 1949. (See also Broadcasting; Radio, Scientific Developments in; Television.)

(E. J. K.)

ELECTRIC POWER. In spite of political and economic difficulties resulting in some curtailment of capital expenditure on generation and transmission plant, the efforts to rectify the widespread deficit in electric power plant continued in 1949. The position of power capacity and energy production in western Europe was clearly set out in a report of the Electricity committee of the Organization for European Economic Co-operation issued during the year. This showed that an estimated deficit of 8-5 million kilowatts in 1949 would be likely to rise, through increasing demand, to a deficit of 20 million kw. by June 1952 and that the new construction planned would still leave a gap of 4 to 5 million kw. or 16,000 million kwh. a year.

Conditions in the electrical manufacturing industry showed improvement and this assisted the effort to provide the much needed generating equipment. The difficulties of the international monetary position, particularly of dollar shortages, were a handicap which might however disappear under the arrangements being made for economic co-operation. Developments in new forms of generating plant made progress. Several large gas-turbine sets were nearing completion in readiness for being put into service in 1950 or 1951. The application of atomic energy to electricity generation was brought nearer to fulfilment by much active research and by the decision to establish in Great Britain a new experimental station; but the practical realization of atomic power stations remained a comparatively long-term project. The possibilities of tidal power, particularly from the Severn barrage, continued to receive attention, but its development was postponed mainly because of the very high capital cost—around £60 million for the 800 megawatts of generating capacity.

Interest in the practicability of large scale generation of electricity by wind power was increased by encouraging results from research work in both Great Britain and France. The North of Scotland Hydro-Electric board placed a contract for a 100 kw. experimental wind-driven generator to be erected at Ebrington in Orkney in 1950, and the British Electricity authority also invited tenders for a similar plant.

The utilization of water power resources often involves the transmission of power over several hundred miles to the centre of the load. Hence much attention continued to be given to extra-high-tension transmission at voltages up to 400 kilovolts. Sweden's decision to harness the largest waterfall in the country, at Harspranget, 600 m. north of the industrial districts, led to the planning of a 380 kw. alternating current transmission system. This was under construction and was designed so that it could later operate at 400 kw. connected to a European network of that voltage linking the Ruhr and other industrial areas with Austrian and Swiss water power stations. The possibilities of high-tension direct-current transmission for large blocks of power to be carried over long distances—300 m. and over—were discussed particularly in connection with such projects as transmission by under-water cables from Norway to Denmark or Great Britain.

Great Britain. After its first year of operation, beginning on April 1, 1948, the British Electricity authority had completed its organization. Good progress was made both in its power production programme and with distribution, though that in rural electrification was likely to be retarded by the government's autumn cuts in capital expenditure.

The total installed generating capacity (at the end of September) of the B.E.A. and North of Scotland Hydro-Electric board together was 13,564 megawatts, and the peak load carried during the winter 1948/49 was 10,163 Mw. During the first year of operation (April 1948 to March 1949) the number of units sent out was 44,784 million, an increase of 10.5% on the total for the preceding year. The number of consumers was estimated to be 12,300,000. Plans for new generating capacity to be installed by the B.E.A., up to and including 1952, covered a total of 5,518 Mw. Hydro-electric development in north Wales, including six major schemes to
cost approximately £20 million and with an estimated annual production of some 500 million units, were approved in principle.

The annual report of the Electricity board for Northern Ireland showed that in 1948 the number of units sold rose to 179,830,000, an increase of 28% over the preceding year, and the number of consumers to 83,066, an increase of 6,690.

North of Scotland Hydro-Electric Board. In Dec. 1948, the first two hydro-electric schemes of the board, one at Morar, Inverness-shire, and the other at Lochalsh, Ross-shire, were brought into operation. Twelve hydro-electric stations, to have a total capacity of 423,000 kw., were under construction. Nineteen projects totalling 630,000 kw. capacity and with an annual output of nearly 1,700 million units, published in 1948, were confirmed. The aggregate capacity of hydro-electric schemes being surveyed, promoted or constructed was 800,000 kw. with an estimated annual output of 2,200 million units.

A population of 45,000 was given electricity supplies for the first time during 1948, and the total population being supplied was approximately 700,000. The capacity of installed plant being operated by the board at the beginning of 1949 was 250,548 kw., which included hydro, steam and diesel plant. A "highland grid" was to be constructed to interconnect the main generating stations. This would require about 1,000 mi. of 132,000 volt transmission lines. Between April 1 and Dec. 31, 1948 electrical energy amounting to 79,085,200 units was exported to the British Electricity authority's grid in central Scotland. The board sponsored, or co-operated in, research on the design of dams, on wind power for electricity generation and on control of the growth factors of brown trout. The last research, in conjunction with the Department of the Secretary of State for Scotland, was aimed at improvement of angling in Scottish waters.

Commonwealth. The Hydro-Electric Power commission of Ontario completed 27,000 h.p. emergency steam plant at Toronto and erected some 5,000 mi. of new rural lines with connection of about 40,000 new consumers. Co-operation, through a joint Power board, between Ontario and Manitoba had been planned to facilitate future exchanges of power between the two provinces. The Pine Portage scheme on the Nipigon river was being completed at 80,000 h.p. with provisions for further development to double this amount. The Spray lakes hydro-electric project near Calgary having a capacity of 160,000 kw. was expected to be in operation in the autumn of 1950.

In Australia, work on the first dam of the largest hydro-electric project in the country—the Snowy river scheme—was inaugurated on Oct. 17. Two major schemes in Victoria, the Kiewa hydro-electric scheme and the Yallourn brown coal project, made progress. The possibility of the development and transmission of up to one million h.p. from the water power resources of Tasmania to supply the mainland was under consideration.

In spite of great progress in hydro-electric development, New Zealand was experiencing a serious shortage of power. Some 92% of the homes in the country were being supplied, and the unchecked natural increase in demand would be 9% a year. New projects under construction would add 650,000 kw. of capacity.

The South African Electricity Supply commission faced heavy demands by the gold mining industry. The total capacity of plant being installed or on order was 487,000 kw. A contract for the Owen falls project on Lake Victoria was placed by the Uganda Electricity board. It would have an ultimate capacity of 150,000 kw., costing £67 per kw. and would form a basis for great industrial development in Uganda.

Total public supply generating capacity in India was 1,4 million kw., which produced 4,575 million units in 1948. The construction of several additional large steam-driven power stations and hydro schemes was planned.

The Federation government, Malaya, passed an Electricity bill establishing a Central Electricity board but it was decided that existing commercial supply undertakings should not be compulsorily acquired.

Europe. Under the European Recovery programme an international programme of power station construction and interconnection had been planned for western European countries. This covered the building of a total capacity of 2,800 Mw. to produce 7,700 million units annually, including 13 hydro-electric projects in Austria, France, Italy, Switzerland and the Benelux countries. A complementary programme included national projects requiring external financial assistance. The total planned capacity under the two programmes was 7,800 Mw., which was in addition to the national projects for 15,000 Mw. The largest increases in net generating capacity during the next five years were to be: Great Britain (6,600 Mw.); France (2,690 Mw.); Italy (2,971 Mw.); and the bizon of Western Germany (3,000 Mw.). The greatest percentage increase was for Greece, where the capacity was to rise from 156 Mw. in 1948 to 619 Mw. in 1953.

Before World War II, 220-kv. lines running from eastern Germany to Austria and Italy allowed power to pass northwards when there was ample hydro power in the south and southwards from German thermal plant during the winter, when the water flow was small. Removal of generating plant in eastern Germany after the war upset this transfer, but it was to be re-established by the construction of an east-west line in western Germany. The 220-kv. lines would later be converted to an operating voltage of 400 kilovolts.

Developments planned for Italy included the construction of a transmission line 1,200 km. long from the Alps to Sicily and an increase in geo-thermic generating capacity from 125 Mw. to 375 Mw. by 1953.

Finland, which in the peace treaties had to cede about a quarter of her established water power, was making great
efforts towards postwar recovery by completing several stations under construction and by building 11 new hydro-electric stations. The first of these went into operation in 1948, and by 1952 all of them would be completed, raising the hydro-electric generating capacity from 440 Mw. to 800 Mw. All the economically usable main water-power resources of Finland, which could provide 10,000 million units annually, would be utilized within the next 20 years.

The potential water power resources capable of development in the Scandinavian countries was recently estimated, in terms of annual energy production, as follows: Norway 120,000 million units a year; Sweden 50,000 million; Finland 10,000 million. It was probable that Norway would be able in future to export power, particularly to Denmark and Finland, when high-tension direct-current transmission would have become further developed. (E. W. G.)

United States. The U.S. electrical industry was nearing or had passed its peak in 1949. Energy produced for the public supply exceeded the output for 1948 by only 2.9%, as compared with a 10.1% increase the previous year. Total output was 290,783 million kwh., as compared with 282,698 million kwh. in 1948. To generate this output in 1949, the average kilowatt of hydro capacity produced at maximum capacity for more than 63 hr. out of every 100, while steam capacity produced for about 54 hr. out of every 100. Of the output increase of 8,085 million kwh. in 1949, 6,815 million kwh. were furnished by hydro power plants.

The net increase in generating capacity in 1949 up to Nov. 1 was 4,606,000 kw., bringing the total capacity up to 61,166,000 kw. The reported new capacity installed in 1949 was 6,750,000 kw. Preliminary figures set the peak load at 54,300,000 kw. and indicated that the margin of safety would be about 12% or double that of 1948. (F. J. K.)

ELECTRIC TRANSPORT. Despite considerable financial difficulties in many European countries railway electrification made headway in 1949. Fresh impetus was being given by Marshall aid to restoration and to new conversions, especially in Austria and in Italy. Considered individually, the contribution of each country might be small but a number of the year's achievements was not unimpressive. Electric working must be justified for the most part by its economy, rather than by the improved facilities it can offer and in practically all countries electrification was regarded as a contribution to the development of national resources.

Wholesale destruction during World War II and intensive use of transport equipment under poor maintenance presented an opportunity for re-equipping on a large scale, and forced consideration of a motive power policy for some 30 years ahead. Alternative forms of traction were closely examined and the selection of previously accepted standard systems of electrification reviewed. The French railway administration held the view that despite adherence to the standard 1,500 volts d.c. for main line electrification a 50-cycle single-phase system would be preferable on economic grounds for the conversion of secondary lines. In Great Britain a committee was also reconsidering, in the light of modern developments, the selection, made some 20 years earlier, of 1,500 volts d.c. as the standard system.

Great Britain. In Sept. 1949, the Central line of the London Transport executive was extended from Loughton to Epping (five mi.). This administration placed orders for 90 surface line cars of aluminium alloy in order to obtain comparative data of cost and performance and to secure a saving in energy consumption. A weight reduction of 3.1 tons a car was anticipated. In September, also, the Eastern region's 1,500 volt d.c. suburban electrification from London (Liverpool Street) to Shenfield was begun. Ninety-two three-car multiple unit sets were provided to operate over 23 route and 110 single track mi. An eight-car experimental double decker multiple-unit train was put into service on the Southern region in November.

The working party appointed to review proposals for railway improvement put forward by the Railway (London Plan) committee published its report on railway construction and development advocated in Greater London. The electrification of all remaining steam-operated suburban services radiating from London, except on the Western region, was proposed as far as High Wycombe, Tring, Luton, Hitchin, Bishops Stortford and Shoeburyness. Such services were to be continued diametrically across London in tubes taking full sized rolling stock. An under river freight route via Greenwich of $\frac{5}{2}$ mi. was also included. Additional normal sized tubes (12 ft. in diameter) would be constructed both on new routes and extensions to existing routes. The Bakerloo line extension to Cumberwell Green was already authorized. The total route miles in the tube would be 103 mi. and the estimated cost of £238 million was for constructing and equipping the tube lines only, excluding the electrification of the surface lines.

Austria. Electrification in Austria benefited from Marshall aid. Electric working was introduced in May 1949 on the Attnang-Puchheim-Linz section (34 mi.), bringing the total electrified mileage on the main line between Vienna and Buchs on the Swiss frontier up to 342 mi. The Vienna-Linz section (117 mi.) was still to be converted, though the Salza hydro-electric station, which would eventually supply power to this section, was commissioned during the year. Another hydro station was under construction at Kaprun to supply power for the existing Innsbruck-Bregenz line.

Belgium. The conversion of the Brussels Midi-Linkebeek-Charleroi (35 mi.) route was completed in October. The second Brussels Nord-Schaerbeek-Antwerp line (27 mi.) and the connecting loop Linkebeek-Schaerbeek was in hand. These schemes were allied with the junction railway between Brussels Midi and Brussels Nord on which steady progress was made during the year. Plans provided for through freight working between Antwerp Nord and Monceau, near

One of the new electric trains brought into use on April 13, 1949, for service on Southend pier—over a mile in length.
TRANSPORT

Charleroi, as soon as work in the Brussels area allowed. Bulgaria. One hundred and eighty-six route mi. of line radiating from Sofia were included for electrification in the five years 1949-53. The first two for conversion were Sofia-Plovdiv (107 mi.) and Sofia-Mazedra (55 mi.) with an estimated annual consumption of 150 million units.

France. Despite financial difficulties work on the Paris-Lyon (318 mi.) electrification was proceeding steadily. This was one of the most heavily loaded sections of the French railways and the annual consumption between Paris-Dijon would be 250 million units, with a further 150 million units from Dijon to Lyons. The bulk of this power would be produced in the Géniissiat hydro-electric plant. Tests of a new C₄₀C₄₀ 4,000-h.p. express locomotive were remarkably successful. It was the first French locomotive with total adhesion having two three-axle motor bogies. The traction motors were entirely suspended from each bogie frame and drove the wheels through hollow shafts. On a test run between Paris and Bordeaux (362 mi.) a maximum speed of 105-6 m.p.h. was reached with an average of 81-4 m.p.h. Until the Lyons route was opened locomotives of this type were to be employed on the Paris-Hendaye and Paris-Toulouse routes.

Further progress was made during the year on the possibility of extending electric traction on branch lines on the A.C. single phase system taking power from the industrial network at 50 cycles. Two problems required solution, the development of a satisfactory 50-cycle A.C. traction motor and the avoidance of disturbance to other loads on the industrial distribution system. Orders were placed for three experimental locomotives which would operate either from A.C. or D.C. Two of them would have 50-cycle traction motors fed directly from the line on A.C. sections and through a converter, with a reduced output adequate for station duties when operating on,1,500 volts D.C. at an interchange point. The third locomotive would have 1,500-volt D.C. traction motors supplied either direct from the line on D.C. or through an A.C./D.C. motor generator when working on the single-phase routes. Running trials would be made on the line from Aix-les-Bains via Amney to La Roche-sur-Furon.

Germany. Preliminary studies were made of the heavily loaded railway network in the Ruhr zone and the adjoining Rhine province with a view to electrification. The financial position was probably against any extensive electrification scheme but a start was contemplated on the Cologne-Düsseldorf, Dusseldorf, Hagen and Hamm. To ease traffic working the converter-iron of the link between Stuttgart and Waiblingen was undertaken. This connected the main electrified Stuttgart-Ulm-Munich line with the Stuttgart-Nuremberg and the Aalen routes.

Hungary. Electric working was restored on the Budapest-Hegyeshalom main line between Budapest and Győr (93 mi.). The locomotives on this line operated on the Káden system in which 50-cycle single-phase current was taken from the industrial network and converted to three-phase variable frequency on the locomotive by rotating machinery. New 3,200-h.p. locomotives were delivered by the Ganz works. These had one three-axle and one two-axle bogie, on each axle of which an induction motor was mounted. Five economical running speeds with automatic regeneration on down grades were available. The electrification of the Budapest-Hatvan-Miskolc main line (115 mi.) was planned as part of a five-year programme in which was included an underground railway for Budapest, the first four-mile section to be completed within the five years.

Italy. Marshall aid funds were used to extend the 3,000 volts D.C. system to Genoa Brignole on the Genoa-Rome route. The possibility of converting to D.C. the three-phase line between Genoa and Ventimiglia was also under review.

A short connecting link was to be built between Avellino and Palma-San Gennaro. This would shorten the distance between Naples and Avellino by nine mi. The old route, Poreta-Pistolia, 61 mi. of single track on the Milan-Bologna-Rome line, was re-opened for electric working. As the intermediate sub-stations were not finished, power was supplied from Bologna and Florence and the resultant voltage drop was compensated for by special equipment on the electric locomotives and at certain points along the line. The experiment was of interest in its possible application to other secondary lines planned for electrification.

Netherlands. During May 1949 the electrification of the Netherlands railways from Eindhoven to Maastricht and Heerlen was opened. This section comprised 90 route and 230 track mi. and included the large coal marshalling yard at Susteren. The work was estimated to save about 30% in coal amounting to over 300,000 tons a year and would facilitate the distribution of coal from the Limburg coalfield.

Norway. The abundance of hydro-electric power and the difficult coal problems during the war gave fresh stimulus to electrification and it was planned to convert by steps all steam-worked lines. Approximately 550 mi. were now electrified and further conversions made progress. Electric working on the line between Oslo and Stavanger was to be finished in 1950.

Sweden. The lines from Landskrona to Billberga and Warberg to Boras, a total of 80 mi., were converted during the year. The total length of electrified lines now was 3,500 mi. including 430 mi. of the Göteborg-Gävle railway. These lines carried 85% of the total traffic.

Switzerland. The power supply for the Swiss federal railways was investigated and a scheme was developed to meet the requirements necessitated by new conversion and increased services over the next 10 to 15 years, when complete electrification would be established. Provision would be made for an estimated annual consumption of 970 million units a year. The federal railways' own power stations provided a total of 782 million and private stations 99 million units annually. Prolonged droughts and dry winters had periodically resulted in a shortage of power. Extensions both to railway-owned and private stations were in hand and closer attention was being given to the power supply of the country as a whole.

U.S.S.R. The electrification of the line between Dolginskoe and Nikopol (74-5 mi.) in the coalfields of southern Russia was completed in Nov. 1948, and would now be extended from Nikopol to Zaporozhe. Conversion of the Sukhum-Sochi line (70 mi.) on the northeast coast of the Black sea was proposed and power would be supplied from the large hydro-electric station in the Caucasian mountains near Sukhum. A recent conversion in this area was that of the line between the Black sea port of Poti and Samtredy (28 mi.) which was the junction between the Batum line and the coast line from Tiflis to Tuapse.

Yugoslavia. The electrification of the Sarajevo line (124 mi.) was being converted to standard gauge. Its electrification was projected and power would be taken from the hydro-electric station under construction at Jablanica. Good progress was also made with the building of the Vinodol power station designed to supply current for the electrification of the Rijeka-Zagreb main line.

India. Additional sets of motor car and trailer equipment were under construction in Great Britain for the Bombay suburban lines of the Great Indian Peninsular and the Bombay Baroda and Central Indian railways. There was considerable French activity in seeking building and operating concessions for underground railways in cities abroad. Such a project for Calcutta was approved and the first 11 mi. were scheduled to be completed in 1952. The electrification
electrified lines operating from Philadelphia. The Reading railroad ordered 10 cars for its Philadelphia electrified lines and the Long Island railroad ordered 50 double-deck multiple-unit cars.

Another significant development in heavy electric traction was signalized by the Pennsylvania railroad’s order for four 5,000-h.p. straight electric locomotives operating from an 11,000-v. single-phase a-c. trolley wire. Each of these four new locomotives was to have two cabs. Various running gear arrangements were to be employed. Two of the locomotives were to be equipped with four simple, swing-bolster, two-axle swivel trucks having 48-in. wheels and a loading of 45,000 lb. per axle. One locomotive was to be equipped with six two-axle swivel trucks having 42-in. wheels and a loading of 45,000 lb. per axle. The fourth locomotive was to be equipped with four three-axle swivel trucks having 42-in. wheels and a loading of 45,000 lb. per axle. In each case, all axles were to be motor-driven. (See also RAILWAYS.)

electronics. The science and practice of electronics had become an established part of the field of electrical physics and engineering, and it was therefore to be expected that it was the application and development of existing knowledge rather than any startling new discoveries that characterized progress in 1949. An indication of the widespread interest and development in this field was given by the number of exhibitions and conferences that were held at which electronic operating and measuring apparatus was demonstrated and discussed. There was also a noteworthy number of monographs and textbooks published describing various phases of the subject. On the fundamental scientific side, steady research was in progress with a view to obtaining a better understanding of the structure of materials which might be used for a variety of purposes. The investigation of the properties of various synthetic ferro-magnetic materials was already producing noteworthy economies in the use of cores for coils and transformers for certain purposes; and corresponding research on the properties of semi-conductors was being pursued with great interest.

Other work was concerned with the properties of phosphors and photo-electrically sensitive materials. Some of these resulted in the development of the infra-red image converter tube, by the aid of which an object which emits or reflects invisible infra-red radiation can be seen with the naked eye by the image formed on a fluorescent screen. Such devices were used during World War II for detecting fixed or moving objects which were flood-lit by a source of infra-red radiation; but they were also used for observing objects which are themselves sources of the requisite invisible radiation. The use of optical pyrometric methods at temperatures below visible red heat was made possible with the aid of the image converter tube; and in another sphere, these instruments were used for observing rats in the dark in the course of an investigation of the spread of typhus, and also for studying the behaviour of malaria-bearing mosquitoes in the dark or over water. More elaborate equipment comprising a lead-sulphide cell at the focus of a parabolic mirror was used for detecting ships and aircraft at ranges up to 12 mi. with an accuracy of location better than one-tenth of a degree.

There was much interest in both scientific and industrial fields in the application of electronic methods to automatic computing machines. These were in general of two types, for analogue and digital computing respectively, and each had its own sphere of usefulness. The digital principle with its vast "memory" based on supersonic delay lines, storage on the screen of a cathode ray tube, or on a magnetic drum, had a very wide range of application, very great speed
and could give any desired accuracy. Use of the analogue principle resulted in somewhat lower accuracy and a lower degree of flexibility; but its economy and the relative small size and weight were of value in some fields of application. Although it remained to be seen which of the various forms of each type undergoing development would prove to be the best, it was clear that the larger types of electronic digital computer would open up new fields of pure and applied science; for they would, for the first time, make practicable the solution of problems that would otherwise need a prohibitive time for their calculation.

The high speed and low inertia of an electron stream made the modern electronic valve very suitable for measuring and recording short periods of time, and several instruments were developed which combined robustness with reliability and accuracy of operation. One such instrument, described as an electronic stop-clock, was capable of timing intervals up to 12 sec. to an accuracy of better than one-hundredth of a second. It was in effect a combination of a high-speed mechanical counter and thyratron trigger circuits, a valve oscillator being used as a frequency or time standard. A similar instrument, termed a microsecond counter chronometer, was used for the accurate measurement of speeds such as those of projectiles or aircraft. It consisted essentially of an oscillator whose frequency was accurately controlled, an electronic gate and six electronic decade counters. To use the instrument the gate is shut and all the decades are set to zero. On receipt of a starting pulse, the gate opens and the decades begin to count individual cycles of the oscillator. When a stop pulse is received, the gate shuts leaving an indication on the counters of the time that elapsed between the pulses. With a standard frequency of one megacycle per second, time intervals from one microsecond to one second could be measured to within one part in ten thousand; and by using lower oscillator frequencies, the timing range might be extended as required.

Another instrument using a quartz crystal oscillator as its source was developed and used for rating watches, a microphone being used to pick up the ticks of the watch and record these together with impulses from the standard oscillator on a paper chart driven at a known constant rate from the same oscillator. One of the interesting features of this instrument was that it not only recorded the number of seconds per day the watch was gaining or losing, but it also indicated faults such as an irregularity in the beat or a damaged tooth on the escapement wheel.

Various instruments for measuring the moisture content of loose samples such as grain were available, as was also one for checking the moisture content in timber, which might be undergoing drying or rapid seasoning by an electronic method. A novel application of the latter technique was the production of a high-frequency heater for drying and treating grass in a form most suitable for livestock consumption. The use of dielectric heating ensured that the full nutritive value of the grass was maintained, for it was kept considerably higher in protein and carotin content than grass treated by any other process. Another type of instrument which passed from the stage of experiment to that of industrial use was concerned with such applications as the location of metal in timber for use in saw mills, or the detection of metal particles in food-stuffs and pharmaceutical products. (R. L. S-R.)

United States. A number of developments in the field of electronics, employing adaptations of techniques devised during World War II, were announced in 1949. One of these was an "atomic clock," of which details were published by the National Bureau of Standards, where the new instrument was constructed.

The rotating Earth provides the basic time standard, but from the time of Christiaan Huygens, who first applied it to a practical clock about 1670, the pendulum has been the principal secondary standard of timekeeping. In recent years, however, oscillating crystals of quartz had provided an accurate constant frequency of vibration that might be used to control the operation of clocks. The new device utilized vibrations of atoms in the ammonia molecule. It promised to surpass by one or two orders of magnitude the accuracy of the Earth itself, which is subject to a gradual slowing down from tidal friction as well as sudden irregular variations due to causes that had not been fully explained.

The atomic clock was said to provide a time constancy of 1 part in 10 million (equivalent to about three seconds per year), while it was theoretically capable of 1 part in 1,000 million or even 10,000 million.

A physicist at the Bell Telephone laboratories, Dr. A. V. Hollenberg, described a new method of amplifying radio-frequency signals in a vacuum tube. The experimental device which employed this method was called a "double-stream amplifier." A cylindrical stream of electrons travelled down a tube more than a foot long. This stream was enveloped by another slightly larger stream, travelling in the same direction but more slowly. The two streams passed through a wire helix from which the signal to be amplified was impressed upon them. As the progress of one was inter- action between them, causing amplification of the signal, which was taken out as they passed through another helix at the other end of the tube. Another helical coil, surrounding the tube, guided the two electron streams. The method was particularly suitable for amplifying signals of high frequency, i.e., of short wavelength. The more wavelengths there were in the amplifying region, the greater was the gain.

A method analogous to radar, using reflections of high-frequency sound waves (above the audible range) rather than radio pulses, showed promise of helping surgeons to locate gallstones, or foreign matter such as bullets, shell fragments and glass or wooden splinters in the body, it was announced by Dr. George D. Ludvig of the Naval Research Medical Institute in Washington, D.C. He developed the new technique on an experimental basis in collaboration with the Harrison Department of Research Surgery, at the University of Pennsylvania.

In recent years there had been great interest in methods of recording sound magnetically on wires, tapes and discs, though its applications seemed limited because the only method of making duplicates was by playing back one tape or wire, and re-recording it on another. Marvin Camras, physicist of the Armour Research foundation of the Illinois Institute of Technology, announced to the National Electronics conference a duplicating method which was analogous to contact printing in photography. It worked most satisfactorily, he said, with records on magnetic tape, though satisfactory duplications of wire recordings had been made in his laboratory.

He explained that the master record was made on a tape of high coercive force, that is, one that was not easily harmed by passage through another magnetic field. The blank copy tape, placed in contact with the master, was passed through a high frequency magnetic field, where it became magnetized itself. This was in exact correspondence with the master, which retained its own record. Copying might be done at many times the speed at which the tape was played, and the copy had negligible loss of fidelity. With a tape on which several records were made side by side in parallel lines of magnetization, all channels might be copied at once.

Dr. James D. Cobine, of the General Electric Research laboratory, told a Conference on Gaseous Electronic held in Pittsburgh of an "electronic torch" hot enough to melt tungsten, most refractory of the elements, with a melting point of 3,370°C. By means of a magnetron oscillator, radio
waves with a frequency of 1,000 million cycles per second were produced. These were fed to an antenna, consisting of two concentric metal cylinders, at the end of which a high-frequency arc could be formed. As various gases were fed past the arc, a long jet of flame was produced. Some of these were extremely hot, while others were so cool that the finger was not burned if held in the flame.

Hot flames were produced with a gas like nitrogen, which consisted of molecules made of two atoms. The arc broke them into their constituent atoms, but when they struck a surface they recombined, giving off heat. Helium and argon, however, normally consist only of single atoms. Since they could not be broken and reunited, they yielded a relatively cool flame. The electronic torch was still in the experimental stage, and its commercial possibilities had not been explored.

(J. StO.)

ELIZABETH, PRINCESS, DUCHESS OF EDINBURGH, the heiress-presumptive to the British throne (b. London, April 21, 1926), accompanied the King, Queen and Princess Margaret on a state visit to the Union of South Africa in the early months of 1947. She married Prince Philip, Duke of Edinburgh, on Nov. 20, 1947, and on Nov. 14, 1948, gave birth to a son, Prince Charles Philip Arthur George.

Princess Elizabeth, followed by Prince Philip, arriving at the reception at County hall, Westminster, July 14, 1949, to commemorate the golden jubilee of the London County council.

In March 1949 she visited Edinburgh where Lord Linlithgow, chancellor of the university, bestowed on her the honorary degree of doctor of laws. During the same visit Prince Philip received the freedom of Edinburgh. At the end of April Prince Philip was installed as chancellor of the University of Wales, and Princess Elizabeth received from him the honorary degree of doctor of music. They afterwards toured Merionethshire, the county of the Duke's second title. In May they visited Birmingham. With Prince Philip she paid an official visit to Northern Ireland in May and at Belfast was given the freedom of the city. From June 21 to 24 they visited the Islands of Alderney, Guernsey, Sark and Jersey and in the following week the midlands. At Nottingham they were present at the celebration of the 500th anniversary of the granting of the city's first civic charter by Henry VI and on June 29 the Princess laid the foundation stone of the Portland training college for the disabled, Mansfield. From July 26 to 28 they visited many towns in the west riding of Yorkshire. Princess Elizabeth visited Devon and Cornwall in October and in Plymouth unveiled a stone to mark the beginning of the restoration of St. Andrew's church. On Nov. 20 she flew to Malta where Prince Philip was based while serving in H.M.S. "Chequers." In Malta she attended the re-hallowing service at St. Paul's Anglican cathedral and unveiled new panels on the Malta war memorial.

EL SALVADOR: see SALVADOR, EL.

EMPLOYMENT. At the end of Sept. 1949 the number of persons in civil employment in Great Britain (excluding Northern Ireland) was 22,230,000, as compared with 22,011,000 in January. The number in the armed forces was 746,000, as compared with 808,000. Those in civil employment included 15,122,000 males and 7,108,000 females, as against 15,019,000 and 6,992,000 at the beginning of the year. The numbers unemployed, including those temporarily on furlough, were 375,713 in January and 300,255 in Oct. 1949. The great majority of these were not on any firm's books or were only casually employed: few regularly employed workers were temporarily stopped. The amount of unemployment was low in all cases: it was highest in Wales (3.9%) and Scotland (2.8%) and lowest in the north midland (0.4%) and midland (0.6%) regions. In London it was about 1%. Of the total, only 121,582 had been unemployed for more than eight weeks and of these 20,000 were in Wales and nearly 29,000 in Scotland. The unemployed total was made up of 220,000 males and 80,000 females. The towns outside London with the most unemployment were Liverpool and Glasgow. These figures indicated a continuing situation of full employment except for a few areas in which exceptional unemployment existed on a small scale. These were certain ports and shipbuilding centres and some regions in which the openings for employment were ill-balanced in relation to the available supplies of workers: e.g., coalfields and heavy industry areas with a deficiency of lighter trades. There were indeed a number of industries which were still markedly short of labour, notably coal-mining and textiles.

Shifts of manpower from industry to industry were small. Table I shows employment in the main groups in June 1948 (the earliest date for which figures were available on the revised basis which precluded comparison with earlier periods) and in Sept. 1949. Table II shows the break-up for a number of the most important industries grouped under "Manufacturing" in Table I. It will be seen that the only big shift was towards distribution, which had not yet regained its prewar manpower. Among manufacturing industries, there

| Table I.—Distribution of Manpower in Great Britain (in thousands) |
|-------------------|------------------|
| June 1948 | Sept. 1949 |
| His Majesty's forces | 846 | 746 |
| Agriculture, forestry and fishing | 1,268 | 1,276 |
| Mining and quarrying | 869 | 877 |
| Manufacturing | 8,114 | 8,311 |
| Building and contracting | 1,497 | 1,497 |
| Gas, electricity and water | 296 | 312 |
| Transport and communication | 1,814 | 1,815 |
| Distribution | 2,689 | 2,788 |
| Professional, financial and other services | 3,925 | 3,915 |
| National government administration | 688 | 677 |
| Local government administration | 766 | 782 |
| Unemployed | 282 | 281 |
| Total | 21,926 | 22,230 |
was a decline in shipbuilding, whereas there were significant increases in cotton, boots, other clothing, food, printing, chemicals and the vehicle trades. These changes did not reflect the efforts to shift more manpower into the export trades after the devaluation of sterling.

In a situation of full employment, with many trades in search of additional supplies of suitable labour, mobility was bound to be low; and mobility involving geographical shifts was seriously reduced by the universal housing shortage. In a few industries (coal-mining and agriculture), workers, though free to change jobs within the industry, were prevented from leaving it until the Control of Engagement order was relaxed on Jan. 1, 1950. Elsewhere, movement was practically free, and the government made little use of its power to direct labour into jobs in which it was urgently needed. The employment exchanges attempted to induce workers to go into under-manned occupations; and after devaluation control was strengthened by offering applicants a narrower choice of jobs than previously. There was strong feeling against compulsion except in the last resort; but attention was paid to increasing the inducements to movement by offering improved allowances to meet the costs of moving homes as well as by improved facilities for training in alternative trades.

There were many statements by certain economists that Great Britain was in a state of "overfull" employment and that the only way of restoring adequate mobility was to reduce the number of available jobs by deflationary pressure. This view was strongly combated by the government and by the trade unions, who contended that the shifts required were small and were being brought about at a reasonably satisfactory rate by existing methods. In coal-mining, for example, though the intake of juveniles was admittedly too small, much was done by upgrading of workers to the face to make better use of a reduced labour force; and in both mining and cotton it was difficult to induce a large flow of new entrants in face of the knowledge that within a few years higher mechanization might considerably reduce demand for labour.

Although total shifts between industries were generally fairly small, there was in many occupations a rather high rate of turnover. Where this was analysed, it appeared to be due largely to a "floating" section of about 10 or 15% of the employed labour force, mostly less skilled workers, who moved rapidly from one job to another, often within an industry, whereas the main body of employment was fairly stable. There was naturally a higher rate of turnover among women than among men, largely because more married women continued at work than before but were less regularly available than other workers, and in many instances would accept only part-time employment.

The total working force of Great Britain was fairly stable in 1949. There was a shortage of juveniles, owing to the raising of the school-leaving age to 15 and to increased higher education; but this was met by adjustments of work.

The average age of the labour force was rising, and would continue to rise; and the shortage of workers encouraged many old-age pensioners to remain in employment. The older workers did not appear to be more prone than others to lose their jobs but, when they did, found it harder to enter new employment, especially where a shift of home or trade was involved.

Full employment naturally puts the worker in a strong position, not so much in wage-bargaining through the trade unions (which for national reasons refrain from pressing their advantage) but for picking jobs and standing out against any discipline felt to be unduly hard. One effect of this was a steady, though not very rapid growth of schemes of joint consultation in factories: another was a change in the attitude of foremen and supervisors and in the qualities and training considered needful for supervisory posts. There was also more emphasis on human aspects of management and more recognition of the need for personnel officers and for the training of higher management in the problems of "human relations." In general, however, workers in the factories, as well as the trade unions at higher levels, refrained from pushing their advantages to the full, and loss of production through stoppages of work, official or unofficial, was remarkably small. (See Trade Unions and Wages and Hours.)

So far, it had been unnecessary, except in a few areas, for the government to take special measures for the prevention of either unemployment or under-employment, except by ensuring an absence of deflationary pressures that would satisfy the demands of right-wing economists. The recession in the United States early in 1949 caused some pockets of unemployment to appear in Great Britain; but not on a large scale because there was enough unsatisfied demand in the home and soft currency markets to take up the slack.
A serious American depression would, however, seriously react on the level of British employment because a fall of exports (or a decrease in Marshall Aid) would make it difficult to import the materials on which employment depends.

(G. D. H. C.)

**United States.** The civilian labour force (persons not in the armed forces and available for employment) numbered 63,637,000 in Aug. 1949, a gain of 451,000 over Aug. 1948. The labour force reached its maximum, for the first eight months of 1949, during July, when 63,815,000 workers were available. The unemployment figure in Aug. 1949 was 3,689,000 as compared with 1,941,000 in Aug. 1948.

Males in the civilian labour force numbered 45,163,000 in Aug. 1949 as against 45,215,000 in the same month of 1948. Females numbered 18,474,000 as compared with 17,971,000 in Aug. 1948.

Employees in non-agricultural establishments numbered 43,027,000 in Aug. 1949, a decrease of 1,467,000 from Aug. 1948. During the year there were decreases in every area of non-agricultural employment except finance and government (Table III). In these latter areas there was an increase from 7,275,000 workers to 7,595,000 during the period. The largest decrease occurred in manufacturing, where employment in Aug. 1949 fell to the level of 14,088,000 workers as compared with 15,400,000 in Aug. 1948.

*Estimates include all full- and part-time wage and salaried workers in non-agricultural establishments who worked or received pay during the period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded. These estimates have been carried forward from 1947 benchmark levels.

**Source:** United States Bureau of Statistics, Monthly Labour Review.

Production worker employment decreased in every one of the major manufacturing industries in the United States during the period July 1948 to July 1949.

Pay roll indexes of production workers showed a decrease from July 1949 to May 1949 in all areas except two. They increased in both transportation equipment (except automobiles) and in printing, publishing and allied industries.

The figures beyond May 1949 were not available at the close of 1949, because of extensive revisions being undertaken by the bureau of labour statistics.

**Norway.** The industrial employment index for 1948 (1937=100) averaged 133-3 and averaged 138-1 for the first quarter of 1949. The general employment index was 106-9 on the average in 1948 and 108-5 for the first quarter of 1949.

**South Africa, Union of.** The general employment index (1937=100) averaged 128-6 for 1948 and 130-7 for the first quarter of 1949. The industrial employment index averaged 156-1 for 1948 (1937=100) and 160-9 for the first quarter of 1949.

**South America.** Argentina's index of industrial-employment (1937=100) averaged 146-9 for 1947, which was the latest available figure at the close of 1949. The Chilean industrial employment index (1937=100) averaged 134-0 for 1948.

**Sweden.** The Swedish industrial employment index for 1948 (1937=100) averaged 125-5 and averaged 126-2 for the first quarter of 1949.

**Switzerland.** The industrial employment index for 1948 averaged 135-0 (1937=100).

*(See also Business Review.)*

**ENDOCRINOLOGY.** By far the most notable advance in endocrinology during 1949 was the discovery that rheumatoid arthritis and certain other chronic diseases of
obscure aetiology could be controlled by the administration of one of the steroid hormones of the adrenal cortex or by stimulating the gland to secrete that hormone.

It was known, from previous work with animals, that many types of stress (e.g., cold and heat, noxious drugs and infections, overwork and anoxia) are followed by adrenal cortical hypertrophy and evidences of an increased production of adrenal hormones. This reaction is brought about by the stress stimulus acting in an unknown manner to signal the central nervous system. The signal is then relayed to the anterior pituitary gland causing a release of adrenocorticotropic hormone (ACTH), which is the specific stimulator of the adrenal cortex. Under the influence of a sudden outpouring of ACTH, morphological and chemical changes occur in the adrenal cortex, leading to an increased production of the adrenal steroid hormones. These steroids enable the organism to combat or adjust itself to the stress and to survive. The adrenalecтомized animal, which is unable to carry through the described mechanism, succumbs to environmental or internal stresses which the normal animal can withstand. Hence, this complex system consisting of neuro-pathways and hormonal relays seems to constitute a vital self-corrective or homeostatic mechanism for the adaptation of the living organism to threatening environmental or internal influences, which may otherwise have catastrophic consequences.

The adrenalcorticosteroids which are effective against stress are the group of C₁₁, oestrioids (Compounds A, B, E and F of E. C. Kendall). Because of their important effects on certain aspects of carbohydrate metabolism, they were sometimes called glucocorticoids. But their precise mode of action in facilitating adaptation to stress was not known at the end of 1949. However, H. Selje and others who contributed much of the above knowledge studied the phenomenon of adaptation and reported certain evidence which might indicate the role of the various adrenal cortical steroids. It was postulated that some chronic disorders might be expressions of an inadequate or unbalanced reaction of the adrenal cortex to past or continuing stresses and that certain types of hypertension, vascular disorders and arthritis might be considered to be "diseases of adaptation."

During 1949 it was shown that Compound E or Cortisone and ACTH administration was equally efficacious in suppressing the symptoms and signs of rheumatoid arthritis. ACTH or Cortisone, or both, were also tested in many other acute and chronic disorders such as rheumatic fever, psoriasis, lupus, various allergies, etc. While it was too early to judge accurately, it would seem that the C₁₁ steroids are able to suppress the overt manifestations of many seemingly unrelated diseases. It also appeared that, with the aid of these steroids, the tissues of the body acquire an increased capacity to "resist" pathological changes. (See Arthritis.)

Pituitary. The supply of the protein hormones for experimental and clinical purposes continued to be limited by the fact that they had to be prepared by extraction and purification, from the respective glands removed from the meat-producing animals (bulls, sheep, pigs, etc.). The precise structure of any protein was still almost completely unknown. Synthesis from constituent amino acids seemed beyond immediate possibility. With the exception of thyroxine, the protein hormones do not seem to possess an "active" non-protein group. However, C. H. Li and H. M. Evans showed that a reasonably small peptide, which resulted from enzymatic hydrolysis of purified ACTH, has the full physiological activity of the complete protein. This peptide consists most probably of 6-7 amino acids. If the structural pattern could be determined, it would open up the possibility of a partial synthesis of an ACTH-like substance. The significance of such an event would be great, both from its practical aspect and from its bearing on the relation between chemical structure and physiological function of the other protein hormones.

Pancreas. The intense development of tissue enzyme chemistry had led to the general expectation that hormones which affect the metabolism of foodstuffs would be found to do so by increasing or decreasing rates of particular intermediary reactions. For this reason the location of the action of insulin was looked for in some known enzymatic reaction concerned with glucose phosphorylation or its deposition as glycogen. Despite intensive research in this direction the results were not rewarding in 1949. A somewhat different approach was suggested by the work of R. Levine and others. They observed that insulin lowered the level of galactose in the body fluids when this sugar was given to eviscerated animals from which the kidneys were also removed. Such experimental preparations cannot metabolize galactose, for their tissues do not possess the necessary enzymes. The effect of insulin was, therefore, interpreted to mean that this hormone in some way increased the rate at which galactose entered the cell interior through the cell membrane. It seemed reasonable to assume that the action of insulin on glucose is of the same nature. If this is so, the hormone does not exert an action on any of the enzymes of glucose metabolism but makes glucose more freely available to them. (See also Diabetes; Physiology.) (R.A. L.; S. So.)

**ENGLISH LITERATURE**

*Eastern Approaches,* his remarkable record of personal achievement, included accounts of his diplomatic stay and wanderings in prewar Russia as well as of his mission to Yugoslavia.

The first volume of *The Oxford History of English Art,* a survey to be issued in 11 volumes under the editorship of T. S. R. Boase, president of Magdalen, made a welcome appearance. This volume (V), which appeared out of chronological sequence, was written by Dr. Joan Evans and was devoted to the years 1307-1461. Lectures given during his first year as Slade Professor to the University of Oxford formed the basis of Sir Kenneth Clark's *Landscape into Art,* which was concerned with the development of landscape painting as "the chief artistic creation of the 19th century." Arthur M. Hind issued the second part of his great critical catalogue of *Early Italian Engravings* (the earlier part was published in 1938) and thus completed a task that occupied some 40 years of his life and one that would earn the gratitude of all students of Italian art; and with *Late Saxon and Viking Art,* T. D. Kendrick completed his informative and scholarly two-volume survey of the art of the Anglo-Saxons.

Other learned minds, too, were engaged in revealing the past. O. S. Crawford explored the *Topography of Roman Scotland; North of the Antonine Wall* with an observant eye for country and for history. Early Scottish history in the light of added knowledge during the past 60 years was the subject of a number of essays written by the late Professor H. M. Chadwick, which, prepared and edited by his wife, were published as *Early Scotland,* and Dr. M. Cary surveyed the geography of the Mediterranean lands in relation to ancient history in *The Geographic Background of Greek and Roman History.*

Advances in English historical scholarship induced more and more specialization, so that books tended to concentrate on briefer periods or certain aspects of short periods. But Douglas Jerrold, undeterred by a formidable task and fortified by some years of preparation, produced a one-volume *Introduction to the History of England,* which began with prehistoric man and went down to the loss of Normandy in 1204. Among the specialists, Professor J. E. Neale devoted his great knowledge of the Elizabethan period to a study of *The Elizabethan House of Commons.* Professor Herbert Butterfield, who also published two other important books—one on the relationship of Christianity and history, the other on the origins of science—described in *George III,* *Lord North and the People* how Lord North's ministry, then struggling with the American colonies, reached a particularly critical phase in 1779; and Professor B. Wilkinson issued the first volume of his new documentary *Constitutional History of England,* 1216-1399 which went up to the year 1307.

Two other eminent historians gathered together some important papers. Dr. G. M. Trevelyan issued his *Autobiography and Other Essays,* and Dr. G. F. Gooch's *Studies in German History* collected 12 papers, separate in part and subject, but unified inasmuch as they illustrated the various phases of German history through more than four centuries—from the Reformation to the eve of World War II. Events leading up to the catastrophe were clarified by the publication of several volumes of *Documents on British Foreign Policy, 1919-39,* edited by Professor E. L. Woodward and Rohan Butler, and by Elizabeth Wiskemann's history of the relations between Hitler and Mussolini, *Rome-Berlin Axis.*

An earlier episode in German affairs was recalled by the posthumous publication of *Two Memoirs* by Lord Keynes, for the first of these essays (the other was concerned with beliefs held by himself and some of his friends at the beginning of the century) told the story of Keynes's attempts to persuade the Allied Powers to lift the food blockade on Germany and central Europe which had been prolonged after the Armistice. Dr. Chaim Weizmann, Israel's first president, also had his share in great and sometimes tragic events. His autobiography, *Trial and Error,* was as much the story of Zionism as of his own life.

*Laughter in the Next Room,* the fourth volume of Sir Osbert Sitwell's delightful autobiographical sequence, *Left Hand, Right Hand!* opened with a picture of Armistice night in London in 1918 and then roved over the after-war years, again giving due attention to the diverting oddities of his father's character.

The quirks, oddities and reputations of some of the Victorians received their share of attention from the biographers. There were two interesting portraits of Ruskin—the late Derrick Leon's studious *Ruskin: the Great Victorian* (written before the publication in 1948 of Admiral Sir William James's book on the correspondence relating to the marriage with Effie Gray), and Peter Quennell's admirably lucid and objective *John Ruskin, 1819-1900.* Rossetti, too, was twice presented. Helen Rossetti Angeli's *Dante Gabriel Rossetti* was written in order to remove some misconceptions concerning Rossetti's life and character and his relations with his friends and fellow artists; Professor Oswald Doughty's *A Victorian Romantic: Dante Gabriel Rossetti* was a painstaking study which made plain the complex personality of the poet and artist.

Sir Charles Tennyson used family letters and papers to illumine some obscurities and personal problems in the life of his illustrious grandfather, *Alfred Tennyson;* Hesketh Pearson, encouraged by Bernard Shaw, turned to the character and career of *Dickens,* examining the books and noting what was biographically revealing; Christabel Maxwell, granddaughter of Mrs. Margaret Gatty and niece of Mrs. Juliana Ewing, charmingly portrayed those gifted writers for children against their family background in *Mrs. Gatty and Mrs. Ewing;* and Roger Fulford's *The Prince Consort* emphasized Albert's personal contribution to the increase in the political powers of the crown during the middle years of the 19th century, as well as his interest in his family affairs.

Some of these biographers had access to hitherto unpublished material but few had at their disposal so rich and exciting a hoard as that made available to the Marchesa Origo for her absorbing account of Byron's love affair with Teresa Guiccioli—*The Last Attachment.* These papers included 149 of Byron's love letters, mostly in Italian, to Teresa, some of her answers, her unpublished account of his life in Italy—*Vie de Lord Byron*—and other relevant documents. In contrast Harold Nicolson acknowledged that his life of *Benjamin Constant,* the author of Adolphe and lover of Madame de Stael, contained scarcely any material which had not been published previously, but it was, nevertheless, a balanced, lively portrait which most successfully related the man to his times. Achievement in the political sphere was the central theme of J. Deutscher's documented and balanced biography of *Stalin* which approached the Russian leader as an outstanding figure in contemporary world history, and carefully analysed the nature of his achievement and his place in the history of the revolution. A new volume brought that invaluable work of reference the *Dictionary of National Biography* up to 1940.

Few Englishmen had greater opportunity to know the innermost problems facing Britain's universities than Sir Walter Moberly who, since 1935, was chairman of the University Grants committee. Faced with a breakdown of western values, he claimed in *The Crisis in the University* that it was the responsibility of the universities to give their students a philosophy of life and that, unless our culture was to become wholly secular, that philosophy must be founded on Christian values.

Lord Russell formulated his own philosophy of politics in
the first series of Reith lectures broadcast by the B.B.C. and subsequently issued in book form under the title *Authority and the Individual*. Dr. A. A. Luce compiled a Life of George Berkeley, Bishop of Cloyne, and in addition, edited, in collaboration with Professor T. E. Jessop, the first volume of a series of that genial 18th century philosopher's *Works* which included his *Philosophical Commentaries*, Essay Towards a New Theory of Vision and Theory of Vision Vindicated. Another important philosophical work was M. H. Carré's *Phases of Thought in England* from the days of Bede to the Oxford Hegelians at the end of the 19th century.

The assessment of some familiar literary persons was continued by a band of scholarly critics and essayists. Dr. R. W. Chapman is one of Great Britain's leading authorities on Jane Austen, and his *Jane Austen: Facts and Problems* brought together some researches into various aspects of this peculiarly English novelist's life and work and her method of writing. Jane Austen also figured in *Poets and Story-Tellers*, a book of essays in which Lord David Cecil also gracefully and learnedly discoursed on John Webster, Fanny Burney, Ivan Turgenev, Virginia Woolf and others. Virginia Woolf found another admirable commentator in T. E. Jessop, who in *Virginia Woolf* gave an illuminating interpretation of her method as novelist and critic. Edwin Muir's diverse and discriminating critical gifts were displayed to some purpose in *Essays on Literature and Society*, which ranged from a study of the politics of King Lear to discussions of Friedrich Holderlin, Thomas Hardy and Franz Kafka; and Norman Ault shed some *New Light on Pope* with additional biographical material, facts about his quarrels and much bibliographical information. In *The Common Asphodel* Robert Graves collected his essays on poetry compiled between 1922 and 1949 and allowed the reader a view into the poet's workshop; and the story-teller's and playwright's workshop was partially illumined by Somerset Maugham's *A Writer's Notebook*, a book of jottings—plots for stories, anecdotes, impressions of people and places—culled from 15 stoutish notebooks which he kept over a period of some 50 years.

Novels. Although more than 200 new novels were issued each month, few indeed were works of distinct imagination or deserved to remain long in the memory. Aldous Huxley and George Orwell used their considerable talents to depict a scarifying future. Aldous Huxley's *Ape and Essence* pessimistically portrayed human society after a third world war had wrecked 20th century civilization; George Orwell's vision of society 34 years hence, *Nineteen Eighty-Four*, when Britain had become Airstrip One and the world was imagined as divided into three great states—Oceania, Eurasia and Eastasia—was scarcely more reassuring. Joyce Cary was more concerned with character and emotion in his *A Fearful Joy*, a swiftly paced narrative of a woman's eventful life which again exhibited the author's individual talent for depicting the exuberant and diverting sides of shady characters. H. E. Bates, Charles Morgan, Compton Mackenzie and Eric Linklater were Beaconsed novelists who chose, with varying degrees of success, to stay on more or less familiar ground. H. E. Bates's *The Jucaranda Tree* told of the reactions of a group of characters thrown together by circumstances—a car journey across Burma necessitated by the Japanese invasion of the country; in *The River Line*, in which an American visiting a former English companion on an escape journey during the war reconstructed his experience, Charles Morgan seemed overmuch concerned with the sensibilities of his characters; Compton Mackenzie returned to the Highlands, lairds, ladies and local colour with *Hunting the Fairies*; and Eric Linklater went back to Scotland's early days for a good-humoured frolic about giants, a poet and a princess—*A Spell for Old Bones*.

Rex Warner's allegory, *Men of Stones*, was concerned with the conflict between authority and freedom, and if his presentation of philosophic ideas was more successful than his portrayal of characters or emotions, his study was on the whole convincing enough. Tom Hopkinson chose another familiar theme—political escape from a totalitarian country—for his tale, *The Long Slide*: Malcolm Muggeridge's *Affairs of the Heart* made a deft and high-spirited affair of one literary man's investigations into the emotional entanglements of another (deceased); William Sansom turned from the short story to an impressive full-length study in jealousy, *The Body*. Nigel Balchin's *A Sort of Traitors* had a scientific background, but fell below, in interest and characterization, the standard of his *Small Back Room*; and Jocelyn Brooke's blend of reminiscence and reflection made *A Mine of Serpents* an agreeable and realistic account of a man's life.

Among the women, Elizabeth Bowen and Ivy Compton-Burnett are both the possessors of individual styles and talents. Elizabeth Bowen's *The Heat of the Day* was a story of a wartime love affair, with treason in the background, which brilliantly recreated the atmosphere of London in 1942; and the setting of Ivy Compton-Burnett's *Two Worlds* was a ramshackle country house some 50 years ago, and the main theme the sending to school of two children. Nancy Mitford's *Love in a Cold Climate* was a diverting portrayal of life and behaviour in high society. Emma Smith's *The Far Cry*, which was partly a keenly observed record of a 14-year-old child's travels in India with a pompous parent, suggested that when her natural gifts and ideas were fully integrated, she would produce a really interesting novel.

Among the short story writers Rhys Davies, in the title-piece to a collection called *Boy with a Trumpet*, showed that his gifts were not confined to tales about Wales and Welshmen; and William Plomer's *Four Countries* was a volume worthy of one who confessed the debt that he owed to Guy de Maupassant. (A Cx.)

Poetry. In spite of economic difficulties, 1949 was a year rich in poetry, for it saw the publication of collected poems of several established poets working in full maturity. The position, meanwhile, grew increasingly exacting for young and new poets, for the public refused, one might say almost absolutely, to buy their work. The Arts Council of Great Britain, to whose notice this situation had been brought, was trying to find a way in which it could help, without incurring the accusation of partisanship or selectiveness. Although many publishing houses preferred to put out an infrequent book of verse at a loss rather than be subsidized from official sources, it was agreed amongst all concerned that the public could be made more conscious of what poetry was being written today; and steps were taken to promote public readings, radio readings and other means towards the encouragement of poets.

In spite of these adverse conditions, the poets continued to produce good work. The general impression was that the younger generation, those who began to write during and after World War II, shared in common an outlook and philosophy that turned away from cynicism, the political pre-occupation, the class-bitterness of the 1930s. It was no exaggeration to suggest that a wave of new romanticism was rolling in, carrying hopes, simplicities, revivals of faith in individual effort and personality. It was significant that a first book by a newcomer, A. J. McGeech, should be called *Annus Miraibilis*. From the poetic point of view, that truly describes the year which saw the appearance of Edith Sitwell's own selection of her poetry, including the marvellous, Cassandra-like war poetry that carried her name and fame throughout the English-speaking world. She spoke for the whole womanhood of Great Britain, indeed of the human
race, in those superb, desperate lyrics. Two other women poets produced notable books; Kathleen Raine, in *The Pythoness*, revealing in maturity of style her religious happiness in the face of today's social and moral problems, and Dorothy Una Ratcliffe in *Until the Dawn*, adding a most musical collection of Yorkshire songs to the wealth of English dialect poetry.

The outstanding collection of new poems was *The Labyrinth*, by Edwin Muir. Here was major poetry, simple, subtle, passionate and direct, like that of Edith Sitwell. Muir's former struggle with the time-spirit, once so interruptive of his music, was now resolved, and his new verse was full of serene beauty and charged with all the sadness and clarity which beauty conjures out of the confusions of everyday life. Another collection of new work from the poet laureate, John Masefield, added a characteristic chapter to his famous *Collected Poems: On the Hill* is the vision of a veteran, looking back over the landscape of his life. Darkness is coming down: but the air is clear and the night promises to be full of revelation. Another elder poet, too, was Herbert Palmer, whose *Old Knight* a poem sequence for the present time, was a title which spoke for itself. His prophetic strain was still unimpaired. Edmund Blunden's quiet voice was heard again in *After the Bombing* whose grave and lyrical poems were full of exquisite observation of a timeless countryside. Ronald Bottrell published his fifth book of verses, *The Palisades of Fear*.

Amongst the poets putting out *Collected Poems*, were Louis MacNeice and Laurence Whistler. MacNeice had grown in stature with time, as had Cecil Day Lewis. Here were two poets likely to survive the criticism of succeeding generations. Their work was the direct statement of distinctive personalities, artists who had found the way to a statement in song of the problems of our time, giving universality to their individual reactions. Laurence Whistler was more intimate, more a poet of solitude; but his idiom was one that everybody could recognize. Comparable with him was Clifford Dyment, whose work, now collected, showed a lyrical poet of a Heine-like keenness of touch. Finally, mention must be made of the translation of Dante's *Inferno* by Dorothy L. Sayers. It was remarkable for the way in which it used the original *terzaringa* and caught the speed and single-wave sweep, canto by canto, of the original. It would introduce Dante and the whole mediaeval philosophy of life to a wide circle of readers. (*See also Children's Books; Literary Prizes.*)

**ENTOMOLOGY.** Bee Language. During 1949 a further remarkable chapter was added by Professor K. von Frisch to his account of the bee language. When in 1946 he published the result of his investigations on the mechanics of communication in the honey bee, he described how foraging bees, after discovering a rich source of nectar, inform and recruit other workers by dancing on the sides of the vertical comb. There were two kinds of dance. The "round dance" indicated that the source was within 100 metres of the hive but gave no hint of its direction. On the other hand, the "tail-wagging" dance, performed when the source was further afield, conveyed accurately both the distance and direction of the food. Distance was indicated by the tempo of the dance. Direction-giving was rather more complex. There was a passage in the dance when the bee momentarily pursued a straight course (the "straight run"). Direction of the food, with reference to the sun was found to correspond perfectly with the angular deviation of the straight run from the vertical. The reason for this is that outside the hive the bee uses the sun as a point of reference; but in the darkened hive the light symbol is replaced by gravity which has a similar directional quality.

Further observations led von Frisch to discover that the tail-wagging dance, mentioned above, is also occasionally performed on a horizontal surface, such as an alighting board of the hive, and although the sun is still the reference point, the straight run is made in the direction in which the food lies. But he noticed that direction-giving remained accurate even if the sun was invisible to the bee. All that was needed was a small area of blue sky. Now light from blue sky is known to be polarized according to a definite pattern. Could the bee make use of this kind of "map"? Von Frisch's work left little doubt that it could. In his most striking experiment a polarizing screen was rotated above the dancing bees. The direction of the straight run immediately changed in accordance with the angle of rotation.

**Insect Fuel.** All insects store reserve substances which are drawn upon during periods of intense muscular activity. Using the fruit-fly *Drosophila melanogaster* V. B. Wigglesworth made a detailed study of the reserves, their distribution and utilization during flight. The principal reserve substance was glycogen which was distributed in the fat body, halter knobs and among the indirect flight muscles. Smaller deposits of fat were also present in the fat body. When suspended with their legs out of contact with the substratum the insects could be stimulated to "fly" until they were exhausted—a process taking 4-5 hr. in the mature fly. After a single "flight to exhaustion" all traces of glycogen had disappeared, a total equal to some 8% of the body weight being consumed. On the other hand, the fat deposits were intact. During starvation the picture was otherwise for glycogen and fat were used concurrently. The probable explanation was that during flight fat could not be mobilized with sufficient rapidity to be used as fuel.

The efficiency of different substances as sources of energy was also tested by feeding them to exhausted flies at the tip of a waxed pipette. Glucose completely restored the capacity for sustained flight within the remarkably short time of 30-45 sec. One millihour of a gramme provided fuel for a flight of 6 min. Sucrose and maltose restored flight in 1-1½ min.; other, less efficient, substrates restored flight but could not support it continuously.

**Hawaiian Insects.** The indigenous fauna of the Hawaiian archipelago provided many fascinating problems for the student of evolution. As it was fast changing or becoming extinct under the impact of new continental species introduced by man, the publication of E. C. Zimmerman's *Insects of Hawaii* was particularly welcome. These volcanic islands, of early Pleistocene origin, are so isolated geographically that immigration must have been exceedingly rare. This is reflected in the fauna, for out of 33 orders 21 are unrepresented; among the absentees are some parasites (the sucking lice), most insects with aquatic larvae (stoneflies, mayflies) and several orders containing small, fragile insects.

Many insect immigrants which became established evidently found little or no competition from predators and parasites. Thus the large number of flightless insects have clearly been evolved in an environment where flightlessness was not necessarily a disadvantage. With the very small breeding populations favouring the spread of new inheritable characters, many groups have undergone an astonishing radiation. For example, the cosmopolitan genus of plant-feeding bugs *Nysius* contained a variety of endemic species more widely diverse than the entire *Nysius* fauna of the rest of the world. With many ecological niches untenanted, new habits had been evolved. An example was the nymph of the unique dragonfly *Megalagrion* which had forsaken the aquatic for a terrestrial environment.

**The Mating Behaviour of Mosquitoes.** In 1876, while
erecting a lighting system in New York, Sir Hiram Maxim noticed that one of his dynamos, which was emitting a constant note, was attracting male mosquitoes in considerable numbers. In 1948 L. M. Roth demonstrated that the male is attracted by the high-pitched hum of the female's wing beat, mating usually taking place in flight. Males of *Aedes aegypti* attempted to "mate" with tuning forks vibrating at frequencies ranging from 100 to 800 cycles per sec. The plume antennae are the "direction finders." An interesting feature is that at emergence the antennal fibrillae lie recumbent along the shaft of the organ and sounds were not perceived until they were erected several hours later. In other species the fibrillae are only held erect during the mating periods. At such times the males often swarm. During the intervening periods of sexual inactivity the note of the female wing beat is ignored.

The *Arthropod Fauna of Soil*. During World War II, G. Salt and F. S. J. Hollick devised a method for rapidly estimating the wireworm populations of pasture land scheduled for ploughing up. Using this technique a census of the arthropod population in a Cambridgeshire meadow yielded numbers equivalent to 1,069 million an acre. In this enormous population minute Collombola and mites were particularly numerous. These authors estimated that the fauna of soil may actually occupy a higher proportion of their total "living space" than do marine organisms—a rather surprising conclusion.

**Insect Egg-Shells.** Spraying schedules take advantage of the fact that many important orchard pests spend the winter on the trees as eggs. Yet surprisingly little was known about the penetration of spray materials into eggs, or about the causes underlying the resistance or susceptibility of different eggs. With these problems in view J. W. L. Beamant made a detailed study of the relatively large egg of the blood-sucking bug *Rhodnius*. The egg-shell proved to be of great morphological complexity, consisting of some seven layers of differing chemical composition. The innermost layer, a thin film of wax, is responsible for rendering the egg waterproof; but it is also one of the important barriers to substances diffusing inwards. The micropyles, through which the sperms enter at fertilization, are the most vulnerable regions; the properties of the materials lining the micropyles determine what classes of liquids can penetrate. Similar problems were examined in North America by E. H. Sifer who used the grasshopper *Melanoplus*. Water exchanges, which are particularly high in por- tion of the egg, are initially impeded and later broken through a further specialized region, the hydropyle. During arrested develop- ment (diapause) a wax is laid down at the hydropyle; when diapause is terminated the wax is in some way broken down and development resumed.

**The Transmission of Swollen Shoot Disease of Cacao.** The alarming spread of this disease during the past few years was threatening the whole economy of the Gold Coast. It was established that the virus is transmitted by mealybugs (Coccidae), and is in this respect unique. The mealybug population is comparatively free from indigenous parasites. The possibilities of biological control—in this case the introduction of a more efficient hymenopterous parasite, that of the coffee mealybug in Kenya—therefore began to be explored. There was a further interesting possibility. The Gold Coast climate did not appear to be ideally suited to the mealybugs which existed there in comparatively small numbers. And even these small populations might perhaps only be main- tained through the constant attentions of ants (Crematogaster) which protect and "farm" the mealybugs for their honeydew. Whether adequate control of the ants would result in an indirect control of the mealybugs was for the future to decide.

**Organo-Phosphorus Insecticides.** A discussion on this rapidly developing subject was held in London under the auspices of the Association of Applied Biologists. The insecticidal properties of certain organo-phosphorus compounds were discovered by Gerhard Schrader in Germany during World War II. One of his materials, tetraethyl pyrophosphate (TEPP) was developed commercially in the United States and Great Britain as a cheap substitute for nicotine in controlling aphids and thrips. Other of Schrader's compounds showed considerable systemic effect; that is, when watered round the roots of plants these substances were absorbed and translocated to the leaves, where they were capable of killing sucking insects. Knowledge of their mode of action was increasing; a recent discovery was that leaves containing absorbed systemic insecticides could kill insects in close contact with them by fungid action alone. (See also *Chemistry.*

(A. D. Ls.)

**ENVOYS:** see Ambassadors and Envoy.

**EPIDEMICS.** No serious disease pandemics occurred in 1949. In the United States there were fewer recorded cases of pernicious (whooping-cough), streptococcal infections, syphilis, bacillary dysentery, salmonellosis, meningococcal meningitis and pneumonia. The rabies epizootic continued to spread in the U.S. but intensive dog vaccination programmes reduced the amount of rabies in dogs and humans, though other animals, particularly foxes, were now becoming largely responsible for the spread of the disease. At the close of 1948 and extending well into 1949 there was an epidemic of jungle yellow fever in Panama, an area from which no human cases of the disease had been reported since 1907. Heroic measures of *Aedes aegypti* eradication and mass immunization of the population resulted in the effective control of the outbreak. The epidemiologic recurrence of this disease in Panama served as a warning that epidemiologists should remain alert to the danger of the reintroduction of yellow fever into many areas long free of recognized human infection. Influenza which appeared in Sardinia in Oct. 1948 spread to Italy, France, Austria, Bulgaria and the Netherlands by Jan. 1949, and later to the U.S. This outbreak provided the first test of the World Health organization's Influenza centre, established at London in 1948, and the "listening posts" scattered in laboratories throughout the world. The centre recommended that throat washings and acute and convales- cent phase serum from influenza cases be submitted to approved laboratories for determination of the strain of virus involved. On Jan. 12, the centre announced identification by the Institut Pasteur of a virus belonging to the A Group as the cause of half of the cases in France. The centre was informed of the isolation of a similar virus from the southern area of the Netherlands and later the strain was discovered in the United States. The virus was shown to be related to the A prime or FM1 strain epidemic in Europe and the United States during 1947. During the 1947 pandemic, it became apparent that the stock vaccines then available, containing influenza virus A and B, failed to be protective. Subsequently, the FM1 strain was added to all influenza vaccines; however, it was realized that antigenically different strains might appear from time
to time, so that ideally it would be best to immunize the threatened population with the current epidemic strain. This was done in at least one area in 1949. In this episode, only ten days were required for the production of vaccine following the receipt by the laboratory of the throat washing containing the epidemic strain. During the pandemic of 1949, the prevalent influenza disease was mild, with few casualties. The success in securing speedy notification of the strain organized by the World Health organization was encouraging. (See also BACTERIOLOGY; ENTOMOLOGY.)

ERITREA: see ITALIAN COLONIAL EMPIRE.

ESTONIA. From Feb. 24, 1918, to Aug. 6, 1940, when it was annexed by the U.S.S.R., Estonia was an independent republic. The British, U.S. and many other governments, however, had not granted de jure recognition to this annexation. Area: 18,357 sq. mi. Pop.: (Jan. 1939 est.) 1,134,000, (Jan. 1946 est.) 854,000. The reduction is explained by the evacuation of 17,000 Germans in 1939-40, by the Soviet deportation in 1940-41 of 62,000 people, by the fact that about 50,000 Estonians fled to Germany and 30,000 took refuge in Sweden when the Soviet armies returned, and by a second wave of Soviet deportations begun in 1944 (about 12,000 deported up to the end of 1945). Chief towns (1939 est.): Tallinn (cap., pop., 146,400); Tartu (60,100). Chairman of the Supreme Soviet of the Estonian S.S.R., Edvard N. Päll; chairman of the Council of Ministers, Arnold T. Veimer.

History. During 1949 the country came still further under Russian domination and state administration, the Estonian Communist party being permeated by Russians. The party purge begun in 1948 continued. Two deputy prime ministers, Oskar Sepre, ex-chairman of the State Planning commission, and Nikol Andresen were dismissed, the former's place being taken by a Russian, Arseny Leonov. Russians in key positions were Evgeny Radulov, minister of oil-shale industry, A. Sokolov, in charge of collectivization, and A. N. Bezukroev, in charge of agricultural production. N. G. Karotamm, first secretary general of the Estonian Communist party, was a Russified Estonian, but the second secretary, V. Kedrov, was a Russian.

The total population of Estonia was estimated by mid-1949 at 1·3 million. This increase, however, meant both an absolute and a relative decrease of the native population. The influx of Russians was particularly important in Owns. For instance, in Tallinn a total population of 165,000 included 70,000 Russians. A new mass deportation of about 40,000 people took place in the first half of 1949. In August Major General Boris G. Kunn, minister of state security, and Major General Alexander J. Rezev, minister of home affairs, were awarded the Order of the Red Banner for the successful execution of a special assignment of the government of the U.S.S.R. (see also LATVIA; LITHUANIA). At the beginning of 1949 about 85% of the party members were civil servants, 8% workers and 4% peasants, but as the forcible collectivization, which had been inaugurated in Aug. 1947, increased the grip of the party on the countryside, this disproportion was possibly reduced. In July 1948 there were only 50 collective farms in Estonia; on Sept. 16, 1946, A. T. Veimer announced in Izvestia that their number was 2,975 embracing four-fifths of the arable land.

Päll proclaimed on July 21, 1949, that industrial production was double what it had been in 1939—no small achievement in a country where by 1944 war destruction had reduced the industrial production capacity to one-seventh. It had also been earlier announced that the volume of oil-shale production in 1948 was double the prewar yield. That would bring the production of oil-shale to 3·4 million and of oil to 358,000 metric tons: the respective targets for 1950, however, were 8·4 and 1 million tons.

According to N. G. Karotamm, 1·8 million sq. m., or 48% of the total housing space, had been destroyed during World War II. The construction target for 1950 was 1·1 million sq. m., which meant that a population increased by one-seventh was to be housed in a space reduced to four-fifths of that of 1939.

By mid-1949 the number of Lutheran clergymen had been reduced from 170 (in 1939) to 40. The Lutheran bishop August Pahn was deported.

Education. Total number of pupils in elementary and secondary schools in 1949 was 156,000, including 24,543 members of the All-Union League of Communist Youth (Komsomol). The University of Tartu had in 1949 a staff of 450 professors and lecturers, while the students, more than half of whom were women, numbered 2,700.

ETCHING: see DRAWING AND ENGRAVING.

ETHIOPIA. An independent empire of northeastern Africa bounded on the north by Italian Eritrea (from 1941 under British military administration), on the west by the Anglo-Egyptian Sudan, on the south by Kenya, on the southeast by Italian Somaliland (from 1941 under British military administration), and on the east by British and French Somaliland. Area: c. 350,000 sq. mi. Pop. (est. Dec. 1948): 8 million, but the ruling race, the Amhara, numbers about 2 million. Languages: Amharic, the official language; also Tigrinya, Tigré, Galla, Somali, etc.; percentages uncertain. Religions: Christian (Alexandrine) 57%; Moslem 17%; pagan, etc., 26%. Chief towns: Addis Ababa (cap., c. 250,000); Harar (c. 45,000); Dessie (c. 35,000); Dire-Dawa (c. 30,000). Ruler, Emperor Haile Selassie I (q.v.); prime minister, Bitwaddl Makonnen Endalkachaw (q.v.); minister of foreign affairs, Abe Wold Aklilou.

History. Throughout 1949 the political atmosphere was clouded by the continued failure of the United Nations to effect disposal of the ex-Italian colonies: postponement of the Eritrean question at both the spring and autumn sessions was received with a somewhat cynical resignation—the similarity of Lake Success to the Amharic word lekeskes, meaning "confusion," was remarked. Ethiopia's claim for the surrender as war criminals of Marshal Pietro Badoglio and Rodolfo Graziani also proved abortive, since Italy rejected its note and no other powers were disposed to press the matter, despite the publication of impressive evidence in the form of Italian orders and telegrams dating from the period of war and occupation. Ethiopia continued participation in other U.N. activities and was the first state to ratify the Genocide convention.

Individual foreign relations were developed by the raising to embassy status of three Addis Ababa legations—those of Great Britain, U.S. and France—with reciprocal action by Ethiopia in the three capitals concerned. In May Ethiopian ministers were accredited to India and to Norway; and diplomatic exchanges with certain South American states were foreshadowed. Delegates from the Imam of Yemen were received during the year.

Internal politics were strengthened in two directions: in January the marriage took place between Princess Aida, grand-daughter of the Emperor, and Dejazmach Mangasha, son of Ras Siyum, hereditary prince of Tigré, two royal houses being thus united; and in July there was a considerable re-shuffle of ministerial posts, most of the ministries being now provided with both a minister and a deputy minister. Public security remained good; foreign reports of
a "revolt" during the summer, including an alleged attack on the Crown Prince, were tendentious exaggerations of an insignificant local disturbance.

Events of economic importance—though potential rather than actual—were the "spudding-in" of the first oil well in Ogaden in May; preparations for extensive cotton-growing, in an attempt to reduce imports of cotton goods, always a heavy drain on Ethiopian economy; and the start of inoculation of stock, on a large scale, against rinderpest and other cattle diseases, this with the assistance of F.A.O. experts. In the financial sphere, a settlement of outstanding Lend-lease accounts was announced in May. The Ethiopian dollar was not devalued in line with sterling; some concern was felt in commercial circles but the economic reaction could not yet be judged.

Communications were furthered by the opening in April of the rebuilt bridge over the Gibbe on the Jimma road; and in June the foundations were laid of a new bridge over the Blue Nile, on the road connecting Addis Ababa with Gojam. The railway suffered interruption for several weeks in the summer through a strike of workers at Dire-Dawa. Ethiopian Air Lines, besides maintaining all their regular services, inaugurated some new ones to provincial towns in the south. Interest was aroused by visits from foreign aircraft—a Bristol freighter, the new "Scandia" model, and a Dutch-American Convairliner.

In education progress was normal. Of 26 candidates for London matriculation, 13 passed and were sent abroad for higher studies, most as usual to England, where a society of Ethiopian students published its first magazine. The foundation stone of a University of Addis Ababa was laid in November; but immediate developments were not anticipated. Books published in Amharic included first instalments of a revised translation of the Bible; a world history; and Ethiopia and Western Civilization by Kabbada Mika'el, director of the National library. Several new Amharic plays were produced, notably a modern social drama in verse by Kabbada Mika'el and a historical play on the Emperor Theodore by Girmachaw Takla-Hawaryat. A visiting Greek company played "Antigone"; and scenes from Shakespeare were given at the British institute in English by Ethiopian schoolboys.

EUROPEAN RECOVERY PROGRAMME

were given at the British institute in English by Ethiopian schoolboys.

Education. (Est. 1948) Elementary schools 390, pupils 35,000, teachers 1,150; secondary schools 1, pupils 450, teachers 30; technical schools 2, students 250, teachers 15. Illiteracy: 60-65%.

Foreign Trade. (1947) Imports E.569,035,000; exports E.589,430,000.

EUROPE, COUNCIL OF: see COUNCIL OF EUROPE.

EUROPEAN RECOVERY PROGRAMME (E.R.P.), popularly known as the Marshall plan after the former U.S. secretary of state who suggested it, was a scheme whereby the United States, through government grants and loans, assisted a co-operative effort of 18 European states to achieve independence from outside economic aid by 1952.

The programme was inaugurated on July 1, 1948, and 1949 was its first full year. During this year, physical recovery in Europe, which had begun in 1948, continued to make satisfactory progress. At the same time, it became increasingly doubtful whether the aim of the E.R.P.—independence of western Europe from further assistance by 1952—could be reached by the methods adopted.

The participants in the E.R.P. were Austria, Belgium, Denmark, France, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Sweden, Switzerland, Turkey, the United Kingdom and the free territory of Trieste, as well as, originally, the British-American and French occupation zones of Germany, represented by the respective occupation authorities. The place of these was in the closing months of 1949 taken by the German federal republic (Western Germany) so that the total number of E.R.P. countries was 18.

These 18 countries were individually linked with the U.S. through bilateral treaties, in which the U.S. undertook to provide assistance in accordance with the Foreign Assistance act of April 3, 1948, and the European countries promised to make an effort to attain independence from outside assistance within four years by self-help and mutual help.

American aid was administered by the Economic Co-operation administration (E.C.A.), a U.S. government agency headed, under the president, by an administrator, who throughout 1949 was Paul Gray Hoffman. Division of American aid, as well as the stimulation of European mutual help and co-operation, was the task of the Organization for European Economic Co-operation (O.E.E.C.), an international body with its seat in Paris, on whose policy-deciding council all 18 participating countries were represented. In addition, to speed its business, the O.E.E.C. established in Feb. 1949 a ministerial committee of eight member states, which was to act as an "inner cabinet."

For the year July 1, 1948, to June 30, 1949, the U.S. had made available $4,875 million in grants and loans for purposes of the E.R.P. In addition, the European participants had agreed on an intra-European payments scheme, by which European creditor countries passed on part of the dollar aid they received to their debtors in the form of grants (drawing rights) in their own currencies to an extent of $564·7 million altogether, in order to free the flow of intra-European trade.

As a result of all this, the O.E.E.C. was able, in its first annual report on April 16, 1949, to state that "Europe can
look back on a year of progress which could never have been achieved by the efforts of the individual countries alone. Production had generally reached prewar levels (with increases of about 10 million tons in steel production, 31 million tons in coal production and 11 million tons in bread grain production, from the end of 1947 to the end of 1948), and the trade deficit of the 18 countries with the outside world as a whole had been reduced from more than $7,000 million in 1947 to about $5,000 million in 1948. Much of this progress was maintained during 1949.

For the year from July 1, 1949, to June 30, 1950, the U.S. appropriated for E.R.P. purposes $3,628,380,000, as well as a special fund of $150 million which was not to be distributed among the individual participants, but held at the disposition of the E.C.A. administrator to serve as a strategic reserve for the purpose of furthering European economic integration. The sum of $3,628,380,000 was distributed among the 18 participating nations by the O.E.E.C. as follows, 1948-49 figures being shown in comparison:

* Including $37,500,000 for Indonesia

This distribution, based on a report submitted jointly by the chairman of the council of the O.E.E.C., Baron de Nooy (Belgium), and the secretary general, Robert Marjolin (France), was accepted unanimously by the council of the O.E.E.C.; the distribution problem, in fact, proved far less difficult than in the preceding year. At its meeting on Oct. 30, 1949, the council further decided that Marshall aid for 1950-51, whatever its amount, should be divided among member countries in the same ratio as that for 1949-50. It warned member countries to prepare their programmes on the assumption that Marshall aid in 1950-51 would amount to at most 75% and that in 1951-52 it would only be 50% of the 1949-50 sum. The only exception to this reduction would be Greece who could count on the same amount for 1950-51 as for 1949-50 because of the delay inflicted on her recovery by the Communist rebellion.

Far more difficult than the division of Marshall aid was the renewal and modification of the intra-European payments scheme. It was generally recognized that the payments scheme in its 1948-49 shape was a clumsy and unsatisfactory way of dealing with the disequilibrium of trade inside Europe: it put a premium on running trade deficits, was based on speculative advance estimates of future deficits, and kept trade rigidly in bilateral channels. There was agreement that the system had to be made more flexible. But there was disagreement on how that flexibility was to be brought about.

Belgium suggested a scheme by which drawing rights granted by one member country could be used in any member country. To this Great Britain objected that Belgium, whose trade surplus with other member countries was greater than her dollar deficit, would in this way attract most of the drawing rights granted by other member countries, and that in consequence these would lose dollars to her. Britain suggested that while drawing rights might be switched by bilateral arrangements from one debtor country to another, the creditor country in which they could be used should remain unalterable. Liberalization of intra-European trade should be sought rather by a reduction of quantitative import restrictions.

Nearly the whole month of June was spent in negotiations about this question; and a compromise was only reached in the early hours of July 1, the date when the old payments agreement expired. This compromise agreement accepted convertibility of drawing rights in principle but limited it for the year 1949-50 to 25% of the total within an absolute ceiling of $40 million. The particular position of Belgium was, moreover, covered by a complicated special arrangement of which the upshot was that Belgium’s trade surplus with the other member countries, estimated at $400 million in the year 1949-50, was to be covered by drawing rights and conditional dollar aid to the amount of $312.5 million, while for the remaining $87.5 million Belgium was to grant long term loans to its debtors.

On the basis of this agreement, the intra-European payments scheme for 1949-50 was agreed by the council of the O.E.E.C. two months later. The following creditor countries granted drawing rights to their debtors (1949-50, together...
with comparative figures for 1948-49, both figures in dollar equivalents of amounts granted in the respective national currencies):

</table>

Dissatisfaction with the whole conception of the European payments scheme, however, continued and in Dec. 1949 a special working party was set up by the O.E.E.C. to work out a different and more flexible method of dealing with intra-European trade deficits. In the closing days of the year the working group produced the proposal of a European clearing union, to be financed by contributions from the central banks of member countries in their own currencies as well as by the 150 million undistributed dollar pool held by the E.C.A. for E.R.P. purposes. From this fund, credits were to be extended to European debtor countries, allowing them, up to a certain limit, to settle trade deficits arising with other member countries of the O.E.E.C. Beyond that limit, deficits would have to be paid in increasing proportion, and finally to 100% in gold or dollars. The scheme, from which its originators expected a gradual restoration of multilateral trade and currency convertibility among the member countries of the O.E.E.C., awaited the agreement of the governments concerned at the end of the year.

Meanwhile the British proposal to liberalize intra-European trade, by the reduction of quota restrictions on imports, made during the critical negotiations about convertibility of drawing rights in June, had borne fruit in a resolution by the council of the O.E.E.C. of Nov. 2, calling on all member countries to remove 50% of their quantitative import restrictions against one another in the fields of food and feeding stuffs, raw materials and manufactured goods, counted separately, by Dec. 15.

Altogether, the progress made by the E.R.P. countries during 1949 both in physical recovery and in economic co-operation was considerable. Nevertheless, doubts about the possibility of achieving economic equilibrium between western Europe and the U.S. at a tolerable level by 1952 deepened during the year; and the outlook at the end of the year remained uncertain and troubled.

In the opening days of 1949, the O.E.E.C., in a review of the individual four-year programmes of the member countries, was forced to the conclusion that they did not add up to one integrated programme; that the member countries all planned to export more to one another than they were prepared to import from one another; that many of their estimates were over-optimistic; and that, even so, they added up to a remaining over-all deficit of $1,500 million by June 30, 1952, which, on a realistic estimate of probable dollar earnings, was more likely to amount to $2,500 million.

It was hoped early in 1949 to modify and integrate the individual programmes of member countries in response to this criticism and a "plan of action" for 1949-50, adopted by the council of the O.E.E.C. in March 1949, called for measures to this effect. However, pressure of current business and the impact of new difficulties prevented progress in this direction during 1949.

The new difficulties arose mainly from the American business recession, which made itself felt early in the year and reached its peak in the summer months of 1949. Denied by the U.S. politicians as a healthy re-adjustment, this recession nevertheless resulted in a fall in U.S. imports from Europe and European dependencies (and consequently, a fall in European dollar earnings) which was estimated in the Snoy-Marjolin report of Aug. 29 as between $500 million and $600 million during the year. According to the report, this represented about 30% of the estimated dollar earnings of the E.R.P. countries as a whole. "In some cases, there was a decline of 40, 50 and even 60%," the report said. The resulting unforeseen new dollar stringency, which to a noticeable extent nullified the dollar aid received under the E.R.P., made all the E.R.P. countries acutely dollar-conscious and hampered generous schemes for greater integration, which might have implied initial dollar sacrifices for one or the other member country.

Slow progress of European integration in turn provoked an unfavourable political reaction in the United States, where the impression gained ground that Europe was taking the dollars provided under the E.R.P. without taking her obligations of self-help and mutual help sufficiently seriously. At an O.E.E.C. council meeting on Oct. 31, Paul Hoffman called for a "dramatic" rise in European dollar earnings and, simultaneously, for the formation in western Europe "of a single large market within which quantitative restrictions on the movement of goods, monetary barriers to the flow of payments and, eventually, all tariffs are permanently swept away."

A partial response to this speech were the approaches to regional economic unions made in the closing months of the year by France, Italy and Benelux ("Fitalux" or "Finebel"), and by Britain and the three Scandinavian countries ("Uniscan"). In every case, however, the fact
that the economies of the countries concerned (like those of the 18 E.R.P. nations as a whole) were competitive rather than complementary made practical progress exceedingly difficult and it was doubtful at the end of the year whether the attempts to form regional economic unions in western Europe would produce more than some remarkable new essays in nomenclature.

Among those most closely concerned with E.R.P. there were, at the close of 1949, increasing doubts whether the scheme, for all its generosity and its great success in its first year and a half, was not planned on too narrow a basis of time and space to succeed in its aim of re-establishing a permanent equilibrium of international trade. Many European and American economists tended to agree that this aim could only be achieved by extending U.S. foreign aid both beyond 1952 and beyond western Europe, and in particular by making it possible for western Europe to earn dollars through the development of underdeveloped countries.

(S. Hr.)

EVANS, DAME EDITH, English actress (b. London, Feb. 8, 1888), made her first stage appearance in Dec. 1912 as Cressida in Troilus and Cressida. In 1914 she became a member of the Vedrenne and Edie company at the Royalty theatre, London, and in 1918 toured with Ellen Terry in variety theatres. She continued on the London stage and in 1925-26 was with the Old Vic company; in 1931 and 1934 she acted in New York. She also appeared at the Malvern festival. In 1927 she went into joint management with Leon M. Lion at Wyndham's theatre. In plays of William Shakespeare her parts included Nerissa in The Merchant of Venice, Mistress Page in The Merry Wives of Windsor, Helena in A Midsummer Night's Dream and Nurse in Romeo and Juliet; and in plays of George Bernard Shaw she appeared as Lady Utterwood in Heartbreak House, Serpent and She-Ancient in Back to Methuselah and Orintha in The Apple Cart. In Restoration and 18th century comedy her outstanding parts have been Millament, Lady Fidget, Mrs. Sullen, Lady Wishfort and Mrs. Malaprop; and she played Anton Chekhov and Henrik Ibsen. Later appearances were Katerina Ivanovna in Crime and Punishment, Cleopatra in Anthony and Cleopatra and Lady Wishfort in The Way of the World. On March 23, 1949, she opened at Wyndham's theatre as Lady Pitts in Daphne Laureola by James Bridie. In 1948 she acted for the first time in films; first in The Queen of Spades, followed by The Last Days of Dolwyn. In May 1948 she visited Moscow in connection with Moscow's tenth Shakespeare conference and opened an exhibition "Shakespeare on the English Stage." In 1925 she married George Booth (d. 1935) and was created a dame of the British Empire on Jan. 1, 1946.

EVATT, HERBERT VERE, Australian statesman (b. East Maitland, New South Wales, April 30, 1894), was appointed attorney general and minister for external affairs in 1941 and, in 1946, deputy prime minister as well. (For his early career see Britannica Book of the Year 1949.) In Sept. 1948 Evatt was elected president of the United Nations general assembly. In March 1949 he presented his government's case in the banking dispute before the privy council in London (see AUSTRALIA), and in April continued as president of the United Nations general assembly at its resumed meetings at Lake Success. Before returning to Australia he visited Berlin where he saw the airlift in operation. In March the French government presented him with the grand cross of the Legion of Honour for outstanding work in the interests of peace as president of the United Nations general assembly. The general election held on Dec. 10 resulted in a defeat for the Labour government, and he was succeeded as minister for external affairs by P. C. Spender on Dec. 19.

EXCHANGE CONTROL AND EXCHANGE RATES. In 1948 the world shortage of dollar exchange had been progressively reduced by rising production and exports outside the U.S. as well as by more stringent control of imports, but this trend was sharply reversed in the second quarter of 1949. The causes of this change were many and ranged from the reappearance, for the first time since World War II, of a buyers' market for many commodities to the abatement of inflation in the U.S. at a time when significant inflationary pressure still persisted in various other parts of the world. The strain on the gold and dollar resources of the sterling area in particular became acute and on Sept. 18, with the approval of the International Monetary fund, the pound was devalued by 30-52% from 4-03 to 2-80 U.S. dollars.

Changes in the exchange rates of many other currencies followed quickly and by Nov. 15 the International Monetary fund had approved new par values for 14 of its 48 members. Of the others, eight, Austria, China, Finland, Greece, Italy, Poland, Thailand and Uruguay, had not yet established the initial par value of their currencies, while France continued, as in 1948, to be without an agreed par value with the fund. In all these countries except China and Poland, currency adjustments amounting to depreciation against the dollar were undertaken. Similar changes were also made in Argentina, Burma, Ceylon, Ireland, Israel, New Zealand, Portugal, Sweden and Western Germany, which were not members of the International Monetary fund. On the other hand, Switzerland, most of the countries of eastern Europe, central and northern Latin America and several countries of the middle and far east, such as Persia, Pakistan and the Philippine republic, did not allow their currencies to depreciate against the U.S. dollar.

Exchange and import restrictions however, were maintained throughout the year in most countries, with the exception of the U.S., Switzerland and some central American countries. Furthermore, many nations, especially in Latin America, continued to operate multiple exchange rates to control imports and exports. Nevertheless, some progress toward freedom of the exchanges was made, especially in Belgium where the franc was made freely convertible on Nov. 14. In France and Italy the September currency depreciations were accompanied by a substantial unification of the exchange rate structures.

North America. United States. The relatively strong position of the U.S. dollar—and the growing difficulties of
other countries in meeting their dollar requirements—clearly affected the U.S. balance of payments. In the spring of 1949 the rising trend of U.S. imports of goods and services was reversed, as a result both of reduced volume and declining prices. The U.S. surplus on current account (goods and services), which had fallen to $1,205 million in the third quarter of 1948, rose to $1,990 million in the second quarter of 1949. In the third quarter of the year, largely as a result of more stringent restrictions imposed on imports from the U.S. by many countries suffering from a shortage of hard currencies, the surplus was reduced to $1,161 million. In the first nine months of the year, the U.S. current account surplus totalled $4,811 million and despite U.S. government grants and loans of $3,978 million and $563 million respectively, foreign countries had to draw upon gold and short-term dollar assets to the extent of $591 million to finance imports of goods and services from the U.S. This was partly offset, however, by a net inflow of foreign long-term capital into the U.S. amounting to $122 million. Both these figures included net dollar disbursements by the International Monetary fund and the International bank. The remainder of the U.S. surplus was financed by net U.S. private remittances of $412 million and by a net outflow of U.S. private long and short term capital, amounting to $278 million. The means of financing thus exceeded the current account surplus, leaving unidentified transactions of $889 million.

The upward trend of the U.S. gold reserves continued, from $24,398 million at the end of 1948 to $24,771 million at the end of Aug. 1949. After the currency devaluations of September, however, fears of an eventual rise in the price of gold—labelled groundless by U.S. official spokesmen—led some countries to prefer gold to dollar balances and foreign purchases of gold, for example by Italy and the Netherlands, brought the U.S. reserves down to $24,688 million at the end of October.

Canada. On Sept. 20, two days after the devaluation of sterling, the Canadian dollar, which had been at par with the U.S. dollar since July 1946, was devalued by 9.1%. The unofficial buying rate in New York improved from an average of 1-082 per U.S. dollar in January to an average of 1-051 in the two weeks preceding the devaluation of sterling. Thereafter the disparity was practically wiped out for a time, but at the end of the year the free rate was again quoted at a small discount.

The over-riding problem of Canadian trade and payments in the postwar years was to make the traditional surplus with Europe convertible to meet the payments deficit with the U.S. Payment of U.S. dollars by the Economic Co-operation administration for goods shipped to Europe under the European Recovery programme eased the strain; but the vulnerability of Canada's position was clearly shown in the spring of 1949, when a cessation of these "offshore purchases" produced a crisis in Canadian trade. Between the end of March and the end of June the Canadian reserves of gold and U.S. dollars fell from U.S. $1,076 million to $977 million.

Latin America. Although monetary conditions were rather more stable in most Latin American countries than in 1948, a considerable degree of inflationary pressure still persisted. Gold and foreign exchange holdings remained fairly steady for the area as a whole and, unlike most other parts of the world, there were fewer exchange rate adjustments than in 1948; but, whereas some of these countries, however, increased their holdings of gold and foreign exchange, the monetary reserves of others declined or were maintained at about the same level only with the aid of various import and exchange controls. Only Cuba, the Dominican Republic, El Salvador, Guatemala, Haiti, Mexico and Panama operated without exchange controls.

Mexico, after maintaining the rate at between $6.85 and 6.95 pesos per U.S. dollar from Sept. 1948 up till Jan. 1949, allowed it to depreciate gradually in free market operations to about 8.22, and on June 17 a new par value of 8.65 pesos to the U.S. dollar was announced with the approval of the International Monetary fund.

Following the devaluation of sterling four countries made important rate changes. Argentina readjusted her multiple rate structure as from Oct. 3. The preferential selling rate of 3-73 pesos to the U.S. dollar, used for essential imports, was retained but an additional preferential rate of 5.37 was introduced. The basic selling rate, applicable to imports of semi-essentials, was devalued from 4.23 to 6.09 and the free selling rate, for authorized non-trade remittances, from 4.81 to 9.00 pesos to the dollar. Similarly the basic buying rate of 3.35, applicable to import exports, was retained, while new preferential buying rates for "non-regular" exports of 4.83 and 5.73 pesos to the dollar replaced the old preferential rate of 3.98 and a new special buying rate of 7.20 for exports of certain industrial goods replaced the old rate of 5.00. Apart from the new free rate which represented a depreciation of 47% against the dollar, the effect of these changes was in general to devalue the peso by 30.5% against the dollar and, with some significant exceptions, to maintain the old sterling/peso relationship.

In Paraguay new rates established in November effected a substantial devaluation of the guarani against the dollar for most transactions and a considerable simplification of the rate structure. The old official rate of 3.12 guaranies per U.S. dollar was retained for essential imports and three new import and export rates were set up, ranging from 4.92 to 8.05 guaranies to the dollar.

On Nov. 14 Peru announced a new exchange rate system involving the temporary abandonment of the old parity, the adoption of a fluctuating rate and a simplification of the rate structure. Under the new system all trade transactions were conducted at the free certificate rate (which had stood at 16-18 soles per U.S. dollar on Nov. 5), and a free rate without certificates was applicable to non-trade transactions. The system prevailing before Nov. 14 resulted in certificate dollar/ sterling cross rates as low as $1.03 in April but after the devaluation of sterling this disparity practically disappeared.

On Oct. 6 Uruguay introduced a new series of rates. The new system retained the old basic buying and selling rates of 1.52 and 1.90 pesos to the dollar respectively, the former applicable to wool, wheat, meat, and linseed, the latter to general imports amounting to about 75% of the total. Two new buying rates of 1.78 and 2.35 pesos were established for other exports and an additional selling rate of 2.45 for luxury imports.

The Sterling Area. Great Britain. The exchange control system instituted at the outbreak of World War II and placed on a more permanent basis in Great Britain by the Exchange Control act of 1947 was maintained practically unchanged throughout the year. Furthermore, no country entered or left the sterling area in 1949.

In the latter half of 1948, the dollar deficit of the sterling area had been more than covered by E.C.A. assistance and the central reserves of gold and dollars increased from $1,733 million at the end of Sept. 1948 to $1,874 million at the end of March 1949. Nevertheless, the international economic position of Great Britain remained extremely vulnerable. The large prewar net income from investments abroad had not been restored, and government expenditure overseas was still a heavy burden. Various other factors also contributed. The price of gold, an important dollar earner for the overseas sterling area, had remained unchanged in the face of a rise of about 100% in the prices of exports from the dollar area. Furthermore, apart from the South African
Vicky's comment in the "New Chronicle" (London) on the devaluation of the pound by Sir Stafford Cripps on Sept. 18, 1949.

gold loan of £80 million to Great Britain in 1948, which was repaid in sterling in 1949, the gold production of the overseas sterling countries and the proceeds of their exports to the dollar area did not, as in prewar years, yield a net surplus with which Great Britain could cover its deficit with the western hemisphere. Instead, these countries, taken as a group, were now net claimants on the central hard currency reserves rather than net dollar earners, and the surplus Great Britain had with them was largely made up of “unrequited exports” financed by releases from accumulated sterling balances and other capital transfers. In the first nine months sterling releases totalled the equivalent of $830 million and were equal to one-seventh of all Great Britain’s exports.

In the second quarter of 1949, while imports of sterling area countries from the dollar area increased, their exports to that area fell both in price and in volume, and the drain on the central reserves reappeared. The position of sterling was further weakened by the spread of “cheap” sterling transactions in which the pound was traded at rates below $3. In the first half of 1949 the total gold and dollar deficit of the sterling area amounted to $963 million, of which $617 million was on Great Britain’s account and $173 million on the account of the rest of the sterling area. The remaining $173 million, representing payments in gold and dollars to countries outside the dollar area, notably Belgium, Switzerland, Western Germany and Iran, could not be allocated between Great Britain and the other sterling area countries. Since E.C.A. aid ($669 million), drawings by Great Britain on the Canadian credit ($56 million) and by India on the International Monetary Fund ($31.7 million) were insufficient to cover the deficit, the central reserve declined by $206 million.

British Commonwealth. A conference of Commonwealth finance ministers on the subject of the dollar drain was held in July and it was agreed that the necessary steps should be taken to cut imports from the dollar area by 25%. Further measures to alleviate the position of sterling, notably by increased U.S. and Canadian purchases from the British Commonwealth of strategic materials such as tin and rubber and by the broader use of E.C.A. funds for purchases in Canada, were announced after the U.S.-Canadian-British talks held in Washington, D.C., at the beginning of September. The growing opinion that devaluation was imminent, however, led importers in the dollar area both to delay payments and withhold new orders for sterling area products. Finally, with the reserves dropping below $1,400 million, the exchange rate of the pound was reduced by 30-52% from $4.03 to $2.80 on Sept. 18. The new rate was effective in all the British dependent overseas territories except British Honduras. Similar readjustments were made, either simultaneously or in the following days, in the exchange rates of all the other currencies of the sterling area with the exception of Pakistan, which, thanks largely to its exports of jute, maintained a comparatively strong position vis-à-vis the dollar area. On Dec. 31 a new par value of four British Honduras dollars to one British pound was announced with the approval of the International Monetary fund and the previous relationship between the two currencies restored.

Prior to devaluation sterling had been quoted in various financial centres at “free” rates equivalent to substantially less than $3.00. The disparity disappeared with devaluation, but by the end of the year free sterling was again being quoted at discounts exceeding 10%.

Europe. The dollar shortage persisted in most European countries except Switzerland, which continued without foreign exchange control. Thanks to E.C.A. aid and receipts of gold and convertible exchange from countries outside North America, Belgium and Italy, for example, were able to add to their gold and foreign exchange holdings. There was a striking improvement in the monetary position of France and a reappearance of substantial exports from Western Germany.

Within Europe the unbalanced economy of some countries continued to cause difficulties which were, however, mitigated by the European Payments scheme organized in 1948 within the framework of E.R.P. In Sept. 1949 the scheme was renewed with some modifications but it soon appeared likely that the distribution of established drawing rights would have to be revised, since the varying degrees of devaluation appeared likely to improve the balance of trade among the E.R.P. countries and change the net creditor and debtor positions of different countries.

A significant step towards the removal of exchange restrictions was taken in November, when the Belgian Franc was made freely convertible into Swiss francs and U.S. dollars. Discussions also took place concerning the easing of transfer restrictions among various groups of countries, notably France, Italy, and Benelux (Belgium, the Netherlands and Luxembourg), but by the end of the year little had been achieved save some reductions of import quotas.

Austria and Western Germany. The currencies of both occupied countries, Austria and Western Germany, were reduced by a smaller percentage than sterling. On Sept. 19 the West German Deutsche mark was devalued by 20-6% from DM.3.33 to DM.4.2 to the U.S. dollar. Although the official rate of 10 Austrian schillings to the dollar had been in effect since the end of the war, most commercial transactions with Austria had been carried out at premium rates, the premiums varying widely according to the commodities and currencies involved. The official rate was reduced to Sch.14·40 to the U.S. dollar as from Nov. 22, and the system was considerably simplified. All export transactions were to be conducted at an effective export rate of Sch.21·36 to the dollar applicable to luxury imports and non-commercial transactions and the effective export rate applicable to all other imports.

The table shows official parities and rates quoted in foreign centres for sterling and United States dollars immediately before Sept. 18 and on Dec. 28, 1949. Currencies have been classified in three broad groups, A, those which depreciate but to a lesser extent than sterling, B, those which depreciated to approximately the same extent as sterling, and C, those which depreciated by 30% or more. The table is reproduced by permission of the Controller of H.M. Stationery Office.

**Benelux.** The par value of Dutch currency was reduced by 30% 2% to 3 80 florins, or guilders, to the U.S. dollar. In an effort to stimulate exports to the western hemisphere the Netherlands allowed Dutch exporters to retain 10% of their dollar earnings. The Belgian franc, on the other hand, which had been in a relatively strong technical position since the war, remained unaltered, while the French franc showed a slight depreciation.

**France.** Preliminary estimates of the French balance of payments during the first half of 1949 indicated that the French Union deficit with the rest of the world was at an annual rate of roughly $900 million compared with about $1,700 million in 1948. The deficit with the dollar area was probably at an annual rate of about $800 million compared with over $1,000 million in the previous year. Internally, prices were stable or declining during August. The growing strength of the franc reflected this improvement in the internal and external financial position of the country. By April the black market dollar rate had dropped from above Fr.500 at the beginning of the year to about Fr.350. The revision of the exchange rate system of Oct. 1948 was maintained, with minor modifications, up till Sept. 19, 1949. On the basis of this system, non-commercial transactions in U.S. dollars, Swiss francs, Portuguese escudos and, from June 10, 1949, Belgian francs were carried out at the free market exchange rate (which moved slowly upward from Fr. 314.80 to the dollar in January to Fr.330.60 in September), while commercial transactions in these currencies and all transactions in other currencies took place at the average of the free market and the official rate (Fr.214.71 to the dollar).

Following the devaluation of the sterling the franc was devalued on Sept. 20 and the exchange rate system unified. This
adjustment came at a particularly inopportune moment since prices had begun to rise again in August as a result mainly of the summer drought, and concurrently union demands for wages grew. From Sept. 20 all transactions were conducted at the equivalent of the free market rate for the dollar which was initially at Fr.350 but thereafter appreciated slightly. Thus for non-commercial transactions in hard currencies the franc depreciated by only 5·7% in terms of the dollar, while for all other transactions it depreciated by 22·3% in terms of the dollar and appreciated by 11·9% in terms of sterling. The free market rate continued to be controlled by the French monetary authorities.

**Greece.** In Greece the official rate for the drachma of 5,020 to the dollar and the certificate system of exchange rates under which exporters sold foreign exchange certificates to importers in the open market remained in effect. Before the devaluation of the pound sterling exchange certificates were quoted at a level which gave an effective sterling/dollar cross rate of about $3·20 or 79% of the official parity. However, the Bank of Greece announced new certificate rates, to be effective from Sept. 22, (which could be controlled through the issuance of permits for the purchase of foreign exchange) giving effective exchange rates of 15,000 drachmas to the dollar and $2,000 to the pound.

**Italy.** In Italy the system of exchange rates introduced in 1947, and modified on Nov. 26, 1948, to peg sterling quotations to the dollar at the cross rate of $4·03 to the pound sterling continued in effect until the devaluation of sterling. Thereafter the procedure by which exporters sold half their foreign exchange proceeds at the official rate and half at the free rate, while importers carried out all transactions at the free rate, was continued. The official rate was now determined daily, however, by the average of the closing free market quotation in Rome and Milan rather than monthly by the average free rate in these markets for the previous month. Thus a wide differentiation between the official and free rates was hardly possible any more. The lira was then allowed to depreciate from L.575 to about L.628 to the dollar in the free market—which the monetary authorities controlled in much the same way as in France. Thus the lira was depreciated by about 8% in relation to the dollar and appreciated by about 32% in relation to sterling.

**Portugal.** On Sept. 22 Portugal devalued the escudo by 13·1% with respect to the dollar so that its currency appreciated by 25% with respect to sterling.

**Scandinavia.** Denmark, Finland, Norway and Sweden followed sterling and devalued their currencies by 30·5%. Finland was in a somewhat special position. Faced with high domestic costs and declining export prices for pulp and other wood products, its principal exports, it had previously devalued its currency by 15% on July 5. Thus in the latter half of the year the markka lost 41% of its dollar exchange value, falling from 136 to 231 to the dollar.

**Spain.** After the devaluation of sterling the Spanish devalued its basic buying and selling rates of 10·95 and 11·22 pesetas to the dollar respectively, but altered its various special import rates by 30·5% and its special export rates by amounts varying from 7 to 42%.

**Switzerland.** The Swiss franc, alone among western European currencies, was not devalued. With gold and dollar assets exceeding $2,000 million at the end of August, and increasing to such an extent that the monetary authorities had refused to convert dollar assets and adopted a gold sterilization policy to control the inflationary effect of an inflow of foreign exchange, there was no need to change the official parity. However, shortly after sterling devaluation the central bank decided to buy all dollars at the official rate, and the "finance dollar" market, in which the dollar had been quoted at a discount of about 8%, disappeared.

**Eastern Europe.** The exchange rates of Albania, Bulgaria, Czechoslovakia, Hungary, Poland, Rumania, and Yugoslavia, like that of the U.S.S.R., retained unchanged throughout the year. On May 24 the existing exchange rate of 50 Yugoslav dinars to the U.S. dollar was approved by the International Monetary Fund.

**Middle East.** There was little change in exchange control regulations in the middle east in 1949. Besides Iraq—which remained within the sterling area—two former members of that group, Egypt and Israel, followed the British example and devalued their currencies by 30·5%. In both cases the prime motivation for the action lay in the importance of sterling in their foreign exchange assets and in their dependence on the sterling area as a market for their exports. As regards Israel, the devaluation hardly affected imports and financial transactions with hard currency countries since these had been conducted at buying and selling rates of U.S. $3·015 and U.S. $2·986 to the Israeli pound ever since the new state had been established. The other middle eastern countries, Persia, Lebanon, Syria, and Turkey, did not change the par values of their currencies despite the close relations (especially of Persia and Turkey) with sterling and the orientation of much of their trade to countries which did devalue.

**Persia** made some changes in its certificate exchange rate system. From Jan. 16, 1949, three rates were in use. The official rate, 32·5 rials to the U.S. dollar, was applicable to government requirements, imports of sugar, and, from Feb. 13, to non-trade receipts. The Anglo-Iranian Oil company purchased rials for local expenditure at the buying rate of 32·00 to the U.S. dollar. The official plus certificate rate, which declined from 53·88 rials to the dollar in January to 46·19 in October, was used for all other imports except machinery and essential consumers' goods. In addition to rate at the official rate, certificates were issued to exporters and could be sold in the free market to importers or others authorized to buy foreign exchange. After the devaluation of sterling, the certificate rate for the pound dropped to about 112 rials to the pound, giving a dollar/sterling cross rate of U.S. $2·44.

**Syria** and **Lebanon**, with identical monetary units and a common bank of issue, also maintained the existing official par values of their currencies. To encourage exports a regulation was issued, taking effect from Sept. 26, restricting the use of the official rate to 10% of the proceeds of non-trade transactions.

The decision of **Turkey** not to devalue was probably influenced by several factors. The devaluation of sterling considerably reduced the burden of its foreign debt.

**Far East.** China. In May the exchange clearance certificate

![Chart showing the value of the British pound for the years 1929-1949 as compared with the United States dollar and the Swiss franc.](image-url)
EXPLORATION AND DISCOVERY

system was abolished and an exchange deposit certificate system introduced, under which deposit certificates were issued, amounting to 80% of the foreign exchange deposited with the Central bank or appointed banks. These certificates, which also served as import licences, were sold in the open market to those desiring exchange. In a further effort to halt the runaway inflation a new currency unit, the silver yuan, was established. Its exchange value was set at $1.55 to the dollar but was subsequently reduced to $1.45. However, the rapidly deteriorating political and military situation rendered all attempts at monetary and financial stabilization futile.

Thailand. In September a new official rate of 12.5 baht to the dollar and 35 to the pound was established, representing a depreciation of 20.6% against the dollar and an appreciation of 14% in relation to sterling. Exporters of rice, rubber, and tin were required to sell varying portions of their exchange proceeds at the official rate and were allowed to dispose of the remainder in the free market. As regards imports the official rate was applicable almost exclusively to fuel oil. Other payments were made through the free market at 21.22 baht to the dollar. Before the devaluation of the pound free market sterling was quoted at 62 to 66 baht, giving a dollar/sterling cross rate of $2.81 to $3.06. Thereafter, however, the disparity narrowed, the free rate dropping to 57 baht, giving a cross rate of $2.64.

Philippines. The import restrictions imposed toward the end of 1948 did not have the desired effect and, despite U.S. aid estimated at about $200 million, excluding U.S. army and navy expenditures, foreign exchange reserves declined from $400 million at the end of 1948 to $279 million at the end of Sept. 1949. To stop this drain more drastic import controls were introduced at the end of November, and as from Dec. 9 a licence from the Central bank was required for all transactions in gold and foreign exchange.

Japan. On April 25 an official exchange rate of 360 yen to the U.S. dollar was established for all foreign exchange transactions permitted. For important export products such as textiles, this had the effect of devaluing the yen. (See also International Monetary Fund.) (A. Stn.)

EXHIBITIONS: see FAIRS, SHOWS AND EXHIBITIONS.

EXPLORATION AND DISCOVERY. The Antarctic continent, still so largely unknown, continued to be the premier field of exploration (see ANTARCTICA). Ice conditions in the southern summer of 1948-49 were responsible for two major set-backs: the French expedition to Adélie Land, delayed on its voyage south, was unable to effect a landing and returned to Europe—to sail again later in 1949; in Graham Land the leader of the Falkland Islands Dependencies surveys and a sledge party, who were to have returned to Europe from Stonington Island in Jan. 1949, were obliged to winter there another year as their ship was unable to proceed so far south. The Norwegian-British-Swedish expedition sailed for Queen Maud Land in the “Norsk” on Nov. 23.

In Greenland, the Danish Peary Land expedition under Count Eigil Knudt continued its work in the far north. The expedition ship again sailed from Denmark with supplies, and the parties in the field were maintained by means of flying boats, as in previous years. The French expedition to west Greenland under Paul-Emil Victor, sent out in 1948 by the Expéditions Polaires Françaises organization, had a very successful year. In 1948 they had assembled at the edge of the inland ice above Disko sound a considerable concentration of equipment and supplies, including the tracked snow-vehicles “weasels” on which the expedition relied for its ground transport. This operation had involved a formidable programme of road-making and the construction of a telpher cable-way. The members of the expedition, who had returned to France when that task was complete,

The Antarctic exploration ship “John Biscoe” in Admiralty bay with members of the crew of H.M.S. “Sparrow” on board. She returned to England during 1949, and left for the Antarctic on Oct. 11, reaching Port Stanley, Nov. 14, and Deception Island on Dec. 2. were back in Greenland early in the summer of 1949 and, finding their equipment intact, set out for the interior of the ice cap, their destination being the central station occupied for a year by Alfred Wegener’s German expedition 1930-31. This they reached in the middle of July, assisted by supplementary supplies and spare tracks for the weasels, which were parachuted to them from aircraft based on Iceland according to a pre-arranged programme. A new central station was established and a party of eight men remained to winter there and maintain meteorological and glaciological observations. They were to be relieved in the summer of 1950.

The British university expeditions which visited the Arctic in 1949 are mentioned elsewhere in this article. Peter Scott led a small expedition to the Perry river in northern Canada primarily to study the breeding and migration of birds and discovered the only known nesting place of Ross’s Snow Goose. The party travelled from Winnipeg by air and returned in the same way, demonstrating again that much of the Arctic and its fascinating problems are not beyond the reach of those who dwell in the world outside. The same means of access was adopted on an expedition to the coast range of British Columbia led by C. H. Pelham-Burn. He had intended to alight by amphibian plane on Tide lake in this little known mountain land but found that, impounded by a glacier dam, it had largely drained away; and he was obliged to use Bowser lake nearby as his base. The party included a botanist and a surveyor and much new ground was mapped by plane-table and biological collections were obtained.

The year 1949 witnessed a renewed interest in Himalayan travel. An expedition led by Dr. Dillon Ripley and sponsored jointly by the National Geographic society, Yale university and the Smithsonian institute, returned in March 1949 from four months’ travel among the Nepal foothills of the Everest range. They had made extensive biological collections and
secured some remarkable photographs of the Everest group from the southeast, revealing a panorama that had certainly not been photographed before except from the air. Later in the summer H. W. Tilman led an expedition to Nepal. His main object was to climb, but at the instance of the Nepal government the party included a botanist and a geologist and was equipped to make photogrammetric surveys. It had been hoped that by ascending the frontier range the survey photographs would cover a hitherto unmapped region of Tibet. Intervening ridges curtailed the view but material was obtained for extensive revisions to the existing sketch-maps of the Langtang Himal range in Nepal. Bad weather greatly interfered with the climbing programme but two peaks were conquered, the higher, Paldor, being 19,450 ft. high. Extensive biological and geological collections were obtained. There was every reason to hope that the welcome extended to these two expeditions by the Nepalese authorities would encourage further scientific work in the area.

Wilfred Thesiger made a further notable journey in southern Arabia in 1949, through the barren steppes and deserts that lie inland of the Oman mountains. The interior of Oman had remained unvisited by Europeans from 1901 until Thesiger himself crossed a part of the area in 1946 and the preliminary disorder in this part of Arabia had greatly increased the difficulty of travel. Leaving the oasis of Buraimi in the north of Oman in Nov. 1948 with his Arab travelling companions of former years, he was intending to visit the great quicksands of Ummal Samim. In this endeavour the prevailing state of suspicion and disorder served his turn; for the bedawin forbade his party to travel through their territories nearer the mountains and insisted that he should skirt the very quicksands that he wished to see. The Ummal Samim is a depression which retains the infrequent run-off of the Oman mountains, extending from northwest to southeast a distance of 95 mi., and is undoubtedly capable of engulfing man and beast, particularly when the water table beneath the treacherous surface has been raised by recent rain in the mountains. From the Ummal Samim he continued his journey to the southeastern coast of Arabia and returned to Buraimi along the western flank of the Oman mountains. He also traversed the Liwa oasis to the west of Buraimi, unvisited by a European until Thesiger had himself passed through it in 1948. He left England for a further journey in Oman at the end of 1949.

Other expeditions to Arabia were the University of California expedition which was to work in the Hadramaut, Dhofar and possibly in Oman also, its interests being chiefly archeological; and a British party which was to study the breeding places of the locust in northern Oman. Unlike Thesiger these parties were to depend on modern mechanical transport and not on the camel, though this might well limit their radius of action.

As is now usual, a number of summer expeditions from British universities were in the field. The Arctic, relatively accessible from Europe and offering a still unexhausted field for geographical research, attracted most of the attention. A Cambridge geological expedition worked in Spitsbergen, an Oxford expedition in North East Land and a Durham university expedition in Iceland where the unusually wet summer greatly hampered their movements. W. R. B. Battle returned to northeast Greenland, a passenger in the Danish Peary Land expedition's ship, to continue his geologic work of 1948, and succeeded in penetrating to a distance of 500 mi. beneath a glacier, along the bed of a sub-glacial stream, to study the crystalline structure of the ice. A party from Birmingham university worked in northern Norway. Outside the Arctic, two Oxford expeditions went to Africa: one to Mount Kenya principally to study the forest botany of that mountain, and one to Portuguese Guinea to make biological collections. Cambridge parties worked in Algeria and in Spain. A party of over 60 schoolboys made maps in northern Norway.

Noah’s Ark, though fast aground these many years, continued as elusive a ship as the Flying Dutchman and more than one party set out in 1949 to look for her on Mount Ararat.

F. Ge.)

EXPORT-IMPORT BANK OF WASHINGTON. Created in 1934, the bank was made a permanent independent agency of the U.S. government by the Export-Import Bank act of 1945, approved July 31, 1945.

Its purpose is not only to facilitate the financing of U.S. exports but to assist in the financing of development projects in foreign countries which will increase their productive capacity and step up their exports, thereby improving their foreign exchange situation and making them better suppliers of those materials and goods needed for import into the U.S. Its financing is generally limited to the dollar cost of U.S. materials, equipment and services required for development projects in foreign countries.

The bank is empowered to lend to U.S. exporters and importers and to private entities in other countries as well as to foreign governments. It finances specific export and import transactions on application of U.S. exporters and importers where the nature of the risk involved is such that private credit cannot be obtained and when, in the opinion of its board of directors, there exists reasonable assurance of repayment. It also arranges, in favour of foreign purchasers, credits which are available on equal terms to all qualified U.S. exporters for financing the sale of U.S. export staples such as raw cotton.

The total amount of loans authorized by the bank from the time of its establishment in 1934 approximated $4,513 million at the end of 1949. Disbursements during 1949 were approximately $185 million and repayments during 1949 were approximately $144 million. Outstanding loans of the bank totalled $2,179,585,274 at the end of 1949. (S. So.)

EX-SERVICEMEN'S ORGANIZATIONS. In most countries ex-servicemen's associations continued to work for better pensions for the disabled and dependants of the fallen; but in countries under Soviet domination the process of abolishing existing unions by absorbing them in single Communist-led organizations was practically concluded.

Great Britain. British Legion. In Sept. 1949 the membership of the British legion was over a million; there were 5,500 branches, some of them in the British communities abroad, and 3,000 branches of the women's section. The welfare work of the legion was effected through the 4,800 service committees composed of members of the legion, and representatives of kindred bodies, such as S.S.A.F.A. (Soldiers', Sailors' and Airmen's Families association), the Forces Help society, the Red Cross and regimental associations.

These committees dealt with the problems of ex-service men and women, concerning pensions, employment and rehabilitation generally, and some idea of the extent of their work may be gathered from the fact that in 1949 they gave advice and assistance on an average to 3,000 men and women every day.

The legion's main source of income was derived from Poppy day and it acted as a trustee for the Earl Haig fund, which it administered and applied generally for the benefit of all ex-service men and women, whether they were members of the legion or not. Apart from the individual welfare work of the legion, it brought its influence to bear on behalf of all ex-servicemen, wherever their interests might be affected, and its authority to speak on their behalf was clearly recognized by the fact that it was represented on all important advisory
bodies concerned with welfare and rehabilitation. It brought constant pressure to bear upon the Ministry of Pensions in the interests of widows and dependants and those disabled in war, and was successful in obtaining a revision of a number of pension regulations. In the year 1948-49, headquarters and area offices dealt with 28,334 new cases which required negotiation with the Ministry of Pensions, and at appeals tribunals and special courts the legion represented 21,145 cases which had previously been disallowed by the ministry.

The total cost of legion welfare and benevolent services in the year 1948-49 amounted to £1,135,197. Some of the principal items which were included in this expenditure were, relief of temporary needs, help to the permanently incapacitated, maintenance of six country and convalescent homes, weekly allowances for special foods, etc., for those suffering from chronic illness. Money was also spent on assisting ex-servicemen to purchase homes and to start businesses.

The Ministry of Health had already taken over the three legion sanatoria, but the village and rehabilitation centre at Preston hall in Kent remained the property and responsibility of the legion. Although the state had instituted many welfare schemes, there were still many anomalies and cases which no government department had the machinery to handle and it was in this respect that the legion was able to help so many ex-servicemen and women. The operation of these state schemes enabled the legion to concentrate on the more permanent forms of rehabilitation.

Sir Ian Fraser, M.P., and Lieutenant Colonel C. Gordon Larking were re-elected president and national chairman respectively at the British legion annual conference held in May at Yarmouth. (J. C. As)

The Commonwealth. The British Empire Service league, representing over two million ex-servicemen and women throughout the Commonwealth, held its 10th biennial conference at Ottawa, Sept. 11-17. Ex-servicemen organizations, usually called legions, not only from all members of the Commonwealth of Nations and crown colonies but also from the independent republics of Ireland and Burma were represented at the conference which was opened by Field Marshal Viscount Alexander of Tunis, grand patron of the Canadian legion. He emphasized the need for the closest possible co-operation not only between the nations of the Commonwealth but also with the United States of America and other people of good will. He welcomed the presence of representatives of the American legion and the Veterans of Foreign Wars of the United States. In a message to the conference, Earl Mountbatten of Burma, the grand president, who was unable to attend because of his duties, said that a sense of strength, through a real desire for unity, was reflected in the recent adherence to the league of new constituent associations in West Africa and the West Indies.

In a discussion on the attitude of ex-servicemen towards Communism Milton F. Gregg, Canadian minister for veterans' affairs, said that Alexander might be able to produce the greatest bulwark against the inroads of Moscow-inspired unrest in the countries of the Commonwealth. The representatives of the Australian legion submitted a resolution seeking to get all league member-organizations to ask their governments to declare Communist parties illegal. Delegates from British, Canadian, New Zealand and South African legions, while approving the resolution in principle, did not think such representations would serve any useful purpose. The resolution was defeated.

During a debate on migration the conference approved a resolution proposed by the British legion delegation (headed by Lieut. Colonel C. Gordon Larking, chairman, and Lord Cromwell, honorary treasurer) that everything possible should be done to maintain a constant flow of emigrants from the United Kingdom to the various parts of the Commonwealth.

Lieutenant General Sir John Brown was elected chairman of the empire council and Major E. S. Harston re-elected honorary secretary.

Europe. The most active European movement of ex-servicemen and that with the largest membership continued to be that of France. The Union Française des Associations des Combattants (U.F.A.C.) held its general annual assembly in Paris on Feb. 5-6, 1949. It consisted of 48 large and small associations with a total membership of 2,088,889, the largest being the three traditional organizations founded at the end of World War I, the Union Fédérale (391,334 members), the Union Nationale des Combattants (296,007) and the Communist-controlled Association Républicaine des Anciens Combattants (165,385), and the two offshoots of World War II: the Anciens Combattants des Forces Françaises de l'Intérieur (146,779) and the Fédération Nationale des Déportés et Internés (109,376). There were only two important organizations outside the U.F.A.C.: the Association "Rhin et Danube" grouping the ex-servicemen of the 1st French army which landed in the south of France in Aug. 1944, and the Fédération Nationale des Prisonniers de Guerre 1939-45. Between the latter and the U.F.A.C. a difference arose over the conditions under which a carte du combattant should be accorded to ex-servicemen of World War II. The U.F.A.C. protested against the decree of May 4, 1948 fixing the conditions under which a former prisoner of war would qualify for an ex-serviceman's card. The U.F.A.C. held that no one should be accorded a card who did not actually fight at the front for at least 45 days. The government partially yielded to the pressure of the U.F.A.C. and on Dec. 24, 1949, a new decree was published stipulating that a prisoner of war could apply for an ex-serviceman's card if he belonged to a combat unit before or after his capture and if he was detained for a minimum of six months in enemy-occupied territory or 90 days in enemy territory. The point in dispute was both moral and material because only an ex-serviceman with a card was entitled to the retraite du combattant or ex-serviceman's gratuity (see War Pensions). Léon Viala was re-elected chairman of the U.F.A.C.: Maurice de Barral, former secretary general, became one of the four vice-chairmen, and the new secretary general was Albert Morel.

In Poland three Communist-led ex-servicemen's organizations were merged in Warsaw on Sept. 1-2, 1949, in a single Union of Fighters for Freedom and Democracy (Związek Bojowników o Wolność i Demokrację) of which the premier, Józef Cyrankiewicz, became president and General Franciszek Józwiak chairman, both being members of the Politbüro of the United Workers' (Communist) party. The merger convention was considered important enough to invite from Germany Wilhelm Pieck who declared that the Oder-Neisse line was the frontier of peace and collaboration between Poland and the new Germany. Another speaker was Colonel Henri Manhès, a French Communist and chairman of the Fédération Internationale des Anciens Prisonniers Politiques (F.I.A.P.P.), who alleged that the French government was betraying the ideals of the wartime resistance movement. From June 23 the Polish War Disabled union (Związek Inwalidów) had a new president, Tadeusz Cwik, a Communist trade union leader; Colonel Leon Łustacz was re-elected chairman.

In Western Germany an Interessen-Gemeinschaft Ehemaliger Soldaten was created in the autumn. (X.)

United States. During 1949 there was a continued drop in the over-all membership of veterans' organizations in the United States. Approximately 5 million veterans were organized, a drop of 3 million from the 1946 peak. Four-fifths of this membership was in the American legion and Veterans of Foreign Wars.

American Legion. The American Legion had in 1949 about 3 million members. During the year it emphasized
strong support of a broad housing programme aimed at getting more homes at better prices for veterans; continued its drive against Communism by urging repressive legislation and holding seminars for its members concerning the nature of Communism. At its 1949 convention held in Philadelphia, the legion for the first time elected a World War II veteran as National commander, George N. Craig of Brazil, Indiana. The convention adopted resolutions supporting the United Nations, the European Recovery programme and the North Atlantic treaty and advocating a Pacific pact, aid to Nationalist China, universal military training and civil control of atomic energy.

Veterans of Foreign Wars. This organization of 1,130,000 members also elected in 1949 for the first time as its national commander a World War II veteran, Clyde Lewis of Plattsburg, New York. The 1949 programme of the V.F.W. again emphasized support of a federal bonus with a maximum of $4,000.

Disabled American Veterans. Under the leadership of its national commander, General Jonathan Wainwright, the D.A.V. in 1949 increased its membership to 141,361, the largest in its history. Its 1949 convention, held at Cleveland, Ohio, elected David M. Brown of Akron, Ohio, as national commander and once again emphasized the D.A.V. programme of increased aid to disabled veterans and their families.

American Veterans of World War II. The “Amvets” at its 1949 convention held at Des Moines, Iowa, elected as its new national commander Harold Russell, handlestar of the film The Best Years of Our Lives. The two big issues facing the organization during 1949 were a proposed merger between “Amvets” and the other World War II veterans’ organization, the American Veterans’ committee, and a federal bonus for World War II veterans. While a majority of the national leadership were for a merger and against the bonus, rank and file delegates to the convention defeated both proposals.

American Veterans Committee. The membership of this organization dropped to about 30,000 in 1949, but through modified organizational policies it improved its financial position. It again called for a full civil rights programme, support of the European Recovery programme and the North Atlantic treaty and increased housing and health legislation. It opposed a federal bonus.

In addition to the above organizations, numerous other groups were active. Most important of these were the Air Forces association, Army and Navy union, Jewish War Veterans, Catholic War Veterans, Regular Veterans association and Military Order of the Purple Heart. (R. A. B.)

EYE, DISEASES OF THE. Sulphonamides continued to be employed in the treatment of local and systemic eye infections with few serious secondary reactions. That the use of sulphonamides could produce changes in the eye had been demonstrated by the production of slight cloudiness of the aqueous humour and transient myopia. Objective stigmatoscopy showed that in many cases refractive changes toward myopia occurred axially. Since the myopia must depend on a change in the lens it seemed probable—as in diabetics changes of refraction—that this is localized in the nucleus of the lens. The actual pathogenetic mechanism, however, remained obscure; probably the change is in some way allergic.

The increase in the number of diabetics continued, and the number suffering from diabetic retinopathy further increased in comparison. The increase in proliferative retinopathy was particularly pronounced. One-third of the patients with diabetic retinopathy had normal blood pressure (that is, less than 130 mm. of mercury systolic); these were to be found among the younger patients. More than one-fourth of the patients with retinopathy were affected by this before five years had elapsed from the time when the diabetes started. Patients less than 50 years of age when their retinopathy was diagnosed had been affected with diabetes only for a short time; they seemed to be particularly susceptible to retinopathy. The proliferative retinopathy takes longer to develop than the common retinopathy, probably because some of them pass through a non-proliferative preliminary state. Possible reasons for the increasing frequency of diabetic retinopathy are insufficient insulin treatment and the introduction in the 1930s of the free diet.

By the use of a new staining technique (fuchsin-sulphite reagent of Fuelgen) which had become available for the visualization of the blood vessel walls in preparations of the whole unsectioned retina, it was possible to see and determine the nature of small haemorrhagic spots in the retina, seen particularly in diabetes by use of the ophthalmoscope. Flat preparations of the retina in cases of diabetic retinitis showed great numbers of capillary aneurysms. The aneurysms always have both an afferent and an efferent connection and are therefore true aneurysmal dilatations, not endothelialized pseudolesions which would be connected to the vascular tree by a single channel. In some capillaries tiny knuckles can be seen in the walls, possibly representing the first stage of aneurysm formation. The aneurysms are most frequent in the central retinal region but occasionally can be found quite far out in the periphery. Similar capillary aneurysms occasionally are seen in cases of retinal disease in non-diabetics, but they are quite rare. By the technique applied, any cellular component that contains carbohydrate is stained red. By this preparation the internal limiting membrane stains brilliantly, showing that this structure is a definite entity and not a condensation of the vitreous surface, as had sometimes been supposed.

The use of tracer elements in the treatment of diseases of the eye had been proposed since the discovery, by the means of radio-autographs, that the concentration of these elements can be estimated. A series of radio-autographs was made in connection with a comprehensive study of the exchange of phosphate between the blood and the eye. Radioactive phosphorus (P³²) was injected intra-peritoneally into guinea pigs. The animals were killed after an experimental period of one to one and a half hours, whereafter the eyes were frozen and sectioned. The sections were placed in contact with photographic film which was darkened by the radioactive material. The pictures obtained in this manner gave a direct indication of the newly introduced phosphate in the eye at the moment of death.

Granulomatous diseases of the eye, such as tricheliosis, syphilis and tuberculosis were treated with doses of manganese, copper, cobalt, zinc, magnesium and iodine with encouraging results. (W. L. Be.)

EYSKENS, GASTON, Belgian statesman (b. Lierre, April 1, 1905). After qualifying in political and social service at the University of Louvain and Columbia university, New York, he was appointed in 1931 professor of economics and public finance at the former. He entered politics as a Christian Democrat and on April 2, 1939, was elected a member of the Chamber of Deputies; after the liberation he was re-elected on Feb. 17, 1946, and on June 26, 1949, his name was included in the Christian Social party list. He was appointed minister of finance in the first Achille Van Acker cabinet (Feb. 1945-March 1946), and in the two successive Paul-Henri Spaak cabinets (March 1947-Nov. 1948 and
Nov. 1948-Aug. 9, 1949). On Aug. 10, 1949, he formed a coalition government of nine members of the Christian Social party and eight Liberals (see Belgium).

FAEROE ISLANDS (FAERGERNE), a self-governing part of the kingdom of Denmark in the north Atlantic situated between Iceland and the Shetland Islands, about 200 mi. N.W. of the latter. Area: 540 sq. mi.; there are 21 islands, excluding small rocks and reefs, of which 18 are inhabited. Population: (Nov. 5, 1935 census) 25,744; (Dec. 31, 1945 census) 29,198. The capital is Thorshavn, on the island of Strømø (pop., 1945, 4,390). Language: Faeroese, akin to Icelandic rather than to Danish. Religion: Lutheran.

History. The King and Queen of Denmark visited the Faeroes, July 20-24. After the new constitution was brought into force (April 1, 1948) the islands, formerly an amt (county) of Denmark, began to enjoy a large measure of home rule, and a Faero flag was adopted. A member of the Danish Finance committee which visited the Faeroes in Aug. 1949 reported that the Independence party (Sjálvstýrisflokkur) was now more friendly towards Denmark. The islands could not, in fact, support out of their own reserves the Danish system of education, social security and state health service to which they had become accustomed as a Danish province.

The population continued to increase and living standards were comparatively good, but by Feb. 1949 the cost of living index (269) dropped a little from its high point (283) in April 1945 (July 1939 = 100). High costs, especially in wages, and the import levy of 10% on fresh fish landings in the United Kingdom put many trawlers in a difficult position and spurred on attempts to shift the emphasis from a simple fishing economy to a more industrialized state, based on sea fisheries and coal.

Meanwhile, a marked cultural renaissance expressed in poetry and music continued to accompany the movement towards autonomy. The late Petur Peturson's setting of Simun av Skardin's Túalfagra land was adopted as the national anthem.

Education. The Faeroes are included in the educational system of Denmark (q.v.), but whereas Danish was formerly the language of school, church and law, from 1948 teaching was carried on in Faeroese, and the whole bible was made available in the native language, in which literature was reviving on a basis of folk ballads.

Agriculture and Fisheries. On the 2.5% of the land considered cultivable barley, oats and potatoes were grown for the islanders' own use, while plentiful grass and hay supported about 80,000 sheep and 5,000 cattle (1949). In 1930, 7,238 Faeroese were independent fishermen, 654 combining fishing with agriculture or industry. In 1944, 44,484 metric tons of fish were caught worth Kr.45,576,000. Whale-fishing was growing in importance, at the expense of feather-collecting, and, in 1947, 218 finwhales and 1,798 cæsaer-whales were caught.

Industry. Brown coal mined on the mainland sides of Rangárhóll and Kvalbo provided for the island's own needs in fuel; but deposits on Súðuro, estimated at about 100 million tons, remained unexploited through lack of modern machinery. In addition to the existing small shipyard, wool mills, whale oil and herring factories, a new canning industry had been started in Klakavík.

Foreign Trade. On the exhaustion of the Faeroes' sterling balances (April 1948), sterling imports were restricted to essential goods and the islands returned to their traditional markets, selling salt cod and other fish products at high prices to Italy and Spain via Denmark, and buying consumer goods from Italy instead of the U.K. In 1947 exports were (in metric tons): salt fish 21,685 (worth Kr.34,655,000) and dried fish 717 (Kr. 2,152,000), both going largely to Italy. Cotton oil 953 (Kr. 2,950,000) and woollen products 54.4 (Kr.2,041,000), all to Denmark; fresh fish 26,743 (Kr.23 million), all to Great Britain. Imports (1947) were: machines, apparatus and transport material (Kr.5,950,000), more from Denmark than from the U.K.; clothing, hats, shoes, textiles generally (Kr.12,670,000), largely from the U.K.; metal manufactures (Kr.2,587,000), about equally from both countries; dairy products and eggs (Kr.2,275,000), all from Denmark.

Transport and Communications. By 1949 there were 38 Faeroese-owned trawlers (not long before World War II, only one). In 1945, 61 ships (totaling 24,212 NRT) called at the Faeroes, including 32 British. In addition, 455 non-Faeroese fishing-boats put in at Faeroe ports in 1945, including 412 British. During World War II the faeroese fishing fleet was destroyed by enemy action but it was fully re-habilitated. Indeed expanded, by 1949.

Finance and Banking. Soon after the occupation of the islands by British Forces in May 1940, the Faeroes became part of the U.K. When the £3 million wartime accumulation (from sales of fish to the U.K.) had been spent on fishing fleet reconstruction, the islands rejoined the Danish monetary area (Nov. 1948), an Anglo-Danish agreement leaving the Faeroes control over their own sterling earnings, Denmark making sterling available to cover the islands' outstanding debts and direct trade between the Faeroes and the U.K. being permitted to continue. During 1949 it was announced that the Danish National bank would issue special Faeroe currency, the Faeroer krona (at par with the Danish krona) to be covered by Danish kroner deposited in the Danish National bank.

(E. J. L.)

FAGERHOLM, KARL AUGUST, Finnish statesman (b. Sjundeå, Finland, Dec. 12, 1901), was appointed prime minister of a Social Democratic cabinet on July 29, 1948. (For his career see Britannica Book of the Year 1949.)

Replying to an accusation in a Moscow newspaper, he denied at Tampere, on March 6, that there had been any discussion of Finland's engaging in either the North Atlantic treaty or the suggested Scandinavian defence pact. On June 15 the parliament renewed its confidence in his government by a majority of two votes. This was the outcome of the fifth parliamentary attack against Fagerholm staged by the Communist party. On Aug. 22 he said that the series of strikes started by the Communists three days before were the largest and best prepared attack against the community in Finnish history.

FAIRBANKS, DOUGLAS ELTON, Jr., U.S. actor and producer (b. New York city, Dec. 9, 1909), was educated in Pasadena and Los Angeles, California, and New York city, then studied painting and sculpture in New York City. In 1929 he married the actress Joan Crawford, but they were divorced in 1933. In 1939 he married Mary Lee Epling Hartford. A stage and screen actor since 1923, Fairbanks eventually took on some of the swashbuckling roles that had made his father, Douglas Fairbanks, Sr., famous. Among his more famous films were Stella Dallas, Outward Bound, Morning Glory, Angels Over Broadway, Dawn Patrol, Little Caesar and many others. He had appeared on the stage and screen in Great Britain as well as in the U.S., and frequently spent much time in the British Isles.

King Frederik and Queen Ingrid leaving Copenhagen on a visit to the Faeroe Islands, July 1949.
Early in World War II he became national vice-chairman of the Committee to Defend America by Aiding the Allies. He was active in the British War Relief association, 1939-41. Later in 1941 he went to South America as a special envoy of President F. D. Roosevelt, and on returning received a commission in the United States naval reserve. He served in many areas and several engagements and ended the war as a commander in the naval reserve. In March 1949, the British Consulate in Los Angeles announced that the King had appointed Fairbanks an honorary K.B.E. largely in recognition of his work on behalf of Anglo-American friendship and especially as chairman of Co-operative for American Remittances to Europe (C.A.R.E.). Fairbanks was invested by the King on July 12 at Buckingham Palace.

**FAIRS, SHOWS AND EXHIBITIONS.** During 1949 trade fairs and exhibitions in Great Britain attracted more exhibitors, buyers and members of the public than in previous years. The most important of all—the 28th British Industries fair—which as before was held at Olympia and Earls Court, London, and Castle Bromwich, Birmingham—had 3,200 exhibitors. There were 17,061 overseas buyers, 124,555 home buyers and 111,388 public visitors.

British traders supported many trade fairs in Europe. The 53rd Utrecht autumn industrial and agricultural fair had 3,056 exhibitors, of which 324 were British, heading the list of foreign countries. More than 150 manufacturers were represented in the British pavilion at the international fair at Izmir (Smyrna), Turkey. This was the first time the pavilion had been organized by the British chamber of commerce in Turkey. The Board of Trade officially participated in the trade fair at Poznan, Poland, the St. Ériks fair in Stockholm, and at Utrecht.

British trade exhibitions which were held for the first time after World War II included the shoe and leather fair at Olympia; the Smithfield fatstock show, which was organized in conjunction with the agricultural machinery exhibition at Earls Court in December, and the *Sunday Times* national book exhibition at Grosvenor house, London.

The 25th international cycle and motor cycle show was held at Earls Court in October. The world’s largest cycle show, it attracted 177 exhibitors and 189,671 visitors. The international motor exhibition at Earls Court, and “Radiolympia” were held at the same time—“Radiolympia” opening on Sept. 27 and the motor show the following day. An exhibition of underground mining machinery—a new trade show—was held in July, and a business efficiency exhibition in November.

The Scottish industries exhibition was opened at Kelvin hall, Glasgow, on Sept. 1, by the Queen. More than 300 Scottish manufacturers exhibited in the largest trade fair ever held in Scotland. The fair was an outstanding success—544,867 people visited it, including 1,100 overseas buyers. The second international trade fair was opened in Toronto on May 30. There were exhibitors from 32 countries: 130 British firms were represented.

It was noticeable at the trade fairs of Frankfurt and Leipzig that Germany was divided. Of 2,634 exhibits at Frankfurt spring fair in April, only 33 were from Berlin and 11 from the Soviet zone. The Leipzig spring fair in March attracted about 6,000 exhibitors; only 300 were from west Berlin, and under 300 from west Germany. Czechoslovak, Polish and Hungarian industrial exhibitions were held at the Gorky central park of culture and rest in Moscow. Unlike 1948, when only consumer goods were displayed, there were also products of heavy industry in the Czechoslovak exhibition of July 1949.

The Zagreb international fair, which opened on Sept. 17, had exhibitors from many west European countries, but in August the Soviet all-union chamber of commerce was instructed by the Soviet government to refuse to participate. The reason stated was “the recent disclosed facts of brutal treatment by Yugoslav authorities of Soviet citizens.”

The annual show of the Royal Agricultural Society of England was held at Sundorne, Shrewsbury, under the
presidency of Princess Elizabeth. Previous shows at Shrewsbury were in 1845, 1884 and 1914. The showground, which extended to 115 acres, was not big enough for all the livestock entries that were offered. The total number of entries accepted was 4,679. The Great Yorkshire show was held at Wakefield—the first show of the society since 1939. The Royal Lancashire show was at Stanley Park, Blackpool, only the third time since 1768 that the county show had been staged in Blackpool. There were 6,983 entries, over 2,000 more than in 1948.

More than 102,000 persons attended the Royal Welsh Agricultural society's show at Swansea, 23,000 more than the previous record at Carmarthen in 1947. At the Bath and West show at Long Ashton, Bristol, there were 525 trade stands offering evidence of the progress of mechanization in agriculture. The 63rd show of the British Dairy Farmers' association, at Olympia in October, attracted 102,097 visitors—the first time more than 100,000 persons had attended.

The Irish society held its first large postwar show in the Horticultural hall, Westminster, in June. Other shows there included those of the Royal Horticultural society and the National Rose society. The Chelsea flower show was again held in May.

A special exhibition was held in London as part of the Colonial month. Described by the King as "a vivid and convincing portrait of the colonies, their peoples and their problems," the exhibition provided an opportunity for people in Britain to acquire up-to-date information about the colonies with the minimum of effort and study. Because of its popularity—528,433 visitors attended—the exhibition remained open for more than three months, and the Colonial Office considered proposals for arranging similar displays in provincial centres.

History. A new constitution, granted at the end of 1948, came into force on Jan. 1, 1949. It provided for a Legislative Council consisting of the governor as president (with a casting vote only), three ex-officio, three official and two nominated and four elected unofficial members; the council held its inaugural meeting on March 4. The Colonial Development corporation announced that under its auspices a sealing venture had been launched. The Falkland Islands Dependencies' survey ship, "John Bischof," returned to Britain on July 14 after a successful voyage, marred only by the inability to relieve the post at Marguerite bay; it again sailed for the Antarctic on Oct. 11 and reached Deception Island on Dec. 2. (See also Antarctica: Exploration and Discovery.)

J. A. Hu.

FAROUK I, King of Egypt (b. Cairo, Feb. 11, 1920), the only son of King Fuad I, invested on July 29, 1937. (For his early life see Britannica Book of the Year 1949.)

During 1949 rivalry between the palace and the Wafd party, led by Nahas Pasha, continued. On April 21, King Farouk received Husni el-Zaim (see OBITUARIES), the dictator of Syria. On Oct. 6 he solemnly exhorted the country to ensure the preservation and success of the coalition; but it was not long before party polemics destroyed the coalition cabinet (see EGYPT). Addressing the Arab League council on Oct. 30, he pointed out that there was still an empty seat at their table—that of Palestine. On Nov. 19, in connection with the celebrations of the centenary of the death of Mohammed Ali, founder of the Egyptian royal house, the army presented to King Farouk a field marshal's baton.

FASHION AND DRESS. Spring of 1949 went down in fashion history as the flying panel period. In the previous autumn Balcenciaga had shown a fitted suit with narrow skirt, and a wide separate back panel. This original method of achieving a slim look combined with becoming movement made such an impression that the Paris spring collections were full of developments of this flying panel theme. There were side panels, back and front panels, all-round strip panels like maypole ribbons. Sometimes a three-step hem level was given by panels both longer and shorter than the skirt. Always the skirt itself was skin-tight.

Another fashion detail which grew to such proportions as to affect the silhouette was the pocket. Breast-high pockets, funnel-shaped, had flaps pointed and stiffened like calla lily petals to stand up above shoulder level. In some evening dresses the entire bodice consisted of twin pockets. Pouch pockets and huge flap pockets, placed far to the side, widened the hips.

The spring and summer also saw a new low level in daytime necklines. Even simple day dresses had necklines which plunged narrowly almost to the waist. Late-day dresses were apt to have immensely wide deep necklines.

Coats grew collars which rose high at the back, then turned down in a sloping line to become miniature capes. There were some fitted, bell-skirted coats, but the pyramid coat, sloping out from neck to hem, was the prevailing line.

Christian Dior showed the first short-and-long evening dress, spiralling from above the knee to train length. This
and the three-step hem levels caused by varied length panels were the forerunners of a whole crop of uneven hems in the autumn collections. Peter Russell christened them "disturbed hemlines": and since the close affinity between fashion and the feeling of the times was now generally conceded, it was hardly surprising that a period of such political and economic uncertainty should be reflected in fashion uncertainties of this kind.

The later the hour, the more skirt lengths wavered. By day the general level had risen again to 14 or 15 in. from the ground, sometimes rising further at a wrap-around point, or slit for walking freedom. Late-day and evening skirt lengths were extremely erratic. The floor-length crinoline skirts, which had had such a long innings, were kept for débutante and ball dresses. A new evening dress line was widely draped at the hips, narrowed to the ankle and then considerably slit. Newest of all for Europe (but already familiar to America) were the strapless evening dresses in rich fabrics with street-length skirts: a few full, but the majority slim sheaths—the 1920's all over again, except that these dresses were invariably belted, in contrast to the unbroken line of that earlier period. Dior's ultra-short sheath, with a huge hip-swathe trailing the floor, was the most dramatic of a whole range of models which achieved short- and-long hemlines by panels, wrap-around swathing or slanting overskirts. Kerchief-pointed skirts, wavering between knee and ballet length, were another aspect of hem-line uncertainty and another reminder of the '20s—also recalled by the ever receding length of hair.

The short hair of late 1948 was still long enough to curl out like a drake's tail at the nape but late 1949 saw actually shingled heads and that variant, the gamine hair cut, reputedly begun by mannequins fretting their short hair unevenly with razor blades but soon developed through more orthodox means by the hairdressers.

Of course, this short hair went along with head-clasping hats. Most of these were small skull-caps, "beanies," cloches, berets, miniature toques and helmets. There were however, a few large hats, still with nothing at the back to impede the high collars but with wide side-to-side brims or jutting shovel brims—heralding, perhaps, a forward movement in hats to come. The last months of 1949 saw the beginning of several important trends. One was again due to Dior: a dropped, markedly extended shoulder line—the first sign of an important shoulder treatment since the removal of square padding left shoulders naturally rounded. These new shoulders were still sloped and unpadded but half-way between shoulder and elbow Dior attached a gathered flounce, often buttoned, sometimes lined with fur, so that it stood out.

Another trend was the moulded body-line, interrupted by sharp-angled shapes in collars, cuffs and stiffened hip draperies. This contrast of soft and sharp was achieved by using soft fabrics and stiffening them with a crisp lining at strategic points.

Another new line, likely to develop, was the bloused back, above a sharply belted waist and tube skirt. Skirts in general narrowed as the year went on.

There was a marked tendency towards asymmetry in clothes of all types. One never would be longer than the other; a peplum would spring from the hip at one side only; a line of buttons (and buttons were everywhere) would march down one side of a bodice or skirt; necklines were cut to one side; evening dresses had one shoulder strap.

Colours continued dark or neutral. A whole range of "charcoal" colours, as if black had been mixed with them, appeared. There was much beige and grey. Blue, petrol and thunder blue and royal blue, returned, especially with black. Navy blue was chosen for winter and for evening, and other colours particularly favoured were dark greens, many browns and clear geranium reds.

Fabrics showed a new feeling for nobbly bouclé, fleecy woollens. Prodigious heavy coatings, with reversible plaid and plain were a first favourite. Stiff silks and rayons—taffeta, brocade, moiré, satin—were still universal for afternoon and evenings. There was much velvet, used alone and combined with wool.

Long gloves went out to meet the three-quarter and elbow-length sleeves. In the evening they rose to shoulder level; were smartest in black glacé kid. Leather belts pulled in every waist—on suits, day dresses, evening dresses. Court shoes and naked sandals (with covered toes and heels) divided the honours. Coloured shoes were seen in shades of ivy leaf green, pewter, blonde, bronze and dark red. Yards of pearls circled necks and dropped into deep necklines. Huge chandelier earrings swung to the shoulders—piquant contrast to the ragged gamine hair cut.

Nylon lingerie appeared in sufficient quantities to be on display instead of only under the counter. Corsets in deep blue and other unconventional colours were a welcome proof that better supplies were making fashion experiments possible.

Realistically—to meet their customers' shrinking budgets—a number of couture houses in Paris and London launched or expanded boutiques, little shops selling accessories and more moderately priced simple clothes, ready-to-wear, or needing only one fitting.

(A. Ws.)

Men's Fashions. In the men's fashion field, 1949 saw the death of the exaggerated drape jacket, which hung loosely from the shoulders with hardly any indentation at the waistline. "Drape" was a style which originated in England at the end of the 19th century and gave an illusion of broader shoulders and deeper chest. After World War II it returned to England from America in such exaggerated forms that the style leaders at last decided that it no longer had a place in men's fashions.
The evolution of men's clothes, however, was a very slow process and each succeeding style had necessarily to be in the nature of a modification of its predecessor. Consequently 1949 saw the introduction of jackets concentrating on softer lines but still retaining a moderate drape over the chest and natural rounded shoulders. A style reminiscent of Edwardian days, it was completely opposed to the padded square shoulder effect of former years. Lower placing of the waistline and pockets gave an illusion of increased length. Trousers were narrower and the effect of the style was to give a neat tapering line with smallness at the bottom.

In men's sports clothes the trend veered away from the separate jacket and flannel trousers. The well dressed man chose a sports ensemble designed expressly for his particular purpose—golf, walking, riding, etc. For general week-end wear the two-piece country suit, correct in the open as well as at the house party, became the accepted garb.

The return to favour of tails after a long absence enforced by austerity conditions and the increasing popularity of the two-piece double-breasted dinner suit were other highlights. Midnight blue was replacing black for these formal clothes; under artificial light it appeared richer and blacker than black itself. (R. J. M.)

During the year, Federal Reserve holdings of government securities declined $4,400 million, of which $3,800 million took the form of a reduction in holdings of marketable bonds. The Federal Reserve banks sold long-term restricted issues to savings banks and private pension and trust funds. The liquidity position of commercial banks was increased through their acquisition of short-term government securities with funds released by reductions in reserve requirements.

Reserve requirements for member banks were reduced substantially during 1949. At the beginning of the year, reserve requirements against net demand deposits were 26% for central reserve city member banks, 22% for reserve city member banks and 16% for country member banks, while reserve requirements against time deposits at all member banks were 7 1/2%. At the end of the year, reserve requirements in effect were 22% against net demand deposits for central reserve city member banks, 18% for reserve city member banks and 12% for country member banks, with a reserve requirement of 5% against time deposits at all member banks.

Regulation W, relating to consumer instalment credit, was twice eased by the board of governors in the first part of 1949. From March 7, the standard maximum maturity period on all extensions of consumer instalment credit was made uniformly 21 months instead of 15 to 18 months, and minimum down payments on furniture, appliances, etc., were reduced from 20% to 15%. From April 27, the maximum maturity period on consumer instalment credit was further increased to 24 months and the minimum down-payment requirement on furniture, appliances, etc., was further reduced to 10%. In both revisions the 33 1/3%, minimum down payment on cars was retained. On June 30, the temporary authority granted by congress, under which the board of governors issued Regulation W, expired.

From March 30, the board of governors amended the supplements to Regulations T and U so as to reduce the margin requirements for purchasing registered securities from 75% to 50%. Other amendments to Regulations T and U, effective from May 16 and July 20 respectively, increased the loan value for securities acquired through the exercise of subscription rights and removed margin requirements applicable to credit for financing the functions of specialists on the New York stock exchange. (J. K. L.)

FENCING. The world championships held at Cairo in April were the outstanding fencing event of 1949. At foil and épée the Italians showed marked superiority over their French rivals, while at sabre, the Hungarians being absent, they swept the board. Christian d'Oriola scored the only French success in the men's foil individual, and Ellen Preiss-Müller of Austria retained the ladies' title she won in 1947 at Lisbon. These championships were memorable for experiments with a system of direct elimination and the annulment of the double hit at épée. Both innovations were generally disliked, and the congress of the Fédération Internationale d'Esgrima decided in June to revert to the normal rules, including the pool system.

In other major events, the amateur and professional competition in Paris for the Coupe Mableau at foil was won by Maître Battesti of France and the Coupe Monal at épée by Edouardo Mangiarotti of Italy. In Britain, the appointment of a national fencing coach and the inauguration of national and junior coaching schemes marked the notable development of the sport since World War II. In Great Britain the ladies' foil championship was won by Miss Gillian Sheen. Champions in the men's events were Rene Paul (foil), Peter Díx (épée) and R. F. Tredgold (sabre). St. Paul's won the public schools' championship. (C. L. de B.)
FERTILIZERS—FIELD SPORTS

United States. The number of entries in the 1949 national championships was the largest in the history of fencing in the United States. In the team events, the Fencers club of New York won the foil team championship for the first time since 1936 with the Salle Santelli of New York second. The Salle Santelli retained its three team titles, saber, épée and three-weapon.

For the first time a foreign visitor won the national fencing championship when Umberto Martino (Italy) defeated George Worth of the Salle Santelli 10-8 in the saber championship. In the Pacific coast championships, Alfred Snyder of the Olympic club of San Francisco won the men’s foil; Bruce McInerney of the Faulkner School of Fencing of Los Angeles won the épée. (W. A. Dw.)

FERTILIZERS. The consumption of fertilizers in the United Kingdom increased in 1948-49 to a new record level. The amount of phosphate used was about 12% above that in 1947-48; there were only small changes in the amounts of nitrogen and potassium.

It was not certain that progress in the use of fertilizers would be maintained during the early 1950s. Since Oct. 1940 fertilizer prices had been stabilized by means of subsidies and, as the costs of labour, agricultural raw materials and farm products rose, fertilizers became steadily more profitable. It was now proposed to withdraw this subsidy in two approximately equal stages during the fertilizer years 1950-51 and 1951-52, the increased cost being taken into account at the annual price review of agricultural products. The price increases were likely to be particularly high for materials obtained from countries with hard currencies, and if a result farmers on the poorer and therefore more responsive soils were led to cut down their outlay on fertilizers the agricultural expansion programme might be jeopardized.

The world reserves of raw materials for fertilizers were reviewed in several papers presented to the United Nations Scientific Conference on the Conservation and Utilization of Resources held at Lake Success, New York, in the summer of 1949. At anything like current rates of consumption problems of reserves of phosphate and potassium would not arise for a thousand years or more. The known reserves of phosphate rock were estimated at 26,000 million tons, there were also huge additional quantities in deposits for which little technical data were available. Reserves of the high-grade phosphate rock were, however, limited and might need to be husbanded. The reserves of potash in lake brines and soda lake deposits amounted to 5,000 million tons K₂O but they were very unequally distributed. In addition there were vast potential sources in the ocean and rock but potassium from these sources had not hitherto been used beyond the experimental scale. The reserves of nitrogen in coal amounted to 8,700 million tons and in nitrate of soda to 1,000 million tons. The world supply of nitrogen fertilizers depended mainly on the synthesis of ammonia from atmospheric nitrogen which already consumed the equivalent in power of 20 million tons of coal annually. Should the world supplies of sulphur become exhausted the phosphate fertilizer industry would require about the same quantity of power to produce alternative fertilizers to superphosphate.

The efficient use of fertilizers depends on a sound judgment of the special needs of individual soils and crops. The various chemical and biological methods of diagnosing nutrient deficiencies and estimating fertilizer requirements were well reviewed in Diagnistic Techniques for Soils and Crops. The problem of phosphorus utilization by crops under a range of agricultural conditions was studied by field experiments on various fertilizers and organic manures containing radio-phosphorus (P²³). When the technique has been critically studied and developed it should become possible in this way to determine what proportion of the phosphorus comes from the added fertilizer and what from the soil.

World. In the year ended June 30, 1949, world consumption of common and superphosphates and fertilizer materials (exclusive of U.S.S.R.) included 3,292,000 tons of nitrogen, 4,966,000 tons of phosphoric acid and 3,220,000 tons of potash, increases respectively of 44%, 42% and 37% above the prewar average. During the year Europe continued as a net exporter to continental areas of the combined nutrients; South America remained a net exporter of 205,000 tons, while North America changed to a net exporter of 279,000 tons. Africa was a net importer of 165,000 tons, Asia of 445,000 tons and Oceania of 11,000 tons. North America shipped large quantities of fertilizer from Canada and the United States to occupied areas in Germany, Japan and Korea. Large shipments also went to China.

Total world production (including U.S.S.R.) of phosphate rock in 1948-49 reached 18,082,000 metric tons of material averaging about 32% P₂O₅, about one-half came from the United States, one-third from North Africa, one-eighth from U.S.S.R. and one-twentieth from the Pacific islands.

FIELD SPORTS. The most important event of the year was the defeat in the House of Commons of the Protection of Animals (Hunting and Coursing Prohibition) bill, which was introduced by a private member and rejected by 214 votes to 101. A further private member’s bill to prohibit foxhunting was then withdrawn. The government subsequently set up a committee to consider the question of cruelty to wild British mammals.

The hunting season was remarkable for the unusually dry weather and many packs suffered from lack of scent. Few hunts enjoyed consistently good sport, yet many had occasional brilliant days. There was little foot and mouth disease but, especially in the home counties, a certain number of hounds suffered from foot infection. The sport enjoyed by beagles and harriers was comparable to that of the foxhounds. The dry weather developed into the severe drought which lasted through the summer of 1949. Rivers fell below their normal levels and this affected otterhunting. But the condition of this sport was improving every year. The banks of rivers which were damaged during World War II were returning to normal—as in the Crowhurst country and packs, such as the Pembrokeshire and Carmarthenshire, which were resuscitated after the war, went from strength to strength. Cub-hunting began in the middle of August and a generally successful season was enjoyed. The dry weather had been followed by widespread and heavy rain by the time of the opening meets. The recovery in grouse stocks noted in 1948 was maintained and, except in a few localities, the "Twelfth" began a very successful season. In Yorkshire particularly there were a number of good bags with many three-figure days. The good results may be attributed largely to the open winter of 1948-49 and to suitable conditions at nestling time, which resulted in early broods of strong birds. No reports of grouse
disease were noted and heather was generally in excellent condition. There was some indication that high costs and the difficulties of obtaining staff reduced the number of lettings of moors, especially of those with lodges. Wild pheasants again showed their ability to thrive in an average season with little artificial aid; and there was a fairly general improvement in partridge stocks. As with grouse, low-ground game benefited by an open winter and a fine spring and summer.

Anglers would long remember 1949 for the drought which brought the water too low and made it too hot for salmon to run after May, except in a few rivers mainly in Scotland; but there was a magnificent run of spring fish which went up the rivers very early, often before the season opened so that on many of the lower beats which usually fish well early in the season, the fishing was poor while the up-stream beats (usually deserted) returned good catches. Rivers showed great contrasts, some reporting the best season they had had for years while others got practically no fish at all. The netting season on the coast was everywhere first class. Trout rose poorly in general, but there was almost the finest mayfly season within living memory.

FIGL, LEOPOLD, Austrian statesman (b. Rust, Lower Austria, Oct. 2, 1902), chairman of the Austrian People's party (Österreichische Volkspartei) and from Dec. 19, 1945, chancellor (prime minister) of Austria. (For his early career see Britannica Book of the Year 1949).

On the eve of the elections of Oct. 9, 1949, he demanded that the evacuation of Austria be placed on the agenda of high policy discussions, irrespective of whether a peace treaty would be coming into existence or not. After the elections it took him four weeks of strenuous bargaining to reform his coalition cabinet composed of representatives of People's and Social Democratic parties.

FIJI: see PACIFIC ISLANDS, BRITISH.

FINLAND. A republic of northeastern Europe. Area: 130,165 sq. mi., including inland waters (20,190 sq. mi.) but excluding 17,596 sq. mi. annexed by the U.S.S.R. in 1944. Pop.: (Dec. 31, 1940, census) 3,887,217; (mid-1949 est.) 3,958,000. The density of population varies from 20 per sq. mi. in the south to 0-8 per sq. mi. in the north. Languages: (1940 census): Finnish 3,327,534 (87.5%), Swedish 353,985 (9.3%), Russian 7,210, Lappish 2,345. Religions: Lutheran with a small admixture of Greek Orthodox, Raskolniks (a Russian sect), Roman Catholics, Jews, etc. Chief towns (Dec. 31, 1946, est.); Helsinki or Helsingfors (cap., 371,662; Turku or Åbo, 96,470); Tampere or Tammerfors (89,071). President of the republic, Juho Kusti Paasikivi; prime minister, Karl August Fagerholm (q.v.); minister of foreign affairs, Carl Enckell.

History. For the Finnish population as a whole, 1949 was a good year. After a decade of hardship and privation, food and clothing and consumer goods in general at last became available in abundance. All foodstuffs were off the ration except coffee and sugar, and the supply of those was adequate. The housing shortage was still a severe inconvenience but new buildings were being put up at an increasing rate and there was some relaxation in the restriction to one-room-per-person.

While consumers were having a good year, the producers concerned in the export trade were meeting serious difficulties. The recession in world trade involved a fall in the prices offered for timber and timber products, including paper, which make up over 90% of Finland's total exports. Stocks began to pile up in the paper and cardboard mills, and at the end of March 50,000 men were unemployed. The most obvious way of reducing costs—a cut in wages—was barred while Finland was under a Social Democratic government. The only way of increasing exports that the government could see was to devalue the currency and to find a way of buying American machinery quickly for the mechanization of the forest industry.

On July 5 the Finnish mark was devalued (from 547 to 643.8 to the £) and on Aug. 1 the International Bank for Reconstruction granted Finland a loan of $12 million. Of this loan, $10 million were to be spent on machinery for the forest industry and $2 million for equipment for hydroelectric stations.

The Finnish Communist party raised an outcry against both these measures. The loan was decried as "binding Finland to Washington capitalism" and the devaluation was condemned as bound to lead to an increase in the cost of imports and hence in the cost of living. The Communists still had enough influence in the trade unions to induce a number of them to demand a rise in wages and, when this was refused, to launch a wave of strikes. The strikes began among the timber sorters in Kemi and spread down the Ostrobothnian coast until 15 harbours were closed by Aug. 19 and the export trade was paralysed. But the Federation of Trade Unions took the view that there was no case for a general increase in wages because the cost of living index had not risen and by an agreement of Oct. 1947 wages had been pegged to that index-figure; the federation therefore refused to countenance the strikes and expelled the seven unions whose members were taking part in them. The strikes then collapsed, and the seven unions begged for re-admission to the federation, which was granted only to those which accepted stringent conditions of membership. The August strike wave and its outcome did much to discredit the Communists throughout the country and added to the prestige of the government, which had handled the crisis with laudable firmness and discretion.
The government came through the year with success but not without difficulty. The Social Democrats had only 54 of the 200 seats in parliament and, although they could usually count on the support of the Conservatives, the Swedish party and the Liberals, they had to face the opposition of the 38 members of the S.K.D.L. (the Finnish People's Democratic League, which was the name by which the Communists and their fellow-travellers chose to be known) and also on many occasions of the Agrarian party which held 56 seats. Under the leadership of Dr. Urho Kekkonen, the Agrarians in parliament grew increasingly restive during the year and on one occasion when they made an unnatural alliance with the S.K.D.L. the government was able to survive what amounted to a vote of no-confidence by only the narrowest margin of votes.

Towards the end of the year thoughts of the coming presidential election tended to swamp other political considerations. Under the Finnish constitution the election was due to be held in mid-Jan. 1950. The government wanted to pass a constitutional law to prolong the mandate of the present president, Dr. Paasikivi, for a further two years, and there is no doubt that most of the citizens were in favour of this; but such a law would have needed the agreement of a five-sixths majority and the S.K.D.L. refused its assent; and the Agrarians, whose leader had ambitions for the presidency, were glad to see it dropped.

The economic situation looked happier as the year went on. The harvest turned out to be fairly good: the hay crop was above the average, the yield of wheat, rye, oats and barley was medium and only the potato crop was poor. When Great Britain devalued its currency in September, Finland was obliged to take the same course, raising the exchange rate of the U.S. dollar from 160 to 231 Finnish marks. This was followed in November by a loan of $2.3 million from the International Bank, to enable Finland to buy dollar equipment with which to expand timber exports to Great Britain, Denmark and Belgium.

Throughout the year Finland's foreign relations were harmonious. The U.S.S.R. waived its claim to 441,000 gold dollars due as a fine for late delivery of certain articles included in the war indemnity. When the sixth year of indemnity payments began on July 1, Finland's debt was, generally speaking, confined to deliveries of electrical equipment, machinery and ships. To the relief of everyone in Finland, the Soviet Union made no untoward difficulties about the indemnity programme.

(J. H. J.)

Education. (1947) Schools: elementary 6,036, pupils 463,400; secondary 299, pupils 81,160; training colleges 8, students 1,341; high schools for adults 71, pupils 4,400; technical schools 444, pupils 35,480. Universities (1948) 3, and institutions of higher education (1948) 4, students 13,500, professors and lecturers 936. Illiteracy (1930) 0-9%.

Agriculture. Main crops ('000 metric tons, 1948): wheat 265; barley 214; oats 640; rye 199; potatoes 1,950; root vegetables 837; cultivated hay 2,425; hemp and flax (1946) 2-7. Livestock (1948): cattle 1,452; sheep 999; pigs 304; horses (March 1949) 395; chickens 1,918. Production ('000 metric tons, 1948): milk 1,750; butter 30; cheese 7; meat (including offal) 110. Fisheries: total catch (1947) 46,000 metric tons.

Industry. (1946) Industrial concerns 5,691; persons employed 236,723. Fuel and power: electricity (million kWh, 1948; 1949, six months) Brk. 2,780,000. Raw materials (in metric tons, 1947): pig iron 70,182; ferro alloys 453; steel ingots 71,459; steel castings 5,216; copper (mine production, 1948) 33,322; cobalt 50; nickel 82; selenium 617; gold (fine troy ounces) 10,642; silver (fine troy ounces) 188,821. Forest products (1948): sawn goods ('000 standards) 815; cellulose ('000 metric tons) 1,080; mechanical pulp ('000 metric tons) 138; newsprint ('000 metric tons) 328; other paper ('000 metric tons) 233; board and cardboards ('000 metric tons) 139; plywood ('000 cu. m.) 210.

FINLAY, DONALD, British air force officer and athlete (b. May 27, 1909), joined the Royal Air Force as an aero-engine fitter in 1925 and was commissioned ten years later. During World War II he served in the R.A.F. fighter command and was awarded the Distinguished Flying cross. He also holds the Air Force cross. He first represented Great Britain in the 110 m. hurdles in the Olympic Games in Los Angeles in 1932. He reached the final, as he did again in Berlin in 1936. The games in London in 1948 again saw him in the British team: as the oldest British competitor, he was given the honour of pronouncing the Olympic oath on behalf of the entrants from 59 nations. He fell when leading in his heat: but for this misfortune he might have reached his third Olympic final. In 1937 during a tour of Scandinavia by a team of British athletes he recorded a time of 14·1 sec. for the 110 m. hurdles. In 1949, at the age of 40, he surpassed his previous efforts when in an international match between Britain and France at White City, London, on Aug. 1, he broke his own 12-year-old British national 120 yd. hurdles record by .1 sec., with a time of 14·4 sec. A week later at Ibrox park, Glasgow, he returned 14·5 sec., one-fifth of a second faster than his own Scottish all-comers' record. He was A.A.A. champion for the 120 yd. hurdles for seven consecutive years, 1932-38, and for the eighth time 11 years later in 1949. In July he announced that he would not race again in the A.A.A. championships. (See also ATHLETICS.)

FISHERIES. Great Britain. An increased interest in fisheries was part of the world-wide search for further food resources for populations in danger of outgrowing the capacity of over-taxed land. In European waters only two sources of fish supply could be contemplated with equanimity, the cod fisheries and the herring fisheries. Both these were subject to local fluctuations but so far they showed no signs of exhaustion. In the fisheries for the various kinds of flat fish and hake, there was a marked decline, which might have been arrested had the conventions of 1938 to 1946 been strictly observed. The statistics of Great Britain showed a marked decline in the landings from the North sea and other home or nearby waters and a steady increase of landings from distant waters, Bear island, Barentz sea, coast of Norway, Iceland and Greenland. The output of the herring fisheries was on the whole steady. The popularity of the herring endured and seemed likely to endure, but there were clear signs that cod was rapidly losing public favour. The increased demand for fish resulted from shortage of other foods. The popularity of fish, in Great Britain at least, always rested mainly on the 'prime fish': turbots, brill, soles, etc., which the North sea and other home waters produced so abundantly but within a restricted area. The decline of the 'prime' fish and of hake (which had also come to achieve popularity) seemed to bring the fish supply into disrepute and the market for cod and most of the gadoid fishes was dull in spite of the general scarcity of other foods. Nevertheless, new building proceeded. Eighteen large trawlers were added to the British distant water fleet in 1948 and a further 40 were added in 1949. There should, therefore, have been no lack of fish, if the fish were there. In the near or middle waters fleet an increase of 14 new vessels was expected.

A Sea Fish Industry bill before parliament in 1949 provided for state loans towards new building and reconstruction in the near and middle waters fleet and would have enabled orders to be made and enforced to prohibit the sale of undersized fish as was proposed in the convention of 1946, besides conferring statutory powers to limit the British North sea fleet to 85% of the fishing power available in 1938, a difficult step to take in the absence of reciprocity in other countries. The same bill would enable various regulations to be enforced for the more efficient handling of fish supplies, including the licensing of boats, of wholesale fish businesses and processing establishments as a means of enforcing such regulations.

British Colonies. First place in 1949 may justifiably be given to a valuable and most interesting British report The Production of Fish in the Colonial Empire by C. F. Hickling, fisheries adviser to the secretary of state for the colonies...
FISHERIES

(H.M.S.O., London, Dec. 1948). In general, accurate figures of colonial fish production were available in none of the colonies except Malaya, the only colony which had, before 1939, a staff exclusively devoted to the care and improvement of the local fishing industries. Malaya had always produced large quantities of fish, and in 1939 had an exportable surplus of over 11,000 tons of salt fish. By 1949 the prewar level of production in Malaya had already been achieved and its long-established and most efficient fisheries department was increasing its staff of trained fishery officers with a view to the expansion of the industry. An important part of the scheme of expansion was the establishment, or re-establishment, of a school for fishermen with power craft, which would carry out experimental fishing and tuition simultaneously; Malaya might be said to have stood by itself among the colonies in the matter of technical service.

Fisheries play a considerable part in the economy of many, if not most, of the British colonies and there were many indications that with training in improved methods of fishing and the handling of fish products most of the colonial fisheries could be widely developed. But for this purpose trained technical staffs were needed and there was a serious lack of specialist staff of all types. It was therefore necessary to begin at the beginning. The rapid training of staff began with a professional course, which was constantly varied in the light of experience gained, and endeavoured to fit into nine months a grounding in the technique of fishing, preservation and distribution, net making and scientific research. The emphasis of the course was on the word preliminary. At its conclusion officers under training were sent on a term of duty which would be followed by further instruction following practical experience. The underlying purpose was to increase fish production within the limits of rational fishing.

The primary aim of all development of colonial fisheries was the satisfaction of local needs. But frequently there was or could be a surplus for export and it was intended that advantage should be taken of this possibility where it existed. For example a survey, begun in Jan. 1948, of the Mauritius and Seychelles area, with the dependent islands, where the output of fish was proving abundant, aimed especially at a trade in frozen fillets with south and east Africa. Samples, however, were sent to Great Britain and elsewhere. A large private venture, which looked to the survey for guidance, was designed to satisfy the fish requirements of Mauritius, ship the surplus to Madagascar and return the ships to Mauritius with cargoes of meat.

Nigeria was always a considerable fish consumer and a regular importer of dried fish from Norway, as well as from the upper waters of the Niger in French West Africa. The colony possessed a small fisheries department which was investigating the creeks and lagoons of the delta. Results suggested that these waters were already fished to the limit by native methods; but the department was preparing to investigate the possibilities of the adjacent sea-fisheries, which had not been exploited by the local fishermen.

Great possibilities for development in Sierra Leone were revealed by experiments with a 70 ft. Brixham trawler fitted with a diesel engine. This vessel was to be replaced by a modern diesel trawler which, it was anticipated, would become the nucleus of a considerable fleet to catch fish for local needs and for distribution elsewhere. The prospects of the Gambia were also good. Meanwhile fishery research was being organized on a regional basis through a West African Fisheries Research institute established in Sierra Leone.

In east Africa lake and river fisheries greatly predominate. Uganda has great fishing resources in lakes and rivers, effectively exploited by native fishermen, but it was thought that production from these sources could be multiplied. In Kenya trout fisheries had for some time past been developed with striking success and experiments in stocking some of the smaller lakes had been successful. In addition an extensive survey of the sea fisheries was to be carried out off Kenya, Tanganyika and Zanzibar, where it seemed probable that there were considerable untapped resources. Tanganyika also had fisheries on Lakes Victoria, Tanganyika and Ruhwa; and a Lake Victoria Fishery board was established under the British East Africa high commissioner’s office to survey the fisheries of that lake and experiment in the use of more efficient methods of fishing. Research was provided for by a fisheries research station at Jinja in Uganda. A qualified biologist surveyed the fisheries of Lake Nyasa and recommended an increase in the supply from the lake, whilst avoiding over-fishing. His report was being considered by the Nyasaland government.

In Northern Rhodesia, the chief fish resource of which is Lake Bangweulu, a fisheries officer was appointed; he began work there and in the Luapala river, where there were good prospects of development and where a fisheries research station was being planned. Taking east Africa as a whole, the inland water fisheries were much more important than the sea fisheries and there was a keen demand for fish. The development of fisheries in the Gulf of Aden was handicapped by lack of harbours, poor communications and the general backwardness of the country; but a survey of the fisheries begun in Jan. 1948 suggested considerable possibilities for development especially in the export of canned products.

In the far east, apart from Malaya and fishing carried out in Fiji, Sarawak and British North Borneo, Hongkong amongst British colonies possessed a flourishing fishery which was hampered by economic chaos in China, its principal market, and plans for a fisheries research station at Hongkong were approved. The West Indian waters were poor in fish because the sea in those regions mostly lacks the nutrient salts upon which a healthy fish population depends.

The productivity of the British colonial fisheries, sea and inland, was much greater than was generally realized and therefore great possibilities of important additions from this source to the available supplies of protein food, as Hickling’s Survey made clear.

India. The government of India embarked upon a five-year plan for the development of Indian fisheries along the lines of modern methods employed in Europe and Japan. As a contribution to this plan they imported machinery for a fish-freezing plant from the United States, negotiated with Japan for the purchase of deep-sea fishing vessels and considered the purchase of trawlers from Scotland and Holland.

Their preliminary target was 10,000 tons of fish daily. With this in view they were carrying out an exhaustive survey of their coastline of some 3,200 mi. and establishing “pilot” fishing stations based upon seven ports. Each of these stations was to be equipped with cold storage for 4,000 tons of fish. They also proposed establishing a fisheries research station in the port of Bombay where all research on the subject was to be co-ordinated.

Their plan further included the protection and cultivation of fresh-water fishes, which would begin with the establishment of stocks in some 340 villages in the province of Delhi and could be extended in time to all inland waters.

International Co-operation. There was marked progress, largely through the encouragement of the U.N. Food and Agriculture Organization, in the development of international co-operation in the scientific, technical and economic study of fisheries for the rational exploitation and utilization of their products. It was in this field that F.A.O. seemed most likely to achieve success, and it owed not a little to the
excellent example set during some 47 years by the International Council for the Exploration of the Sea. The question of reviving the International Commission for the Scientific Study of the Mediterranean Sea was fully discussed at a meeting held under the auspices of F.A.O. in Rome from Sept. 19-24. The meeting was attended by delegates from France, Greece, Italy, the Lebanon, Turkey, the United Kingdom and Yugoslavia. With the exception of the French delegate, all those present supported the proposal to set up a Mediterranean Fisheries council to organize studies of marine biology and the technical and economic problems of fisheries. The F.A.O., however, although it recognized the importance of marine biology as the foundation of rational exploitation, was most directly concerned with the availability of fish for food. Agreement was eventually reached to set up a General Fisheries Council for the Mediterranean with functions covering all fishing problems in very wide terms and with instructions to co-operate closely with other international bodies in matters of mutual interest. F.A.O. undertook to provide the secretariat of the council if the report were accepted. These proposals were to come up for discussion at the fifth session of the conference of F.A.O.

A more ambitious project was embodied in the Convention for the Conservation of the Northwest Atlantic Ocean, signed at Washington, D.C., on Feb. 8, 1949. "in order to make possible the maintenance of a maximum sustained catch from those fisheries." The terms of the convention were signed on behalf of the governments of Canada, Denmark, France, Iceland, Italy, Newfoundland, Norway, Portugal, Spain, the United Kingdom and the United States.

The area covered by the convention was wide and elaborately defined, extending as far east as the west coast of Greenland, and was to be divided into five sub-areas, for which an equivalent number of "panels" were to be appointed, like the commission, by the contracting governments. Each panel was to be free to adopt rules of procedure and by-laws for the exercise of its functions. The machinery and procedure of the convention were elaborate. The over-all duty of the commission, working through the panels, was to organize scientific investigation, "for obtaining and collecting the information necessary for maintaining those stocks of fish which support international fisheries in the convention area." Measures contemplated were open and closed seasons, closed areas, size limits for any species of fish, regulation of fishing gear and a prescribed over-all limit of the catch of any species of fish. The convention would become operative when ratified by four contracting governments. It was to come into force with regard to other governments as they ratified and non-contracting governments might adhere.

Meanwhile the International Council for the Exploration of the Sea, whose activities covered the fisheries of the northeastern Atlantic, carried on its good work. It was represented at the Northwest Atlantic conference by two of its vice presidents as observers. The annual meeting of the International council was held at Edinburgh. According to practice two special scientific meetings were held at which lectures were delivered on selected subjects, on this occasion fishing gears and their effects, and shell-fish. Those affecting shell-fish fisheries were largely based on British experience and dealt with many problems, especially the control of the menaces of pollution and exotic pests, and the elucidation of failures of spat-fall. The English fisheries department embarked on a vigorous expansion of its programme of research. Meanwhile there was a marked drift of the English oyster fisheries from east to west, from the Thames estuary to the Fal and Helford rivers in particular. This was largely due to the comparative cleanness of the western waters and absence of such imported pests as the slipper limpet. Also there was greater freedom here from severe frost. The aim of the department's activities in the field was to arrest the rapid decline of production which had marked the oyster fisheries in recent years and to promote large scale development.

International Differences. It was unfortunately easier to secure international co-operation in scientific and technical research into fishery matters than to achieve co-operation in applying the results of research. The whole question of international rules governing sea fishing was complicated by a number of considerations which, through their very nature, were difficult to bring into harmony. Broadly speaking, the conflict was between the maintenance of national interests and the acceptance of international community of interests. Every country with a coast-line had of necessity to exercise some dominion over the waters adjoining its coasts. Great Britain had long claimed jurisdiction up to three miles seaward and firmly refused to accept any other claim for more extended jurisdiction. In general this line was followed by actively maritime nations. The question of territorial waters was closely connected with fisheries because fishing operations were in the main limited to waters adjacent to the coast and, with rare exceptions, fishermen regarded themselves as entitled to go where the fish were, though most were prepared to respect the three-mile limit. This limit was the one most widely and influentially supported; but claims of jurisdiction up to various longer distances were advanced by individual countries. Such claims were an obstacle to fishing conventions because of the difficulty of agreement over areas involved. They obviously would not apply to waters within the exclusive jurisdiction of a particular country, though, as was pertinently remarked, fishes are no respecters of territorial limits. Hitherto, conflicting claims in respect of territorial waters had not led to open conflict between nations. As regards fisheries the Norwegian claim to territorial jurisdiction up to four miles was a matter for argument with Great Britain for many years as the cod fisheries off Norway are very prolific, and many attempts were made to reach agreement by negotiation. The last attempt to agree ended in failure; there were several untoward incidents at sea; British vessels were interfered with and, in the last resort, this long-standing dispute was referred to the International Court at The Hague.

The extravagant territorial claims in the sea advanced after World War II by various powers in the American continent did not cause any international incidents; but a good deal of uneasiness was caused by what seemed to be an attempt by a Scandinavian bloc to oust British fishing vessels from the rich fishing waters west of Greenland by denying them the use of port facilities. Iceland made or threatened to make extensive claims of jurisdiction. But competition for fish became an obstacle to agreement about regulations for the benefit of all parties. There were of course other contributing factors, from local prejudice to naval co-operation—for a prosperous fishing industry is a valuable contribution to naval power. Hence, though conventions were agreed, they were not fully ratified. The Washington convention of 1946, intended to extend and strengthen the preceding conventions, beginning with that signed in London in 1938, was not yet fully ratified and the Northwestern Atlantic convention signed in 1949 seemed unlikely to become operative for some time.

The difficulty attending conventional agreements of this character was sharply revealed on consideration of the subject of naval defence. In proportion as a strong fishing fleet contributed to the naval strength of a maritime country it was difficult for that country to enforce limiting regulations tending to weaken its defence. There were naturally many other difficulties. No nation liked to restrict the profitable activities of its nationals. It remained to persuade them all
that control would in the long run provide greater and more enduring prosperity. (See also Marine Biology; Zoology.)

(H. G. M.)

FIVES—FLOODS AND FLOOD CONTROL

The Rugby fives amateur doubles champions B. M. W. Trappell (right background) and E. S. Isaacs (right foreground) playing in the Jesters club’s 21st birthday match at Windsor.

FIVES. Rugby Fives. For the first time in Rugby fives championships the winner of the singles title, B. M. W. Trappell, was also a winner of the doubles. Trappell beat E. J. Bailey in the singles final, and playing with E. S. Isaacs, beat P. A. Deane and A. C. W. Abrahams in the doubles. Oundle (J. R. Nicol and S. M. Pickard) was again successful in the schools doubles competition, and A. D. R. Dawes (Bedford) won the singles for the second time. Oxford won the university match.

During the year the Rugby Fives association appointed a sub-committee to consider the rules of the game. On its advice minor amendments to the rules were made and some rules for match play added. The association gave a dinner in April to Dr. E. F. Cyriax, its president, to mark the occasion of his 75th birthday. The Jesters club celebrated its 21st birthday on Dec. 31 with matches against the Rugby and Eton Fives associations at Windsor.

Eton Fives. Still without the war-damaged Queen’s club court, the Eton Fives association was much handicapped. A. G. Wreford-Brown and T. R. Garnett beat A. H. Fabian and M. W. G. Pryke in the final of the amateur championship (Kinnaird cup) and Charterhouse (M. J. Perkins and J. W. H. May) won the schools’ handicap competition. Oxford defeated Cambridge by two matches to one in the university match.

(H. L. B.)

FLAX: see LINEN AND FLAX.

FLOODS AND FLOOD CONTROL. Great Britain. The summer of 1949 and the previous winter were both dry seasons and serious and prolonged floods were few; but local authorities and catchment boards carried out flood control work planned as a result of the serious floods of 1947 and 1948. Many railway bridges in Scotland and northern England damaged in Aug. 1948 were repaired and lines fully re-opened to traffic. The River Trent Catchment board considered a scheme, estimated to cost £23,273,700, for major protection works in the Trent valley, which included the widening of certain river stretches and the construction of river barriers at Gainsborough, Lincolnshire. The River Wye Catchment board approved proposals for the second stage of the Monmouth flood relief scheme; and flood relief sewers were constructed in Hampstead, London, and in Salford, Lancashire.

In October the first instalment, costing about £3,000,000, of the Rimrose brook main drainage scheme was put into operation. Its object was to provide drainage facilities for undeveloped lands in the catchment area, where considerable housing development was proposed by the Bootle corporation and the Litherland Urban District council, and also to prevent serious flooding which had taken place periodically in Bootle, Litherland and Seaford, Lancashire.

Coast Erosion and Protection. The Coast Protection act received the royal assent in 1949 and provided for the establishment of both national and local responsibility for coast protection in Great Britain by setting up local coast authorities of two different types to deal with the problems of their areas. It gave wider powers to county district councils or borough councils on the coast, enabling them to carry out works to protect their lands and coastlines. Under these, the minister of health (for areas in England and Wales) or the secretary of state for Scotland could, where many interests were involved, set up coast protection boards, ensuring that the danger of lack of co-ordination evident in the past would be overcome. The bill also provided for financial assistance to the authorities concerned.

Many authorities carried out work in repairing and extending sea defences works. At Seaford, Sussex, the strengthening of the sea wall was continued and new groynes were built. The construction of a sea defence wall at Rhyl, Flintshire, began in November, with the object of checking a flood-high water mark which had advanced more than 1,500 ft. between 1871 and 1949. Prestatyn, adjacent to Rhyl, approved a scheme costing £235,000. At Lowestoft, Suffolk, work on sea defence estimated to cost £130,000 in the next five years was approved. The Essex Rivers Catchment board proceeded with plans to improve existing sea walls at an estimated cost of over £500,000, including work to be undertaken in consequence of abnormal tides during March.

Australia. The bill authorizing the Snowy River scheme consisting of a vast hydro-electric and irrigation project, including measures for retaining the flood waters for irrigation purposes and estimated to cost £200 million, passed all stages in the House of Representatives in June. The work was officially begun on Oct. 17 by the first blasting at one of the dam sites. In June, following heavy rain, the Hunter river burst its banks and inundation an area of 200 sq. mi. around Maitland and Kempsey, New South Wales, to be submerged. Some streets in Sydney were also flooded to depths of 5 ft. In order to minimize the dangers of floods in the future the New South Wales government adopted a flood control for the Hunter valley to cost over £10 million. The scheme comprised the construction of three reservoirs to be operated solely for flood control, while five other reservoirs were to be primarily used for irrigation.

Austria. A week of continuous rain in August caused the biggest summer floods for several years in many alpine rivers. The Danube rose 18 ft. in 36 hr. near Vienna.

Guatemala. In October, following several days of torrential rains, disastrous floods occurred causing the death of 4,000 people, and rendering 70,000 persons homeless. The value
of damage was over £17 million including the loss of nearly half of the country's coffee crop.

India. Among the irrigation and flood control projects under construction was Bhavani dam in Madras consisting of an earth structure below the junction of the Moyar and Bhavani rivers, where much excavation was done during World War II.

Italy. Floods occurred in the provinces of Benevento, Avellino and Salerno at the beginning of October as a result of torrential storms. An area of 1,000 sq. mi. was devastated and more than 30 people lost their lives. In November the river Reno broke its banks and flooded more than 30,000 ac. of farmland near Bologna.

Pakistan. The Lloyd barrage, on the river Indus and forming part of the world's greatest irrigation scheme, was the subject of grave concern when investigation showed serious cracks in the ashlar masonry of the piers, and remedial work was undertaken.

Uganda. Construction of the Owen Falls dam on the river Nile was commenced in the autumn of 1949. The scheme was for hydro-electricity in addition to irrigation and flood control and would enable abnormally high flood waters to be conserved as "century storage" or continuous storage over several years in conjunction with existing dams on the lower course of the river where water is stored during floods, to be used during the same year.

United States. The U.S. flood control act approved Oct. 13, 1949, provided $437,430,400 for flood control work during the fiscal year ending June 30, 1950. The funds were classified as follows: general flood control, $366,330,400; emergency fund, $2 million; lower Mississippi river, $67 million; Sacramento river, $3,600,000; Mississippi river emergency fund, $300,000. Of the flood control general fund, $518,381,090 was specified for new construction; $3,210,000 for advance planning; and $5 million for preliminary examinations, surveys and contingencies. Exclusive of the lower Mississippi river and the Sacramento river, flood control construction was continued or begun on 165 projects in 37 states and in Alaska. The $67 million allotted the lower Mississippi river project was designated for work in seven states: Kentucky, Illinois, Tennessee, Louisiana, Missouri, Arkansas and Mississippi.

At the end of June 1949, a total of 256 flood control projects was in operation; 30 were new. Construction was continued on 98 projects, of which 43 were reservoirs and 55 were of a local character, such as levees, flood walls, channel improvements, etc. Construction was begun on 34 new projects, 9 of which were dams and reservoirs.

Reservoirs placed in operation during the fiscal year included the Union Village reservoir, Vermont; the Tully reservoir, Massachusetts; the Addicks reservoir, Texas; the Hords Creek reservoir, Texas; and the Wister reservoir in Oklahoma. Local protection projects placed in operation included projects at Nashua, New Hampshire; Holyoke, Massachusetts; Springdale, Massachusetts; the Conway county levee districts numbers 1, 2 and 8, Arkansas; the McLean Bottom levee district number 3, Arkansas; the Henderson county drainage district number 3, Illinois; projects at Tucker Lake, Arkansas; Cincinnati, Ohio; Aten, Nebraska; Hot Springs, South Dakota; the project at the mouth of the Sangamon river, Illinois; the projects for the Owasco inlet and outlet, New York; Lancaster, New York; Pajaro river, California; the Mill Four drainage district, Oregon; and projects at Indianola, Nebraska; Elkins, West Virginia; Tacoma, Washington; and Taylorsville, Kentucky. Congress in the first deficiency appropriation act of 1949, enacted on May 24, provided funds of $14 million for general flood control projects. The second deficiency appropriation act of 1949, approved on June 23, 1949, $500,000 was made available for prosecution of the work on the Fort Worth floodway on the Trinity river in Texas. On Oct. 10, 1949, the president signed another appropriation, which provided, among other things, $76,000 for the modification of the project at Mandan, North Dakota.

Channel improvement of the Mississippi river proper was continued during 1949 at a number of places below Cairo, Illinois. Completed levee construction totalled approximately 1,500 mi. of main stem levees, extending from near Head of Passes, Louisiana, to Rock Island, Illinois. Co-ordinated with the main stem levees were 1,000 mi. of tributary levees, practically completed in 1949. Below Cairo, work continued on river bank protection. Revetment was carried out on more than 100 mi. of river bank; in addition, many miles of permeable dykes were in place for bank stabilization and channel regulation. The substantially completed 2,500-mi. levee system now contained more than 1,200 million cu. yd. of earth; it was called the largest earth-moving project in history.

Damaging floods occurred in New England in the Connecticut river valley during the closing days of Dec. 1948, causing damages running as high as $7 million and claiming the lives of five persons. Disastrous as the floods were, however, the flood control works that had been completed and were in operation prevented damages estimated at $11 million.

Damaging floods also occurred along the Potomac river in Virginia and West Virginia during June 1949. Rain fell with such intensity that communications were disrupted before warnings could be sent. Eleven lives were lost and the total damage in Virginia was estimated at more than $3 million and in West Virginia at $6 million.

In Jan. 1949, minor flooding occurred on the Grand (Neosho) river from Oswego, Kansas, to Pensacola reservoir and on the Verdigris river from Inola, Oklahoma, to the mouth. Major flooding occurred on the Poteau river from Cauthron, Arkansas, to Wister reservoir, with minor flooding from Poteau, Oklahoma, to the mouth. Major flooding occurred on the Kiamichi river and on the Little river and its tributaries, while moderate floods were experienced on the Red river at Fulton, Arkansas.

During the early months of 1949, a great amount of snow covered the Missouri river basin, causing some flooding of...
major streams and their tributaries. However, if the plains states had experienced flood-producing weather in the spring, record flooding might easily have occurred. Fortunately, rapid thawing and heavy rainfall did not occur to make the threat a reality.

(G. Hb.)

**FLOUR.** In 1949 there was a tendency in most countries for the flour extraction rate to be lowered and hence for the public to have a whiter and generally more appetizing flour. Although in Great Britain the extraction rate remained at 85%, Table I indicates the general world trend and also gives information on the quantities of bread grains used per person in the principal countries.

(a) Unreported, but for 1948-49 blanks would probably be less than for 1947-48 and for 1947-48 blanks would not likely be less than for 1948-49.

Actual consumption figures of flour or bread per person were not available but were substantially controlled by the prevailing extraction rate.

In Great Britain the first six months of 1949, the flour sold was 1,579,300 tons for manufacture (corresponding to 2,143,300 tons bread) together with 253,700 tons of flour sold for household requirements. The miller’s gist naturally varied throughout the year but always contained an appreciable proportion of strong Manitoba wheat together with nearly as much home-grown wheat, the whole being supplemented with some Argentine and Australian wheat.

The principal exporting countries were the United States, Canada, Argentina and Australia and besides the usual channels there were heavy clearances of the surpluses to Germany, Italy and India. In April 1949 an international meeting agreed export quotas. Allowing for the amount of home-grown wheat, the 1949-50 season for international trade in wheat and flour was likely to take place within the framework indicated in Table II.

Feeding tests made on German girls produced rather surprising results. Groups of girls had their rather inadequate diet supplemented with bread made from various types of flour such as short extraction (72%) white flour, 85% flour and wholemeal, but all the breads were equally efficacious in bringing about satisfactory growth and health. (D. W. K-J.)

**United States.** For the first eight months of 1949, wheat flour production amounted to 155,500,000 cwt., compared with 185,300,000 cwt. for the corresponding period of 1948. The peak production month for this period was January, with 22,380,000 cwt. compared with 24,400,000 and 28,190,000 cwt., respectively for the corresponding months of 1948 and 1947.

Net exports of wheat flour for 1948 amounted to 55,300,000 cwt., a decrease of 29,740,000 cwt. or 35% from 1947. The flour available for domestic consumption during 1948 was 201,700,000 cwt., an increase of only 4 million over 1947. This increase was a consequence of sharply reduced exports, which dropped 53.8% from 1947, rather than a result of flour production. (See Wheat.)

Investigation and tests conducted by the flour industry during 1949 revealed that no effect, toxic or otherwise, was obtained by the use of oxidizing agents, bleaches and related materials which were commonly used to improve the baking properties of flour.

The flour and cereal enrichment programme, widely accepted in Great Britain and continental U.S., was introduced in the Philippines, Cuba and Puerto Rico. In the latter country the enrichment of all white flour was made a legal requirement. (See also BREAD AND BAKERY PRODUCTS; WHEAT.)

**FLOWERS AND FLOWER FARMING:** see Horticulture.

**FOOD RESEARCH.** A clear illustration of the experimental production of hypertension and its relation to nutrition was given in 1949 by Drs. W. S. Hartroft and C. H. Best of Toronto. These investigators placed weanling albino rats on a diet low in choline, a member of the vitamin B complex, for periods of five or six days. Such brief periods of choline deficiency were sufficient to produce the typical "hemorrhagic kidney" in the young growing albino rat. Blood pressure determinations were made at intervals, and at the end of the experiment, histologic studies were made of both kidneys. The amount of kidney damage observed was classified as severe, moderate, slight or none. Ten of the survivors of the hemorrhagic kidney syndrome exhibited severe persistent kidney damage. All of these animals had definite arterial hypertension, the average blood pressure being 195 mm. of mercury. Thirteen of the survivors showed moderate residual kidney damage, with a mean blood pressure of 165 mm. Thirty-nine of the survivors showed only slight kidney damage and exhibited a mean blood pressure of 136 mm. For the 36 control animals, the mean blood pressure was 118 mm. In a study of agents which influence experimental radiation injury, A. Goldfeder, L. Cohen, C. Miller and M. Singer investigated the effects of dietary supplements of folie acid and of pyridoxine on the susceptibility of mice to radiation injury. These two vitamins were selected for investigation because the former was reported to be of clinical value in preventing nausea in X-ray-treated cases, whereas the latter had been of value in sprue and in the treatment of leucopenia, which suggested its application in relief of the diarrhea and leucopenia accompanying radiation sickness. The experimental studies with mice indicated that deficiencies of these two B-complex vitamins markedly increased susceptibility to irradiation injury.

**BIBLIOGRAPHY.** W. S. Hartroft and C. H. Best, "Hypertension of Renal Origin in Rats Following Less Than One Week of Choline
Vitamin $B_2$. Among the important accomplishments in nutrition research is the isolation of vitamin $B_2$, the recognition of its relation to pernicious anemia and the discovery of new uses for it. Dr. Randolph West, along with many others, embarked upon an attempt to concentrate the active principle from liver. After more than 20 years of search, in April 1948 the concentration of a reddish crystalline substance from liver was finally reported by an English worker named E. L. Smith. In the same month a group of American research workers headed by Dr. E. L. Rickes of the Merck Research laboratory also reported the isolation of a reddish crystalline compound which they called vitamin $B_2$. Both were found to be effective in the treatment of pernicious anemia. Simultaneously, Dr. West published observations demonstrating that exceedingly small doses of this newly isolated vitamin $B_2$ were effective in the treatment of anemia. Dr. Mary Shorb also reported that the material isolated by the Merck workers was an essential growth factor for Lactobacillus Lactis Dornier. Earlier she had shown that an "LLD factor" in refined liver extract bore a significant relationship to the effectiveness of extracts used in the treatment of pernicious anemia. The early clinical investigations of Dr. West with vitamin $B_2$ were confirmed by others and its usefulness in the treatment of other forms of macrocytic anemia was demonstrated in 1949.

Vitamin $B_2$ is a red crystalline compound. Its precise chemical structure was as yet unknown, but it was described as an organic cobalt-complex containing small amounts of nitrogen and phosphorus. It was presumed to have a molecular weight of about 1,500. Of interest was the fact that cobalt had been regarded, for some time, as an essential trace element in human nutrition. However, prior to the discovery of vitamin $B_2$, it was not demonstrated to be a constituent of any known nutrient. Vitamin $B_2$ was effective in the treatment of anemia in exceedingly small doses. Jones, Darby and Trotter currently reported that as little as 1.5 micrograms (0.0000015 grams) given parenterally could be effective. In what seems to be obtaining $B_2$ from human urine, it was fortunate that there were other sources including the Streptomyces griseus, from which streptomycin could be obtained.

FOOD SUPPLY OF THE WORLD. The world food situation became increasingly easier during 1949 and in a few sectors burdensome surpluses were emerging. In great contrast with the uneasy, if not actually dangerous, food situation of the world in the early part of 1948, the almost universally good harvests of that year were followed by increased food supplies in 1949 in all major regions except the United States and Canada. Prospects for meeting the effective demand for food in the 1949-50 consumption year were brighter than in any of the preceding postwar years, although a large proportion of the world's population nevertheless would not be and had not been adequately nourished by some standards. Food rationing and other restrictions were widely relaxed or abandoned. The improved situation was not so much the result of extremely large crops in one or two areas (as had previously been true as regards the U.S.) nor of the enormous output of one major crop, but rather a general improvement in the output of many categories, but particularly of bread grains, feed grains, fats and oils, and fruit and vegetables. Reserves of grain stocks in the four principal exporting countries on July 1, 1949, were 72-8 million tons, about 68% larger than the small stocks of the previous year. Livestock in Europe showed much improvement after the large harvests of 1948 and the increased abundance of coarse grains for import. Essentially 1949 was a year without famine; crops were not very poor in any large area; malnutrition was endemic but not epidemic.

In some exporting countries, particularly the U.S., there was some concern about the possibility of agricultural surpluses. Substantial reduction in planted acreage of wheat and corn crops to be harvested in 1950 were ordered in the U.S. Government storage programmes were expanded and exports subsidized.

* Preliminary estimate

**Bread Grains, Wheat and Rye.** World bread grain production estimates for 1949 were lowered during the year as additional information became available; near the end of the year they were estimated at 233 million short tons, slightly less than the 238 million tons of 1948 but a little above the average 229 million tons of 1935-39. The world wheat crop was finally placed at 6,185 million bu., a figure somewhat below the 6,385 million bu. of 1948 and moderately in excess of the 6,010 million bu. average for 1935-39. The decrease was primarily the result of decline in North American production, the U.S. producing 1,176,463,000 bu. in 1949, compared with 1,313,534,000 bu. in 1948. The Canadian crop was about 25 million bu. smaller than the 1948 harvest but approximately 50 million bu. in excess of the prewar average. The U.S. crop was the sixth consecutive crop of more than 1,000 million bu. but almost 250 million bu. below the record, although about 400 million bu. more than the prewar average.

The world rye crop of 1949 totalled 1,655 million bu., as against 1,665 million bu. in 1948 and 1,730 million bu. prewar average (1935-39). The increase was large in Europe, which produced 705 million bu. in 1949, compared with 660 million bu. in 1948, but 765 million bu. average prewar. North America produced only about half as much as in 1948.

The abundant bread grain crops of 1949 were particularly important in assuring the continuation, if not the improvement, of the diet of western Europe and in providing stocks for export from the chief exporting countries to the densely populated deficit areas of Europe and Asia. But as reserve stocks became more abundant fears of an unmanageable surplus began to grow in exporting countries. Although
winter wheat sowings in the U.S. were, by official order, only 85% of the record acreage seeded in the autumn of 1948, the condition of the new crop was excellent and initial indications were that the prospective harvest might be nearly as large as in 1949. Rye acreage was expanded 12% and the condition was excellent. Reports on the new crop in Europe were favourable.

Other Grains. A major difference in the world food supply in 1949, in contrast to the immediate postwar years, was the relative abundance of grains for cattle feeding, a situation largely accounted for by the record corn (maize) crop of the U.S. in 1948, from which there was a record reserve after the large 1949 crop. The 1949 crop of 3,377,790,000 bu. plus a reserve of $15,376,000 bu. gave a new record total supply. The corn (maize) crop for the world amounted to about 5,680 million bu., second only to the record crop of 5,990 million bu. in 1948-49 and much in excess of the prewar average of 4,750 million bu.

Other feed grains, oats, barley and grain sorghums, yielded abundantly in 1949, although not up to the 1948 level. The world oat crop was estimated at 3,980 million bu., as compared with 4,200 million bu. in 1948. Europe’s 1,375 million bu. was slightly more than in 1948, but nearly one-fifth less than the prewar average. The world barley crop was estimated at 2,250 million bu., compared with 2,380 million bu. in 1948 and about 100 million bu. less than the prewar average.

The significance of these cereals which are not widely used for bread lies partly in their service as reserve stocks against human starvation but more especially in their indirect use as concentrated livestock food in the continuing expansion of meat and livestock production. Whereas in 1947-48 imports of feed grains into Western Europe were very modest because of short supplies in exporting countries, exports from the U.S., mostly to Western Europe, during 1948-49 of feed grains were large and expected to be still larger in 1949-50.

Rice. The world’s greatest food crop for direct human consumption, in terms of the number of people preferring that crop, is rice. In terms of total world production, it had not regained its prewar level; the estimated crop was 144.2 million metric tons (paddy) in 1948-49, compared with 142.5 million tons in the previous year and approximately 147 million tons in the prewar period. Nearly 95% of production was in Asia. The U.S. crop of 89,141,000 bu. was a record one and acreage was to be reduced in 1950. The distribution of production of rice in relation to consumption was very different from the prewar period and world trade in rice was only about 40% as large. In particular, the major exporting areas of southeast Asia, partly because of somewhat smaller production but mainly because of political disturbances, transportation difficulties and increased consumption by the producers, did not provide the usual export quantities for the densely populated deficit rice-consuming areas of the far east. To some extent this gap was filled by wheat and other grains from Australia and the Americas; the U.S. exported 64.2 million bu. of wheat to Japan and Korea in 1948-49. The suggested allocation of rice under the International Emergency Food Council in 1949 amounted to only 3,813,000 metric tons. Nevertheless, the situation was more favourable: Japan harvested an estimated 599,105,000 bu. crop, compared with 586,004,000 bu. in 1948; production and export from the surplus areas of southeast Asia seemed to be rising and prices appeared to have stabilized.

Potatoes. The 1949-50 crop was about 8,000 million bu., compared with 8,764 million bu. in 1948-49 and 8,300 million bu. average in the prewar years 1935-39. The European crop (excluding the U.S.S.R.), in particular, declined sharply to 4,414,363,000 bu., compared with 5,054,390,000 bu. in 1948, and was about 10% below prewar. The U.S.S.R. crop was indicated at 2,800 million bu., a little below 1948 but slightly above prewar. The Canadian crop, as well as that of the U.S., was smaller, although still abundant in relation to demand. Acreage was increased in Europe, but yields per acre declined to 180 bu., compared with 210 bu. in 1948 and 200 bu. prewar. In spite of larger acreage and smaller crops in the U.S., the 1949 crop nevertheless was excessive and the government subsidy programme involved $50 million to $60 million. Although this was much reduced from the 1948 crop, the official goal, for the 1950 crop was set still lower at 335 million bu.

Sugar. World production of beet and cane-sugar for the 1949-50 season was estimated at 36,646,000 short tons, raw value, 2% less than the record crop of 1948-49 of 37,249,000 tons, but about 6% more than the prewar (1935-39) average of 34,718,000 short tons. World beet sugar production, largely in Europe, increased to 11,362,000 tons, compared with 11,071,000 tons in 1948, but continued below the 12,025,000 tons of prewar. Meanwhile, world cane sugar production of 25,284,000 short tons was about 900,000 tons less than the record large crop of the previous year. Increases in the Philippines, the U.S.S.R., the U.S., Argentina and several European countries failed to offset the decrease in Cuba and some other areas; Cuba declined to 5.3 million tons from a record of 6,675,000 tons in 1947. Consumption continued to vary very much from the different countries, ranging from 93.3 lb. per capita in the U.S. in 1949 to only a very few lb. per person for more than one-half the world’s population.

Meat. The meat supply situation was generally easier in 1949. Pork, poultry, and fish were in more abundant supply and prices were lower, whereas high quality beef and lamb were relatively scarce and prices continued high. Total meat consumption per person in the U.S. was expected to be about 150 lb., compared with 147 lb. in 1948, a record of 155 lb. in 1947 and a prewar average of 126 lb. Lamb consumption, however, was only 90% of 1948, whereas 10% more chickens and turkeys were consumed than in 1948.

Due to improved feed conditions in 1948 and continuing favourable production in 1949, output of meat increased in 1949 in all major producing areas, although in Europe it was only about 75% of prewar; in spite of large increases in some areas, the world total was still below prewar. Milk cows, however, were given special consideration and world cattle numbers, for beef as well as milk, were placed at a record of 761 million head at the beginning of 1949. Meat exports from Argentina, Canada, Australia and New Zealand continued in fair volume to western Europe, particularly to the United Kingdom.

Fats and Oils. Expansion in the production of most kinds of fats and oils continued in 1949, with a consequent easing of the supplies in the price level. Although significant differences existed among areas and types, the overall supply approximated the prewar level. On a population basis the supply continued below prewar, Germany and Japan being especially low at a consumption level of about half that of prewar. Production of fats and oils in the U.S. set up a new record of about 12,010 million lb. as a result of the large 1949 crops of soybeans and cotton as well as a large pig crop. Palm oil and coconut oil also became available in larger amounts from tropical areas. The olive oil crop of the Mediterranean basin was abundant. As a result, world exports of this composite food item were expected to be as much as 10% larger than in 1948. Exports from the U.S. were especially large, reaching a record of 2,100 million lb. in 1948-49.
FOOTBALL

Food Prices and Trade. The decline in food prices continued in 1949. Food prices, particularly those of food raw materials such as grains and fats and oils, which reached their postwar peaks in the free markets of the world early in 1948, subsequently declined sharply but irregularly. Prices of meat and livestock products resisted the decline to a certain extent. The over-all decline amounted to 10%–20% with a few items showing extreme declines of one third to one half of their former peak levels. As a result, although prices on the retail level were much less abrupt and were smaller, black markets in food practically disappeared, rationing and other restrictions were removed in most countries and a buyer's market began to appear.

Because of their cheapness, easy storage, availability and widespread acceptance, grains continued to be the main food import and export in world trade. In 1948-49, world exports of grain and grain products reached 36.2 million tons, compared with 35.6 million tons in 1947-48, and the largest since 1931-32, but still less than the record 40.6 million tons moved in 1928-29. Of the 1948-49 total, 26.6 million tons were wheat bread grains, and 9.6 million tons were feed grains. In 1948-49 (mostly from 1948 crops), grain supplies were still in hand at the end of the period, and principal exporting countries increased 68% as compared with 1947-48. For the first time since before World War II, exportable supplies were in excess of the provisional import programmes. In fact, there were signs of trouble ahead in the efforts of most countries to restore or exceed prewar production and to reduce imports, particularly from hard currency areas.

Estimated exports in 1949 included sugar to about 10 million short tons, of which more than 80% came from the western hemisphere, compared with less than 50% before the war. World supply and demand continued to balance. Prices were sluggish and slightly down compared with 1947.

* Preliminary estimate

Food Situation by Areas. European food production in 1949 was not quite so large as in 1948. In Europe the 1949 cereal harvests averaged some 5% below the previous year, the western and southern portions in particular dropping below the previous year. Potatoes were lower, but sugar increased, as did fats and oils and livestock and dairy products. However, the domestic food supply of Europe in 1949 was still somewhat lower than the prewar level, and population had increased. The major food item, bread, was about 92% of the prewar average. Domestic supplies of meat, dairy products and poultry were still less compared with the period in the four years. Nevertheless, the situation had relaxed sufficiently to allow the derationing of bread, lowering of the flour extraction rate and reduction or discontinuing of the mixing of coarse grains in bread flour. Stockpiles of grains were increased. A disturbing feature was the extent to which the world import requirements of food, particularly into Europe, had come to depend so overwhelmingly on the vast but unstable production of North America. The occupied area of Western Germany was reported to have a volume of food production in 1949 some 29% larger than in 1948.

The food situation in the U.S.S.R. appeared to be more favourable than at any time since the war, whether judged by exports, observers' reports or rationing, but there were reports of delays in harvesting due to excessive rains and delays in compulsory deliveries. The 1949 grain crops of India and Japan were slightly better than in 1948. The situation in China was less clear because of the civil war. Natural conditions for the rice crop, the major cereal item of the diet, were at least as favourable as in 1948. Civil disturbances in Burma continued to restrict the movement of the 1948 rice crop and the production of the 1949 crop. Supplies available for export from French Indo-China continued to be small, although some increase occurred in the Siamese crop. Japan made further progress in agricultural rehabilitation, and in the rice collections.

Food crops in the southern hemisphere harvested during 1948-49 were more than average, particularly in Australia and Argentina; reports of a serious drought in South Africa indicated probably less favourable results there. Exportable supplies of dairy products had increased in Australia and New Zealand, and there were also moderate increases in meat supplies from some countries in the southern hemisphere. Inadequate incentives, in terms of prices paid, apparently continued to be a drag on production in some areas, especially in Argentina, and late in 1949 the government announced higher grain prices.

The world food situation, both as to production and consumption, was excellent in North America in 1949, partly because of the nearly record crops but also because of an increase in livestock and their products. Crops in the U.S. yielded 148% of prewar (as compared with 154% in 1948), and livestock production was 133% of prewar. Canadian crops also were less than in 1948; and Canada began to search for wider markets for its exportable foods, even in the U.S., in the face of a drop in its contracts with the United Kingdom.

World Food Organization. The United Nations Food and Agriculture Organization (F.A.O.) continued to occupy the centre of the international agricultural stage during 1949. Its fifth annual conference of the 62 member countries was held in Washington, D.C., during Nov. and Dec. 1949. During the year, Norris E. Dodd of the U.S. continued as director general. Lord Boyd-Orr, (q.v.), the former director general, was the 1949 recipient of the Nobel Prize for Peace. A decision was taken to move the permanent headquarters to Rome, Italy. Two other major matters were considered. As regards technical assistance on agricultural matters to those nations requesting such help, the importance of providing technical advisors and extension services was emphasized, and priority on proposed projects was to be given to measures likely to secure an early increase in production of food and other requirements of local populations. The other matter was the consideration of the report on world commodity problems proposing an International Commodity Clearing house, which would purchase surplus supplies of food in exporting countries and dispose of them among under-supplied countries having inconvertible currency difficulties. Instead, a Committee on Commodity Problems was set up with recommendations to act on an individual commodity basis.

Among other international food activities during 1949 was the ratification of the International Wheat agreement which might be the forerunner of other commodity agreements. (J. K. R.)

FOOTBALL. Rugby Union. For the second year in succession Ireland in 1949 carried off the international honours, though their display in the opening match against France in no way suggested that they would. But after that initial defeat by a French side at the top of their form, the Irishmen pulled themselves together and beat all their "home" opponents. The strength of the champions lay in their splendid team work, the continued brilliance of J. W. Kyle (Queen's university), the outside half, and the discovery of a new fullback in G. W. Norton (Bective
FOOTBALL

Rangers). Of the 41 points that Ireland scored in the championship matches, Norton’s place-kicking provided 26. He was an experienced footballer, though this was his first appearance in International games.

Next in the championship table came England, France and Scotland, with two wins out of four games, and Wales figured at the bottom. Anything more topsy turvy than these final placings could not be recalled for a long time: Wales opened the internationals with a magnificent win over England at Cardiff, and the whole side played really sparkling football. From then on they went from bad to worse, their poorest game being that against Scotland at Murrayfield, Edinburgh. Here Wales had the ball four times out of five throughout the whole of the match, were continuously attacking and yet lost. Much credit was due to W. I. D. Elliott and D. H. Keller, an Australian player in the previous season’s touring side, who actually captained Scotland throughout the 1948-49 season and whose marking from the back row of the scrum was superb. But the faulty tactics of the Welshmen made it all much easier than it should have been. Scotland had unexpectedly beaten France in Paris in the opening match. But their play was never so good again; and, though they beat Wales at Edinburgh, they looked only a moderate side. England were surprising the other way round. They lost the two opening matches against Wales and Ireland, both away, though the side fought pluckily. Then with some delightful football England proceeded to win both the games at Twickenham, France being beaten by 8 points to 3 and Scotland by 19 points to 3. Much of the credit for this improvement must be given to Ivor Preece (Coventry), who took N. M. Hall’s place at outside half after the first two matches. Preece inspired the side with his vigour and enthusiasm and was greatly assisted by his two centres, C. B. Van Rynveld (South Africa and Oxford university) and L. B. Cannell (Northampton and Oxford university). Cannell’s try against France in the first two minutes of the game was one of the season’s greatest thrills, and Van Rynveld’s consistently good form, his try against Ireland and his two tries against Scotland were great helps to his side.

A great international figure disappeared from the game at the end of the season—Haydn Tanner, a scrum half-back who began playing with the famous Swansea club in 1935 and joined Cardiff after World War II. He had 25 full Welsh caps, to say nothing of dozens of other representative caps in and soon after wartime, and was undoubtedly the outstanding Rugby player of the late 1930’s onwards.

Taking the game as a whole, the standard was not particularly high, much of it being marred by an excess of ‘spoiling’ tactics by wing forwards, by poor passing and by a tendency on the part of midfield players to kick too much.

Lancashire won the county championship for the third time running, Gloucestershire once again being runners up. The champions were led by their famous captain, J. Heaton, up to the semi-final and the final. But in those two matches injuries kept him out of the game, and afterwards no more was seen of one of the finest centres Lancashire (or any other county) had ever had. The winning county owed a lot to G. Rimmer, their scrum half, the embodiment of pluck and persistence. He played for England in the first two matches of the season. The Oxford v. Cambridge match in Dec. 1949 was won by Oxford 3—0. Other competition winners in 1949 were: Services tournament, Army and R.A.F. tied, the Navy losing both their matches; Hospitals cup, St. Mary’s beat Guy’s; Middlesex seven-a-side, Heriot’s beat London Scottish; Rosslyn Park public schools seven-a-side, Stonyhurst beat Taunton; Hawick won the Border League championship and headed Scottish club records with three defeats only.

Rugby League. In international Rugby League football, a young Australian side came in 1948 for the first half of the season, the last test being played in Jan. 1949. The visitors lost all three, and except in the first match, which they lost by 21 points to 23 at Leeds, they were outplayed as well. The ‘home’ international championship is played between England, Wales and France, each country playing the other two home and away. For 1948-49 France headed the list, losing only to England at Bordeaux. Many of the well known players continued to hold their places in the English side, and it was interesting to see that the four threequarters for Great Britain against Australia were the same in all three matches—J. Lawrenson (Wigan), H. Pimblett (Warrington), E. Ward (Bradford Northern, captain) and S.McCormick (St. Helens). G. Helme (Warrington), scrum half, played in all the matches, as did K. Gee (Wigan), J. Egans (Wigan), G. Curran (Salford), R. Nicholas (Huddersfield) and D. Valentine (Huddersfield) among the forwards.

Never was so much interest taken in the game. Attendances in 1949 beat all records with 95,000 at Wembley for the challenge cup final, 64,000 for the semi-final at Bradford and 75,000 for the league club championship at Manchester. At Wembley, the finalists were Bradford Northern and Halifax, and the play was most disappointing. It was a good back division side (Bradford) against a good forward side. But it was all very dull until the Bradford backs did get going late in the game and scored three goals and two tries to nil. E. Batten and T. Foster scored the tries and Ernest Ward, the captain, kicked all the goals. The club championship was much more worthy of the game. Here two of the most consistent teams of the year, Warrington and Huddersfield, were pitted against each other at Manchester. The football was of the highest class and the enthusiasm tremendous. Warrington, the leaders of the league table, were expected to win but they lost by a single point—12 points to 13. Huddersfield scored tries through J. Daly, L. W. Cooper and P. C. Devery (captain) who kicked two goals as well, and H. Palin, the captain, and Jackson (tries) and Palin and H. Bath (goals) scored for the losers.

Association. Though the attendances at matches were greater than ever and the transfer prices for players were of record dimensions (Derby County paid £24,000 to Manchester United for J. Morris), the standard of English international football was disappointing. In the great game of the year, that between England and Scotland, England were well beaten at Wembley. That was, as usual, in March. Two months later when the England side went on their customary continental tour, they were again outplayed, this time by Sweden at Stockholm. In a way this was ignominious, for for there is nothing like so much football played in Sweden as in Great Britain and it is all amateur. In the game against Scotland at Wembley, the visitors gave a brilliant display in the second half, after a first half in which the goalkeeper, Cowan (Morton), had saved his side time and time again.

Then, with that great player Young (Glasgow Rangers)
FOOTBALL

dominating his side's defence and W. Waddell (Rangers) and W. Steel (Derby County) indulging in skilful and persistent attacking. Scotland deservedly won by 3–1, thus taking revenge for England's victory at Glasgow the year before. Scotland were undisputed champions, for they won all three matches, beating Wales at Cardiff 3–1 and Ireland at Glasgow 3–2.

F. Swift was still in goal for England, W. Wright and N. Franklin in the half-back line and S. Matthews, S. Mortensen and J. Milburn among the forwards. But in one or two cases, Swift and Matthews for example, there were signs that their best days were over.

The Football Association cup final at Wembley was played between Wolverhampton Wanderers and Leicester City. The Wolves looked like getting there from the very start; for here was a beautifully balanced side, playing with skill and vigour and including in Wright, J. Pye and J. Hancock some of the best players in the country and in S. Cullis, a former great player and now a great manager. Leicester City did wonderfully well to beat Portsmouth, one of the teams of the year, in the semi-final, and actually put up a better fight in the final than was expected. In the end, however, they were beaten 3–1. The Duke of Gloucester was present and handed the cup to the Wolverhampton captain. The Scottish cup was won by Glasgow Rangers who beat Clyde 4–1. The English league championship was won by Portsmouth, and their form all through the season had been consistently splendid. It looked at one time as though they would carry off the cup and the championship, a feat that had only been performed twice: by Preston North End in 1889 and by Aston Villa in 1897. But Leicester City most unexpectedly won the semi-final against them. Local enthusiasm, excellent team spirit and much skill carried Portsmouth to the top, where they finished 5 points ahead of Manchester United, after having maintained an unbeaten home record. The other division leaders were Fulham, after a terrific fight with West Bromwich one point behind and Southampton one point behind the Albion, in the second division; Hull City were clear away in division 3 (North), and Swansea Town 7 points ahead of their nearest rivals in division 3 (South). Thus, in the always interesting re-shuffle at the end of the season, Preston and Sheffield United went down to division 2 and Fulham and W.B. Albion took their places. Notts Forest and Lincoln City went down from division 2 to division 3. The Scottish league championship was won by Glasgow Rangers with Dundee as runners-up.

Once more J. Carey, the Manchester United and Ireland captain, was a dominating figure in the game, and had the tremendous pleasure of leading an Eire side against England at Everton early in the 1949-50 season and beating the team of all the talents fairly and squarely, to most people's consternation. Dickinson was one of England's most promising players. He was a left half and helped as much as anybody to get Portsmouth to the top of the tree. Steel maintained his form and was one of the game's greatest inside forwards. In the amateur world, amongst the international matches honours were fairly even. The university match was one of the best ever played between Oxford and Cambridge. In the end Oxford won by five goals to four. The F.A. amateur cup final was played at Wembley for the first time in the history of the tournament and there were 95,000 people present, which meant that the match would probably now always be played at Wembley. It was a dour game, with little in it between the sides. But what little there was was undoubtedly in Bromley's favour, and they beat Romford 1–0.

United States. Notre Dame, Oklahoma, California and Army were ranked as the four top college football teams of the United States in 1949. Behind these four teams in the nation-wide poll were Rice, Ohio State, Michigan, (the 1948 leader), Minnesota, Louisiana State and College of the Pacific.

College football enjoyed its customary popularity while professional football was suffering a marked drop in attendance. Although there was a slight drop in the east and on the Pacific coast, attributed to the televising of games, the college figures for the country as a whole were even higher than in 1948.

Controversy over the use of the "platoon" system, which many of the leading teams used, continued throughout the season. The employment of separate offensive and defensive units was decried by some of the coaches and there was considerable criticism of it in the press. It was argued that teams with large squads had an unfair advantage in their ability to make wholesale substitutions against opponents who lacked the manpower to do so. The majority of the coaches, however, appeared to be against any change in the rules that would restrict substitutions.

In professional football the expensive four-year war between the National league and the All-America conference came to a sudden end shortly before the Philadelphia Eagles and the Cleveland Browns were again established as the champions of the two leagues. Ever since the conference had started operations in 1946 to compete with the older organization for the public's support, the two leagues had gone their separate ways, refusing to get together on schedules. As a consequence professional football became an increasingly losing proposition for all but a few clubs.

The settlement of the two leagues' differences called for the formation of a new 13-club league, to be known as the
National-American Football league. All ten clubs operating in the National league and three from the conference were to be included. The new league was to be divided into divisions, National and American, and the winners in each were to meet in a play-off for the world championship, comparable to the world series in baseball.

Canada. The Grey cup, emblematic of the dominion football championship, returned to Montreal for the first time in 18 years as the Alouettes of that city defeated the Calgary Stampeders, 28-15, before a capacity crowd of 20,100 at Varsity Stadium in Montreal. The University of Western Ontario defeated McGill university, 12-9, to win the championship of the Intercollegiate Rugby Football union.

FORAGE CROPS. The 1949 season was poor for all forage crops except hay. Grassland was affected in two ways. With so little rain, pastures dried out rapidly and by June farmers were reporting shortage of grazing. Pastures were stocked much more heavily than before World War II and this loss of grazing caused great difficulty, especially to dairy farmers. The season continued dry through September but with rain and mild weather in October pastures rapidly made some growth and stock improved in condition. Grasses undersown in a cereal crop in spring 1949 suffered severely and even in early October it was difficult on many fields to decide whether sufficient plants of sown grasses and clovers had survived to make a successful pasture. Farmers were consequently reluctant to plough up established pastures which might produce an adverse effect on the area of those crops, especially wheat, which normally follows ploughed pasture. Farmers who had established lucerne found it very valuable since its production was much less affected by the drought than that of pasture.

Feeding stuff for winter feeding continued to limit livestock production. Conservation of grass consequently received increasing attention, and the possibilities of reducing the cost of grass drying and the cost and reliability of silage-making received close study. Grass drying was not primarily carried out by producers for their own use; it was estimated that in 1948 about two-thirds of the production of dried grass was sold by the driers. The experiment in co-operative grass drying begun by the Milk Marketing board in 1948, with 12 centres which ranged in output from 540 to 1,200 tons, was continued in 1949. The form of contract with farmers was, however, modified to secure more efficient management, and attempts were made to retain a nucleus of trained staff through the winter.

The Committee on Industrial Productivity, in their first report (Cmd. 7665, H.M.S.O., London, 1949), placed great emphasis on the improvement of grassland as a means of reducing national reliance on imported feedingstuffs and proposed a target of 20% increase in output from grassland within four years. They stressed the great response made by grassland to nitrogenous fertilizer in relation to the estimate that not more than one-quarter of the grassland in the United Kingdom received it.

FOREIGN MINISTERS, COUNCIL OF: see Council of Foreign Ministers.

FORESTRY. A national census of the forests and woodlands of Great Britain was completed during 1949. The lack of reliable data on the areas and composition of British woodlands had long been recognized and a census was already in progress in 1939 when war intervened and the work was not begun again until 1947. Information now available showed the small area existing of productive woodlands in Great Britain compared with other European countries and also the great devastation caused by wartime fellings. Only 5% of the land surface of Great Britain was classified as forest land and this constituted of nearly three million ac. of privately owned woodlands and half a million ac. of state forests.

More than one-third of this total woodland and forest area was unproductive, having been clear-felled during the two world war periods and not yet replanted.

The various legislative enactments made to remedy this deplorable state of British forestry did not yet show much effect. The ambitious programme of state afforestation, to bring the total area of forests up to five million ac. at the end of 50 years, had begun to give important results and the annual fall of timber figures were almost reached again in 1949, but in the great effort to get large areas planted it was considered by some forestry experts that insufficient attention had been paid to the best ecological relation between the species of trees planted and the appropriate sites. The grant of financial assistance to private owners, under certain conditions, known as the “dedication” scheme, made little progress and a small increase in the planting grant per ac. together with new supplementary grants for the thinning of plantations were made during the year to stimulate dedication and to encourage private forestry.

Owing to the shortage of imported timber, excessive fellings in home woodlands continued after World War II and the existing controls had to be tightened by a considerable reduction on the amounts of timber licensed.

Serious insect damage was reported during 1949 from several regions. This was probably chiefly due to the lowered resistance of the trees caused by the prolonged drought, especially in the south of England. In south Wales increased infestation was said to be due to insects imported with pitprops and other round timber from France and Germany.

The British Forestry commission and the Colonial Forestry service both considerably increased their staffs during the year by the recruitment of forestry graduates from the universities. The five postwar forestry schools for the training of woodmen and foremen in Great Britain also produced their first large batches of qualified men in 1949 and most of these men obtained state or private forestry appointments. The chief subjects of forestry research were the afforestation of peat and heath moorlands, the maintenance of fertility in nurseries and the study of the numerous varieties and races of poplars.

Commonwealth. In the Commonwealth the heavy postwar demand for timber intensified the search for new sources of commercially useful timber; and formerly inaccessible areas were opened up by modern mechanical methods of logging and the construction of extraction roads.

In British Guiana and in west Africa important projects were made for more extensive use of the forests, and new sawmills and plywood factories were placed under construction. In east Africa some of the plantations formed before the war began to yield their first crops of sawn timber. The construction of a pulp mill was put into effect in Basutoland and a wattle bark factory in Tanganyika.

In Malaya the unsettled state of the country hindered forestry progress but an important development was the compilation by the forest department of new timber grading
rules. These rules, based on the ultimate commercial uses of the various grades of timber, created much discussion amongst foresters, timber importers and sawmillers, as the principles involved might be of great assistance in the grading and marketing of the lesser known species of tropical hardwoods not only in Malaya but in other parts of the Commonwealth.

One of the chief developments in the fields of forest utilization during the year was in the uses of wood waste products, from both sawmills and papermills and also from forest waste in the form of tree tops, branch-wood and bark. In Canada and in Scandinavia new fibre-board plants were constructed where sawmill waste was treated chemically and mechanically, the finished product being obtained by pressure at a very high temperature.

In Australia there was a great increase in the use of eucalyptus hardwoods for paper manufacture and 1949 saw the establishment of new pulp mills and a steady increase in the Australian output of high quality paper of all grades.

Europe. In European countries the disastrous fire in the pine forests of the Landes in southwest France was one of the most important events of the year. More than 360,000 ac. of valuable forests were destroyed, several villages devastated and over 80 lives lost. A national day of mourning was declared in France for the victims. The pine forests of the Landes are the greatest source of resin and terpine oil in Europe and the economic loss to France of such a large part of the forests was all the more serious owing to the great fires in the same area in 1944 and 1945.

In Germany and in Austria much progress was made in the regeneration of the forests over-felled during the war and postwar years, both by methods of natural regeneration and by the establishment of large nurseries for forest seedings and transplants.

In Belgium the afforestation of the Campines and other areas of poor soils continued, and a new research station was opened for the cultivation and study of hybrids of poplars.

A parasitic disease known as the Chestnut blight (Endothia parasitica) caused considerable damage and economic loss in Italy, and to a less extent in Portugal and parts of Spain. There are over two million ac. of chestnut forest in Italy, producing annually about 350,000 metric tons of chestnuts.

The wood is used for fuel and for construction but is chiefly important as the basic raw material for tannin. Direct measures to cure or prevent the disease were not effective and research was continued to find varieties of chestnut species resistant to the parasite.

(Philadelphia, Pennsylvania, July 1951)

United States. The U.S. Forest service issued in 1949 a comprehensive summary and analysis of the postwar forest situation in the United States. In this report it was estimated that the potential productivity of the nation's forest land was enough eventually to supply domestic needs, to provide for national emergencies and to help in some measure towards meeting the world shortage of timber. About one-third of the total land area was forest land, and some 461 million ac. were suitable and available for growing commercial timber. However, the supply of saw-timber was now steadily shrinking. More timber was being cut or destroyed each year than was replaced by growth. Timber quality was also deteriorating, the annual drain being principally in the better saw-timber, particularly softwoods, and the growth was in small, low-grade trees and inferior hardwoods.

Three-quarters of the commercial forest land was privately owned including generally the best growing and most accessible sites, but 64% of cutting on these lands was still poor or destructive and only 8% up to really good forestry standards.

If the nation's estimated future needs were to be met the annual growth of all timber would have to be increased by one-half and the present saw-timber growth rate doubled. The Forest service recommended: (1) a system of public regulation of cutting that would stop forest destruction and keep forest lands reasonably productive; (2) expansion and intensified management of public forests; (3) increased public assistance to private owners including increased protection against fires, and destructive insects and diseases, increased aid in reafforestation, a federally sponsored credit system to provide long-term loans, a federally sponsored insurance system to reduce the risks inherent in forestry enterprises, increased technical advice and assistance for small forest owners and expanded research in forestry and wood utilization.

In a proclamation issued on June 15, 1949, President Truman renamed the Colombia National forest the Gifford Pinchot National forest in memory of the pioneer American conservationist and the first chief of the United States Forest service. The formal dedication took place on Oct. 15 under the joint auspices of the Forest service and the Society of American Foresters, a professional organization of which Pinchot was co-founder.

This forest covered 1,250,000 ac., had a timber growth which was estimated to yield 200 million board ft. a year, in perpetuity and had many recreational and scenic attractions.

Fires burned many thousands of acres of forest and watershed lands in the western states during the late summer months of 1949, the worst being in the Helena National Forest, Montana, where 13 men lost their lives. The Forest service reported a total of 7,657 fires in western national forests between January and September compared with 4,031 in the same period of 1948.

The Anderson-Mansfield act passed by the United States Congress in 1949 authorized an accelerated programme of reafforestation and re-vegetation of forest and range lands in the national forests. The act provided for a 15-year programme with appropriations for reafforestation authorized in progressively increasing amounts from $3 million for the fiscal year 1951 up to $10 million for 1955 and each succeeding year until 1965. For range re-vegetation appropriations were authorized beginning with $1-$5 million for 1951 and increasing to $3 million between 1955 and 1965. The congress also passed legislation authorizing increased federal appropriations for co-operation with the States for the protection of state and private forest lands from fire and in the production and distribution of forest planting stock to private land owners.

(Philadelphia, Pennsylvania, July 1951)

United Nations. At the instigation of the Food and Agriculture organization of the United Nations, the third World Forestry congress was convened in Finland in July. Thirty countries sent official representatives and several international organizations were also represented, the total number of members of the congress exceeding 500. A wide range of forestry problems was discussed, including silviculture, forest surveys, economics and policy, forest utilization and wood industries. (See also National Parks; Soil Conservation; Timber.)

(A. H. L.D.)
History. As a result of the advances of Chinese Communist forces on the mainland, during 1949 Formosa was converted into a Chinese Nationalist military stronghold. Wei Tso-ming, former ambassador to the United States, was replaced as governor in Dec. 1948 by General Chen Cheng, former chief of staff of Nationalist forces in Manchuria. On Dec. 8, 1949, the capital of the Nationalist government was moved from Chengtu (see CHINA) to Taipei, capital of Formosa. On Dec. 15 Wu Kuo-cheng (K. C. Wu), former mayor of Shanghai, succeeded Chen as governor. At the same time Generalissimo Chiang Kai-shek appointed General Sung Li-jen military commander of the island.

At the end of 1949 Formosa was one of the two territories remaining in the control of the Nationalist government, the other being Hainan island. It was estimated that Generalissimo Chiang Kai-shek had on Formosa about 200,000 troops, an air force of some 250 bombers and fighters and a navy of about 150,000 tons consisting of destroyers and smaller vessels. There were also about 200,000 troops on Hainan.

Upon taking over the administration of the island, the Chinese issued a special currency for Formosa, the Taiwan dollar, based on the former Japanese yen notes. In July, 1948, the official exchange rate between Taiwan and Chinese National dollar was 1 to 1,130. In 1949 a new currency, the new Taiwan yuan, was issued and the Taiwan dollar was eliminated. In Nov. 1949 the total note issue amounted to N.T.Y. 144 million. It was reported that the gold and silver of the Nationalist government's treasury had been sent to Formosa during 1949.

Agriculture. The gradual rehabilitation of agriculture since the close of World War II resulted in large increases in production in 1948-49 although output was still below prewar levels. Estimated production (1948-49) of rice was 1,320,000 bbl.; oil, 250,000; coffee, 188,000; pineapples 17,600; bananas 85,800; oranges 32,450; tobacco 3,700; sugarcane 14,850; sisal 2,200. The cultivated area in 1949 was estimated at 2,055,000 ac. or 23% of the total land area.

Industry. Production (1948 in short tons, unless otherwise stated): coal 1,815,000; salt 396,000, copper 990,000; aluminum 2,750; cement 258,900; refined sugar 295,000; chemical fertilizers 42,100; paper 7,150; caustic soda 5,280; hydrochloric acid 3,410; bleaching powder 3,080; cotton yarn 884; cotton cloth 4,480,000 yd.; gold 12,200 Troy oz.; crude petroleum 36,000 bbl., refined petroleum 700,000 bbl.; electric power 832 million kWh.

Foreign Trade. Chief exports in 1948 were rice, sugar, coal, salt, cotton. Chief imports were raw cotton, rayon, and refined petroleum. Exports during 1948 amounted to the equivalent of U.S. $17,228,000, while imports totaled $4,786,000.

Transport and Communications. Railways (1946): govt., 981 mi.; private, 1,766 mi. Trunks (1946), 10,060 mi., including 2,200 mi. of main highways. In 1939 there were 220 telegraph offices, 195 post offices and 123 telephone exchanges.

(S. Nk.; X.)

FRANCE

FRANCE, a republic of western Europe bounded on the north by the English channel, on the east by Belgium, Luxembourg, Germany, Switzerland and Italy, on the south by the Mediterranean sea, on the southwest by Spain and on the west by the Atlantic ocean. Area, 217,727 sq. mi., including the Mediterranean island of Corsica (3,367 sq. mi.). Pop. (March 1946 census): 40,828,884 including members of armed forces, crews of the commercial navy aboard and the personnel of the military government in Germany and Austria; (Dec. 1949 est.) 41,800,000. Language: French is universally spoken but there are also other regional languages or dialects: German in Alsace and part of Lorraine; Breton in Brittany; Flemish in the northern corner of the North department; Provençal in the Alpes Maritimes, Basses-Alpes, Var and Bouches-du-Rhône départements; Catalan in Roussillon (Pyrénées Orientales); Basque south of Bayonne, and Italian in Corsica. Religion: mainly Roman Catholic with c. one million Protestants and over 225,000 Jews. Chief towns (pop., 1946 census): Paris (cap., 2,725,374; Marseilles (636,264); Lyons (460,748); Toulouse (264,411); Bordeaux (253,751); Nice (211,165); Nantes (200,265), President of the republic, Vincent Auriol (q.v.); prime ministers in 1949, Henri Queuille and (from Oct. 28) Georges Bidault (q.v.); minister of foreign affairs, Robert Schuman (q.v.).

History. The year 1949 passed off with much greater tranquillity than the preceding one. There was no repetition in 1949 of the big and partially violent strikes of 1948, much less of the greater violence of 1947. There was also a much greater stability of price level and no resort to such exceptional measures as the forced loan and the withdrawal of all 5,000 franc notes at the beginning of 1948. Interest in politics and in trade unionism certainly declined. Communist propaganda was increasingly concerned with "peace," by which was meant opposition to the E.R.P. and the North Atlantic treaty. By December the only rationed commodity was coffee; in the course of the year milk had once more become legally available to adults in towns and such small luxuries as croissants had reappeared. Many price controls however remained in force. In spite of them the tendency of the cost of living in the second half of the year was to rise. As compared with incomes, prices—though relatively stable—were high throughout the year. The fight to secure a balanced budget was not yet satisfactorily concluded, partly because of heavy expenditures in Indo-China and partly because so many of the biggest nationalized undertakings continued to have deficits. The more tranquil course of political life led to a weakening of the double pressure on the Fourth Republic from the Communists on the one hand and the Gauls on the other. But the working of the republic's machinery had not noticeably improved. The long premiership (by French standards) of Henri Queuille was in part achieved by an attitude that his critics described as "immobility" and on his resignation there were two false starts and an interregnum of over three weeks before his government could be replaced.

The Double Pressure Recedes. The prestige built up by the Queuille government during the Nov. 1948 strikes was reinforced by its two big parliamentary successes in December. The first was a vote of confidence by 377 to 181 in recognition of the government's vigorous protest against the Anglo-American agreement on the Ruhr. This protest, backed by unanimous French opinion, was the prelude to three-power negotiations which resulted in the creation of the Ruhr authority and the Office of Security. On Dec. 29 the French government congratulated Robert Schuman, minister of foreign affairs, on the results achieved. The government's second success consisted in inducing the National Assembly to approve by 341 to 231 an accelerated procedure for voting the budget, by which in the first instance only maximum figures of expenditure for the different ministries should be voted while the credits were to be examined in detail later. In this form the budget was finally voted on the night of Dec. 31, providing for ordinary expenditure of Fr.1,250,000 million and extraordinary (reconstruction and re-equipment) of Fr.615,000 million.

On Jan. 13 the government in fulfilment of its promises to stabilize, and indeed reduce, prices no less than wages issued a series of decrees and administrative instructions aimed at diminishing profit margins in industry and in the distributing trades—especially those of the middlemen dealing in farm produce, of which the prices to the producer were falling without proportionate advantage to the consumer. As on some previous occasions there was more talk of price reduction than was warranted by a situation in which it was

In Aug. 1949 widespread fires swept through the forests in the Gironde and the Landes devastating about 112,000 ac. of forest land. The photograph on right is of the pine forests of Facture.
already a great deal to have achieved stabilization. This naturally led later to some disappointment; but in spite of the scepticism of the general public the government achieved a creditable interruption of inflationary tendencies. On Jan. 21 the government announced the issue of a loan at 5%. Since purchasers of scrip for Fr. 100,000 were able to exchange for new scrip an equal amount of older loans issued at lower rates of interest, the interest of the new loan was really at between 6%–7%. At the beginning of March Maurice Petchesh, the minister of finance, announced that the loan had brought in Fr. 108,000 million in fresh money and that in consequence it would be unnecessary to impose any additional taxes in the current year.

The result of the loan was the more satisfactory in that both Communist and Gaullist propaganda against the government were of a character to discourage subscription. The government had had other difficulties. The minister of justice, André Marre, resigned on Feb. 13 when his health (undermined in a concentration camp during the war) collapsed after a running fight with Communists and Gaullists who alleged that a decision had been improperly taken not to prosecute a big building firm which had carried out important military contracts for the Germans during the occupation. Simultaneously the government was under constant pressure to prosecute Communist leaders for propaganda which by alleging that France was becoming the tool of U.S. aggressive intentions against the U.S.S.R., the true friend of the French people, was quite clearly intended to sabotage the integration of France into any western defence system. The government in fact only prosecuted some minor figures, being well aware that the speeches of leading Communists were much too cleverly worded to be actionable and that their words would have most effect if spoken from the dock. The Communists meanwhile had over-reached themselves by provoking Victor Kravchenko to a libel suit. The three months' trial was to end on April 4 in a verdict not altogether flattering though in principle almost entirely favourable to Kravchenko; very great damage was done to the reputation of the Soviet Union in France by the evidence given about conditions there (which the judge was to declare mainly irrelevant to the issue).

The Queuille government's prestige reached its height at the county council (conseils généraux) elections on March 20–27. These affected half the seats in every county council except that of the Seine (Grande Paris). According to the statistics of the Ministry of the Interior the Communists won 23·54% of the votes, as compared with 26·9% in the same areas in Nov. 1946, and the Gaullists, who had not existed as a party in Nov. 1946, won 25·34%. A generous computation could therefore attribute to the coalition parties 51·12% of the votes. Since the Seine département, where there had been no voting, was one of the areas where both Gaullists and Communists were strongest, since further it was impossible to disapprove of the government without supporting either of these parties, the claim of an absolute majority was somewhat specious; but the elections did clearly show that there were at least nearly twice as many people supporting or prepared to tolerate the present regime than there were in either organized bloc of opponents. It was no longer possible for either Gaullists or Communists to claim convincingly that parliamentary republicanism was the weakest political cause in France.

The Coalition Weakens. It might be that this success contributed to weaken the cohesion of the coalition when the National Assembly met after the Easter vacation. The government had the bad news for it that the budget was not as watertight as had been thought, and that the deficits of the nationalized undertakings were increasing. The Government hoped to meet the gap of Fr. 83,000 million by economies, including cutting down the investment programme and increasing the price of petrol. Queuille however could only induce the cabinet to agree on the proposals to be laid before the National Assembly when that body had already been sitting a week. The government had finally to abandon its own petrol proposals and accept those of the assembly, which proved in practice to be based on totally erroneous suppositions.

Meanwhile the rivalries between trade union federations were shaking the coalition. When the Socialist trade unionists left the C.G.T. (Confédération Générale du Travail) in Dec. 1947 and formed the "Force Ouvrière" trade union federation they had declared their aim was to improve the purchasing power, not merely the nominal wage of the worker. They had concentrated their attention therefore on bringing prices down. The stabilization of prices was not sufficient satisfaction for their troops. The F.O. trade unions were strongest amongst minor officials and "white-collar" workers, and largely unsuccessful in competing with the Communist organizations in the mines, heavy industry and the building trade. In the summer they felt it urgent to show that they were prepared to lead strikes, though they rejected all collaboration with the Communist-led C.G.T. The Catholic trade union federation (C.F.T.C., or Confédération Française des Travailleurs Chrétiens) was no less anxious than the Socialists to show that they were not the tools of capitalism. Possibly because they felt more sure of their troops, they declared themselves ready on occasion to co-operate with Communist trade unions. Both of these trade union federations began exerting pressure on their political friends in the coalition—Socialists in the one case, M.R.P. (Mouvement Républicain Populaire) in the other— to resist the tendencies of the increasingly dominant Conservatives. The F.O. civil servants' union called on June 15 a 24-hr. strike of government employees in support of a demand for re-grading (that is, in fact, salary increases) which brought work in a number of public offices to a standstill, though it did not affect the police. There were diversifications within the cabinet as to the attitude to strikes in the higher administrative levels; the Socialists had their way and there were no serious sanctions.

The government recovered prestige when Jules Moch, the Socialist minister of the interior, showed himself able to permit without disorder both a Gaullist and a Communist demonstration in close proximity on June 18. A very powerful police force was placed between them but on both sides there was an evident lack of desire for trouble. The Socialist party congress on July 18 approved of the maintenance of the coalition. Almost at once, however, divergent tendencies became apparent again when it was discovered that Daniel Mayer, the Socialist minister of labour, had granted holiday bonuses to the workers of the social insurance system, thereby setting a precedent for yielding to a demand which was being pressed in most branches of industry. The Conservative wing of the coalition protested that this was the thin end of the wedge of wage increases which would destroy the whole policy of stabilization.

The debate on the North Atlantic treaty (ratified on July 27 by 395 votes to 189) proved convenient cover for negotiations to hold the coalition together at least until the beginning of the summer recess. It was only by a majority of 289 to 230 that this was achieved before the National Assembly dispersed on July 31. It was hoped that, with parliament absent, the government would hold together. By the end of September there were increasing rumbles of wage claims and Daniel Mayer was advocating the payment of a bonus to the worst paid categories of workers. It was the backlash of British devaluation that finally made agreement within the Queuille

government impossible. The unexpectedly low dollar-sterling rate which the British government chose forced the French government to decide on a further devaluation of the franc which all plans had been made to avoid. The fear that this would mean a rapid increase in prices both stiffened the demand for a wage increase and the resistance to it of those who feared inflation. Queuille resigned on Oct. 5. The National Assembly was hurriedly summoned.

The Two Weeks' Crisis. On Oct. 8 President Auriol invited Jules Moch, the Socialist minister of the interior, to form a government. Moch, who was more respected than popular with those who appreciated his services to his country, was particularly hated by both Gaullists and Communists. After a violent all-night debate he was invested as prime minister on Oct. 14 by 311 votes, that is, by one more than the constitutional minimum. On the night of Oct. 17 he informed President Auriol that he could not secure the necessary agreement between the parties to form a cabinet. On Oct. 18 President Auriol asked René Mayer, a Radical, to present himself before parliament but, though he secured investment by 341 votes in the National Assembly, he also had to inform the president on Oct. 22 that he could not form a cabinet. This was due to his own party's objecting to Daniel Mayer remaining minister of labour and the Socialist party's refusal to co-operate on any other terms. Finally, on Oct. 23, the President asked Georges Bidault, the leader of the M.R.P. and former minister of foreign affairs, to form a cabinet. Although the country had remained astonishingly calm, almost indifferent, through this long interregnum, anxiety was beginning to grow and helped Bidault to secure investment on Oct. 27, by 367 votes to 183, with 53 abstentions. Only the Communists, led by Jacques Duclos (q.v.), voted against Bidault. Most prominent among the abstentionists was Paul Reynaud (q.v.) who during the crisis was stressing the necessity of a more dynamic economic policy.

Bidault formed his government on Oct. 28; Queuille remained in it as minister without portfolio, while Schuman kept foreign affairs, Moch the interior and Petsche the ministry of finance; Daniel Mayer declined office in order to facilitate the formation of the government and was succeeded by a fellow Socialist, Pierre Segelle; René Pleven, who had for long deplored the fierce opposition between the Gaullists and the parliamentary Republicans, became minister of national defence; René Mayer occupied the ministry of justice.

Bidault like his two unsuccessful predecessors had committed himself both to a non-recurring bonus for the lowest paid categories of workers and to the return from government control of salaries to collective bargaining. The first commitment was fulfilled but was at once denounced by the trade unions as totally insufficient. The Socialist-led F.O. trade unions called a 24-hr. general strike for Nov. 25 in support of a general wage increase and the Communist-led C.G.T. declared its approval. The strike was effective in all the trades dominated by Communist unions and much less so in those dominated by Socialists. The approval of the strike by the executive committee of the Socialist party after it had been declared harmful to the public interest by the prime minister of a government which included Socialist ministers, was a reminder that the coalition remained badly flawed. The government's bill for restoring collective bargaining immediately met with sharp criticism because it provided for compulsory arbitration.

The budget estimates for 1950 laid before the National Assembly provided for ordinary expenditure of Fr.1,535,000 million and an extraordinary one of Fr.740,000 million. The government was asking for Fr.240,000 million of new taxes, but there was sharp resistance to this proposal.

Difficulty in working a coalition of such diverse parties increased expectation of new elections which, however, could only be brought about if the National Assembly curtailed its own existence by a law. Since all the parties desiring elections also desired a change in the electoral system first, and the two parties not desiring elections or a change in the law (M.R.P. and Communists) had an absolute majority in the National Assembly, it was difficult to see how elections were to be brought about.

General Charles de Gaulle (q.v.) in his press conference on Nov. 20 seemed to show more inclination towards co-operation with other political groups in internal politics, but was if anything more critical than before of France's English-speaking allies. Criticism was widespread, not least in the National Assembly, of Great Britain for her attitude towards the Council of Europe, which became a very important element in France's political hopes. There was also a good deal of anxiety about the alleged desire of important U.S. groups to arm Germany and Spain rather than France.

From April 20 to April 25 a World Congress of Partisans of Peace was held in Paris under Communist auspices. This brought into existence a permanent organization under cover of which a good deal of Communist activity took place.

The official French population statistics for 1948 recorded a further small increase of births (864,000 as compared with 863,000 in 1947) and a further fall of deaths (506,000 as compared with 533,000) so that the surplus of births over deaths was for the second time running the highest in the statistically recorded history of the country. (D. R. Gl.)

Education. (1947-48) Elementary schools: state infant 3,463, pupils 373,649, private infant 185, pupils 14,271; state elementary 70,014, pupils 3,735,657, private elementary 11,003, pupils 899,036; state higher elementary, pupils 173,504, private higher elementary, pupils
FRANÇOIS-PONCET

61,127: total elementary 84,665, pupils 5,257,244. Secondary schools: boys 589, pupils 256,620, girls 398, pupils 170,188; total 947, pupils 427,008. Lower professional schools numbered more than 220 with over 80,000 pupils. Higher education: state universities 17, students 129,025, including 40,465 in the law faculties. There were 10 other state institutions of higher education, 6 free (Catholic) universities and more than 80 institutions of higher technical education.

Agriculture. Tables II, II and III show respectively the production of main crops, the amount of livestock and the production of some of the most important foodstuffs.

Transport and Communications. By 1949 the French national railways system (25,271 mi.) was virtually reconstructed with all its prewar facilities. In the autumn of 1944 only isolated sections totaling 11,125 mi. were open to traffic. More than 2,500 bridges and viaducts and some 70 tunnels which had been destroyed during World War II had been repaired or rebuilt. In 1948 the monthly average of passengers carried was 2,554 million passenger-km, as against 1,837 million passenger-km in 1938. The monthly average of freight carried in 1948 was 3,457 million ton-km, as against 2,210 million ton-km in 1938. Roads (1948): 631,000 km. Navigable waterways (1947): 8,438 km. Shipping: vessels 1,797,399 gross tons, 4,555,600 net tons; (Dec. 31, 1949) merchant vessels 657, gross tonnage 2,709,786. Telephone (1947): subscribers 2,108,000. Wireless receiving set licences (1947): 5,728,000.

Finance and Banking. Table VII gives the postwar budget figures with the last prewar budget as a measure of comparison.

*Actual: 1 Estimate: 2 Extraordinary expenditure for defence not included.

Public debt (million francs): internal (Sept. 1, 1939) 432,634, (June 30, 1943) 2,564,734, (Dec. 31, 1949) 6,926,517. Currency circulation (million francs): (Dec. 1938) 111,000; (Dec. 1945) 570,000; (Dec. 1949) 1,278,000, including the Saar. This more than eleven times the increase of the note circulation in 11 years is a natural consequence of the transformation of cash money into currency. The note circulation in dollars was $5,170 million in 1938 and $3,650 million in 1949. Between Dec 1932 and Dec 1949 the nominal value of the gold reserves decreased only from Fr 83,128 million to Fr 62,000 million, the successive devaluations of the franc and re-estimation of the value of the gold reserve in new currencies concealing the true picture. In weight, however, the gold reserve decreased from 4,500 metric tons in Dec. 1932 to 464-6 metric tons on Aug. 31, 1949. Sept. 20, 1949, the franc was devalued for the tenth time since July 25, 1928, the new exchange rates being SFr = Fr 350 and 1£ = Fr 980.

(K. SM.)

FRANÇOIS-PONCET, ANDRÉ, French politician and diplomat (b. Provins, Seine-et-Marne, June 13, 1887), was educated at the Ecole Normale Supérieure. He served in World War I as an infantry lieutenant and, from 1916, worked in Switzerland for the French Foreign Office. In 1919 he was a member of a French Economic mission to the United States and in 1920 became director of the Société d’Études et d’Informations Economiques founded under the auspices of the Comité des FORGES. In 1922 he was press officer of the French delegation to the Genoa conference and in 1923 adviser with the French occupation forces in the Ruhr. Entering politics as a moderate Republican, he was elected deputy of Paris in 1924 and again in 1928. He was under-secretary of state for fine arts (1928), for foreign affairs (1930) and in 1932 protector of the French universities in the Laval cabinet (Feb. 1931). He was ambassador to Germany, 1931-38, and then to Italy. In June 1940 he returned to France and on Jan. 24, 1941, was appointed a member of the National council. In 1942 he was controller general of the press at Vichy but in June 1943, at Grenoble, he was arrested by the Gestapo and interned in the Austrian Tyrol until liberated by French troops in May 1945. For three years he directed and wrote on foreign policy in FIGARO. On Nov. 15, 1948, he was appointed envoy extraordinary at General J. M. P. Koeing’s headquarters at Baden-Baden, and on May 19, 1949, French high commissioner in Western Germany; he assumed his duties on Aug. 19. In 1920 he married Mlle. Jacqueline Dillais, and there were five children of the marriage.
FRANCO Y BAHAMONDE, FRANCISCO,
Spanish army officer and statesman (b. El Ferreol, Galicia, Dec. 4, 1892), leader (Caudillo) of the empire, chief of state, commander in chief of the armed forces, prime minister and head of the Falange Española Tradicionalista y de las Juntas de Ofensiva Nacional Syndicalistas. (For his early career see Encyclopædia Britannica and Britannica Book of the Year 1949.)

In a speech before the Cortes, on May 18, he accused Great Britain of failure to keep promises made to Spain during the war, quoting Winston Churchill as having said in 1941 to the Duke of Alba, then Spanish ambassador in London, that if England won the war she would help Spain to become a strong power in the Mediterranean and support her territorial aspirations in North Africa. (Ernest Bevin declared in the House of Commons on June 22 that there was no record in the Foreign Office archives justifying such a claim and Anthony Eden said that no such commitment was ever made). On Oct. 22 he arrived aboard the cruiser “Miguel de Cervantes” at Lisbon for a state visit. A reception at the quayside by Marshal A. O. de Fragoso Carmona, president of the Portuguese republic, and Dr. A. de Oliveira Salazar, the prime minister, was followed by a military parade. The visit reciprocated President Carmona’s to Spain in 1929, and was the Caudillo’s first trip abroad since 1941. He returned to Madrid by air on Oct. 27.

FRASER, PETER. New Zealand statesman (b. Fearn, Scotland, 1884), became prime minister on April 1, 1940, in succession to M. J. Savage. (For his early career see Britannica Book of the Year 1949.)

In Oct. 1948 he led the New Zealand representatives at the Commonwealth prime ministers’ conference in London, and later visited Scotland, Canada and the United States returning to New Zealand in Jan. 1949. He again visited England in April 1949 for a further meeting of the Commonwealth prime ministers. Accompanied by Joseph Chifley (q.v.), prime minister of Australia, he attended Anzac day celebrations in London on April 25. He returned to New Zealand in May. In the general election on Nov. 30, the Labour party lost eight seats to the National party thus leaving the government in a minority. On Dec. 7 he handed the resignations of himself and members of the cabinet to the governor general, Sir Bernard Freyberg, and on Dec. 13 was succeeded as prime minister by S. G. Holland (q.v.).

FREDERIK IX (CHRISTIAN - FREDERIK - FRANZ - MICHAEL - KARL - WALDEMAR - GEORG), King of Denmark (b. Castle Sorgenfri near Lynby, March 11, 1889), succeeded to the throne on April 20, 1947. (For his early life see Britannica Book of the Year 1949.)

On March 11, 1949, the king celebrated his 50th birthday, which was unmarked by any official ceremony, though, appearing with Queen Ingrid on the balcony of Amalienborg palace, he thanked for their loyalty a crowd of some 50,000 who had assembled to greet him on the anniversary. On July 20 the king and queen left Copenhagen in the royal yacht “Dannebrog” for a visit to the Faeroe Islands (q.v.). On Nov. 27 the king and queen arrived in London on a short private visit. They spent a night as the guests of King George VI and Queen Elizabeth at Windsor castle. On Nov. 30 they were present at a luncheon at the Danish embassy and among the guests were Winston Churchill and Clement Attlee.

FREEMASONRY. The grand festival of the United Grand Lodge of England was held on April 27, 1949. The Duke of Devonshire was proclaimed on his re-election as grand master and he re-appointed Lord Scarborough deputy grand master and Brigadier General W. H. V. Darell assistant grand master.

At its quarterly communication in September, the Antient Free and Accepted Masons of the Grand Lodge of England re-affirmed the principles of the craft. It was felt that if freemasonry deviated from its course by expressing an opinion on political or theological questions it would create discord among its members. At the same meeting it was agreed to increase quarterage dues and registration fees as from Jan. 1, 1949. It was estimated that the increase quarterage payments would provide an additional £20,000. Warrants were granted for over 100 new lodges, bringing the total of lodges on the register to over 6,200.

The 350th anniversary of the earliest minute of the Lodge of Edinburgh (Mary’s Chapel) No. 1 was commemorated in July. The King sent a letter congratulating the Lodge. The oldest lodge in Norway celebrated its bi-centenary.

Nearly 600 Freemasons from the western zones met in Frankfurt, Germany, on June 19 and decided to establish a central Grand Lodge, thus reviving the craft on a national scale for the first time since it was banned in 1933. (X.)

FRENCH COLONIAL EMPIRE; see FRENCH UNION.

FRENCH LITERATURE. During 1949 many French writers whose participation in postwar public affairs had seemed a logical continuation of their wartime activities lost some of their illusions as to a writer’s responsibility. The non-Communist leftist political party founded in 1948 by Jean-Paul Sartre and Daniel Roussset disbanded as a result of internal disputes; it was rumoured that André Malraux was considering abandoning his position as chief of information to General Charles de Gaulle; even certain communists and their sympathizers—Edith Thomas, Jean Cassou, Jean Bruller (Vercors), Pierre Emmanuel—publicly announced their break with party ethics. Regeneration, even organization, of the critical, realistic and frequently exasperated French intellect seemed more difficult to accomplish than at any time since before 1940.

Commenting on the Balzac centenary celebrations an older critic expressed the hope that after re-reading La Comédie humaine, French novelists would return to observation of their time rather than continue “to wrack their brains over insoluble metaphysical problems.” Some critics were possibly unaware that certain writers had already exchanged these problems for those closer to their own métier.

Whatever may have been the nature of their extra-literary preoccupations—whether sociological, philosophical, political or all three—it was evident in 1949, despite the apparent confusion of the French literary scene, that only those who, in addition to having participated in these probings, were also aware of the expanding frontiers of consciousness and of the consequent need for new language techniques, had succeeded in emerging above the level of merely competent writing—memoirs, reportages, fictionalized current events, etc. —that flooded the bookshops as a result of the introduction of high-powered merchandising methods into the French publishing world where, until recently, the goal was prestige rather than large profits. It is in fact, probably no exaggeration to say that, because of the latter factor in particular, much of the most original writing of the year remained almost clandestine in its influence. In any case, the increasing number of commercially inspired literary awards (more than 100 were distributed) brought out no important new talents and only served to weaken the significance of the awards that existed.

Here such classically written works as Jean-Paul Sartre’s La Mort dans l’âme (third and most interesting volume of Les Chemins de la liberté), or Les Communistes by Louis
Aragon (q.v.), received wide notice, as did the two prize-winning novels: Robert Merle’s Week-end à Zuydercoote (Prix Goncourt), a Hemingway-like story set against the background of the battle of Dunkirk, and Louis Guillou’s 800-page chronicle of life in a small Breton town, Jeu de patience (Prix Théophile Renaudot). It was, nevertheless, in the more experimental works of such less advertised writers as Marcel Bissaux, Les Pas contés, Noël Devaux, Compère, vous mentez, André Dhotel, David, Pierre Gascar, Les Meubles, Nathalie Sarrut, Porträt d’un unconnu, C. A. Cingria, Bois sec, bois vert, that the gradual evolution of the French novel away from the event and obligation, toward a new reality that was neither surrealist nor existen- tialist could be seen. This tendency toward a new, more concrete, realism was also to be seen among the poets, whose work was more concerned with “things” than with abstract ideas or with the different mystiques that had haunted the immediate postwar years. Prône, by Francis Ponge, Fête des arbres et du chasseur, by René Char, La Vie dans les plis, by Henri Michaux, were, each in their way, representative of this tendency. Contre-terre, by a younger poet, René de Sollier, also revealed this direction. The extraordinary popularity of another realist, Jacques Prévert, whose satirical, tender, easily accessible poems were being quoted like song hits by an entire generation of young people, was confirmed by the enthusiastic reception of new popular editions of his Paroles and Histoires, first published in 1946. Critics noted that this was the first time since Victor Hugo that a poet could be said to have penetrated to this extent beyond the literary world. The cinema, for which Prévert had written frequently, had done much to make this popularity possible.

Other events in the year’s poetic activities were the publication of two volumes by Paul Eluard, Corps mémorable and Une Leçon de morale, as also of a collection of Philippe Soupault’s later poems under the title Chansons, and a volume of the collected poems of André Breton. Here it should be recalled that when the critics, Pascal Pia, Maurice Saillot and Maurice Nadeau presented as a supposedly authentic unpublished poetry by Arthur Rimbaud, a pastiche entitled La Chasse spirituelle (an affair that caused some stir in Paris literary circles), it was Breton who immediately launched one of his most penetrating defeas of the true poet in a little volume of accusation entitled Flagrant délit.

During the early theatrical season, a number of established playwrights remained silent, or, as in the case of Henri de Montherlant’s Demain il fera jour, Jean Anouilh’s cynical comedy, Ardèle ou la Marguerite, and Henri Bernstein’s La Soif, presented plays that added little to their reputation. Two plays of value that marked the first months of the year were that of the Catholic existentialist, Gabriel Marcel, Un homme de dieu, a probing analysis of religious motives, and Jean Genet’s desolate if brilliantly written play of crime and passion, Haupe surveillance, Le Roi pêcheur, a modern poetic version of the Grail legend, by a neurotic and to the dramatic field, Julien Gracq, obtained a critical succès d’estime, as did the poet Georges Audiberti’s La Fête noire, for its lyrical safré and verbal richness. The sensations of the autumn season were Roger Vailland’s Abélard et Héloïse, and Michel Ghelderode’s Fastes d’enfer, the former aggressively, intellectually anti-clerical and the latter blasphemously and obscene. There was a cry of scandal, but both playwrights held the stage for several months. A French adaptation by Jean Coteau of Tennessee Williams’ A Streetcar Named Desire aroused considerable interest.

As usual in France, there appeared a large number of excellent critical essays that varied in subject from the sexual emancipation of women (Le Deuxième sexe, by Simone de Beauvoir), or a plan for social, spiritual and political re-organization of France (L’Enracement, by Simone Weil) to the more intellectualized aesthetic and philosophical considerations of literature and art by Maurice Blanchot, La Part du feu et lauréat et Sade, Maurice Merleau- Ponty, Sens et non-sens, or Francis Ponge, Essais critiques. Jean Paulhan’s resuscitation of the penetrating critical works of Félix Fénéon was an event of interest, as was the analysis of Debussy, Debussy et le mystère by Vladimir Jankelevitch.

In the field of pure philosophy 1949 saw the publication of two volumes of lectures delivered before Jean Wahl’s Collège Philosophique (founded in 1946), as well as an important book by Gaston Bachelard, Le Rationalisme appliqué, which completed the vast work of this original thinker. Continued interest in the philosophy of existence was evidenced by such titles as De l’essence de la vérité, a translation from the German of Martin Heidegger; Le Vrai visage de Kierkegaard, by Pierre Mesnard; Gabriel Marcel and Karl Jaspers, by Paul Ricoeur. Sociology, science and political economy were represented by the important volume, La Structure élémentaire de la parenté, by the ethnologist, Claude Lévy-Strauss; Le Mythe de l’éternel retour, by Mircea Eliade; Loki, by Georges Dumézil; La Part maudite, by the curiously universal Georges Bataille; La Science et l’espérance, posthumous notes of Jean Perrin (awarded the 1926 Nobel prize in Physics), and Principes du fédéralisme, by Robert Aрон.

Among the 20 or so literary reviews, Cahiers du sud, Esprit, Paru, La Table ronde, 84, L’Age nouveau, Mercure de France, Les Cahiers de la Pléiade, Psyché, Présence africaine, Contrepoints and Dieu vivant may be said to have been the most representative. A new review, Empédocle, made its appearance, and the disappearance of Georges Bataille’s excellent Critique was generally deplored. Four weekly newspapers: Les Lettres françaises, Les Nouvelles littéraires, Le Figaro littéraire, La Gazette des lettres and one daily, Combat, supplied well-informed news and criticism of literary activities. (See also LITERARY PRIZES.) (M. JOL.)

FRENCH UNION. With the establishment, by the constitution of 1946, of the French Union, in which are comprised both the mother country and the former empire, the old colonial terminology was abolished and for the colonies were substituted four categories of overseas regions. The older, completely assimilated colonies claimed recognition as French départements administered as in the mother country; the others became overseas territories (territories d’outre-mer) which henceforward would elect representatives to parliament and would have their own local assemblies possessed of wide powers; the trust territories, to be known in future as associated territories, were similar in structure to the overseas territories and had the same electoral privileges; lastly, there were the former protectorates, now styled associated states which could belong to the union only by an act of voluntary accession.

Two of the three central instruments of government already in operation were (1) the presidency of the French Union, exercised, after the passing of the constitution, by the president of the republic ex officio, and (2) the Assembly of the French Union, of which 75 members represented metropolitan France (50 chosen by the National Assembly and 25 by the Council of the Republic) and 75 members were elected by the assemblies of the overseas countries, and which had been sitting in a consultative capacity since Dec. 1947. By an act of April 24, 1949, the High Council of the French Union was set up, the function of which was to help the government with the general administration of the union and act in an advisory capacity. It included a delegation from the French government consisting of the chief ministers and representatives of the associated states, under the chairmanship of the president of the union. In
FRENCH UNION

283

some respects reminiscent of the Imperial Commonwealth conference, the High Council could become the nucleus of a federal government. Its inception was not unattended by difficulty owing to uncertainty as to the scope of its powers and to the abstention of Morocco and Tunisia whose rulers had protested against a statement by the minister of overseas France in which he had included these countries in the French Union; by the end of the year, therefore, the High Council had still not been summoned.

Total area of the overseas territories of the French Union: approximately 4,671,112 sq. mi. Total pop. (1948 est.): 77,287,000. Certain essential information on the component parts of the French Union is given in the table.

Algeria. The cantonal elections held on March 20-27 confirmed the swing to the right in the first electoral college (Europeans and évolûts or developed Moslems) and the success of the “independent” supporters of the government in the second college (Moslems only). Four seats were lost by the Communists and six out of eight by the U.D.M.A. (Union Démocratique du Manifeste Algérien), which, led by Ferhat Abbas, stood for a republic of Algeria. The Nationalist M.T.L.D. (Mouvement pour le Triomphe des Libertés Démocratiques, led by Messali Haj), which attributed its defeat to administrative pressure, expressed itself with accumulated violence in the press and at public meetings. In the course of a triumphal tour in May and June, Vincent Auriol (q.v.), president of the republic, was scathing in his references to the separatists. On the whole, however, conditions were quiet. In accordance with its constitution the Algerian Assembly elected as its president a Moslem, Salah Abd-el-kader, who proclaimed his unfailing affection for France. A resolution of the Assembly establishing a system of social security for the non-agricultural workers was put into force by a decree of June 10. On the occasion of the centenary of the death of Marshal Bugeaud, conqueror of Algeria, the government erected a monument to the memory of his gallant and honourable foe, the Emir Abd-el-Kader. The three Algerian départements were included in the Franco–Italian customs union under the treaty signed in Paris on March 26.

Population (Oct 31, 1948 est.) Europeans 960,000 (11.2% of the total). Chief towns: Algiers (cap. 315,210); Oran (256,661); Constantine (118,774).

Mineral Production (1948, metric tons) Phosphate rock 670,000; coal 225,800; iron ore 1,871,500; zinc ore 13,771.

Agriculture. Main crops (1945, metric tons). wheat 906,950; barley 742,270; oats 117,227; potatoes 164,990; tobacco 21,068; dried figs.
opinion was rallied to the reigning bey, Mohammed el-Amin and one of the most acute causes of Franco-Tunisian disagreement was removed. But the Nationalist opposition was reinforced on Sept. 8 by the return from Cairo of Habib Bourguiba, chairman of the Tunisian Destour (Constitutional) party to whom the bey accorded a cordial welcome. However, no serious unrest occurred. The resident general, Jean Mens, exerted himself to arrange for the sale on the French market of 3,000 tons of Tunisian oil in spite of the opposition of producers in metropolitan France.

French-trade. (1946, Fr. million) Imports 33,826; exports 12,675.

Transport and Communications. Roads (Jan. 1949), 8,704 km.

French West Africa. Paul Béchard, the high commissioner of the republic for West Africa, was entrusted on Jan. 5 with putting into operation the military defence of West Africa, Togoland, Cameroun and Equatorial Africa. The Natives' Nationalist party, the R.D.A. (Rassemblement Démocratique Africain), offshoot of the Communist party, continued its agitation, but its influence was clearly declining, to the advantage of the local parties, even on the Ivory Coast where it had most solidly established itself.

Togoland. According to the Dec. 31, 1948, estimates there were in this trust territory 841 Europeans. Capital: Lomé (pop., 30,063).

Togoland. Main crops (1948, metric tons): cotton 570,000; cocoa 99,148; pigs 169,539; goats 1,667; sheep 2,944.

Finance. (Fr. mill.) Budget (1948 est.) balanced at Fr. 274 million. Monetary unit: franc C.F.A. (Colonies Françaises d'Afrique).
cargo unloaded (metric tons) 186,300; loaded 163,300. 
Finance. Budget (1949 est.) balanced at Fr C.F.A. 2,452,3 million. 
French Equatorial Africa. According to the Jan. 1, 1948, census, the territory, whose population was only 13,320 Europeans, including 9,900 French, in all four territories of French Equatorial Africa. 
Chief towns: Brazzaville (cap., pop. [July 1949 est.] 83,579, including 4,353 Europeans); Bangui (41,044); Fort Lamy (18,276); Libreville (12,600). 
Mineral Production. (1948) Gold 1,982 kg.; diamonds 118,000 carats; lead ore 5,006 metric tons. 
Agriculture. (1948, metric tons, export only) cotton 32,226; palm kernels 7,563; palm oil 2,389; coffee 2,415; cocoa 2,041; rubber 325; mahogany 34,360; okoumé (light mahogany) 172,632. 
Foreign Trade. (1948, Fr C.F.A. million) Imports 6,010; exports 6,177. 
Finance. Budget (1949 est.) balanced at Fr C.F.A. 2,688 5 million. 
French Somaliland. From Jan. 1 the status of Somaliland was raised to that of a free territory. A new currency, the Jibuti franc, freely convertible into U.S. dollars, was instituted on March 20. The 1946 constitution, which in practice reserved the right to vote to the évolués, had the effect of giving a majority to the inhabitants of mixed origin, to the detriment of native Danakils and Issa Somalis. The consequence was an outbreak of disturbances culminating in riots and violence: 38 people were killed and 154 wounded at Jibuti on Aug. 29. 
Population. (1948 est.) Europeans 2,500, including 1,750 French. 
Capital: Jibuti (pop., 22,000). 
Foreign Trade. (1948, Fr C.F.A. million) Imports 1,777 4; exports 1,018 2. 
Transport and Communications. (1948) Roads: 25 km. Railway: 98 km. Motor vehicles licensed: cars 169, commercial 210. Telephone subscribers: 296. Ships entered at Jibuti 1,357; cargo unloaded (metric tons) 240,775; loaded 166,575. The volume of traffic is explained by the fact that Jibuti was the main port serving Ethiopia. 

Madagascar. The Supreme Court of Appeal in Paris, on July 7, rejected the petition submitted on the ground of irregularities by the eight prisoners convicted on Oct. 4, 1948, by the court at Antananarivo, but the president of the republic immediately summoned the death sentence to deportation for life. Two deputies to the National Assembly, Ravonghany and Raseta, were among the condemned. The reprieved Malagasy leaders of the armed revolt of March 1947 were transferred to the French prison island of Mayotte belonging to the French colony of Belle-Île off the south coast of Brittany, as had been ordered by the government on Aug. 2, 1949, but which so far had not been effected. From efforts made to secure a revision of the case it became more and more clear that the accused had not had the benefit of their constitutional rights. After an inquiry by a commission sent by the Assembly of the French Union, the latter, on June 10, requested the government to take steps to remedy the situation which in its political, economic and social aspects alike gave cause for anxiety. On Jan. 26 an agreement was signed between the Paris and Washington governments for the export of 19,800 tons of graphite to the United States. 
Population. (1947 est.) Europeans 60,498, including 40,887 French. 
Chief towns: Antananarivo or Tananarive (cap., pop. 165,477, including 17 402 French and 2,780 foreigners); Tamatava (29,776); Majunga (26,271); Diego-Suarez (21,677). 
Mineral Production. (1948, metric tons) Graphite 14,228; corundum 430 2; mica 507 4; iron 60 6. Precious stones (kg.): garnets 133,004; beryls 9,082; agates and chalcedones 4,030. 
Agriculture. Main crops (1948, metric tons): rice 744,323; cassava 737,462; sweet potatoes and taros 201,602; potatoes 90,515; maize 56 8; sugar cane 293,400; coffee 21,068; vanilla 461. 
Foreign Trade. (1948, Fr C.F.A. million) Imports 8,941 9; exports 6,121 5. 
Finance. Budget (1949 est.) balanced at Fr C.F.A. 2,646,147,000. 
Réunion. In 1946 only 2 67% of the total population, that is 6,698, were described as of French origin, although 97% were French. Chief towns (pop., 1946 census): Saint-Denis (cap., 36,096); Saint-Louis (23,936); Saint-Paul (25,935); Saint-Pierre (22,379). 
Agriculture. Main products (1948) sugar 67,661 metric tons (1949 est., 110,000 metric tons); rum 86,760 hl., vanilla 53,000 kg. 
Finance. Budget (1949 est.) balanced at Fr C.F.A. 174 8 million. 
Foreign Trade. (1948, Fr. million) Imports 878, exports 154. Main exports: gold 330 kg., balata gum 884 metric tons, tulip-wood 9,700 kg. Cargo unloaded (metric tons): 15,000; loaded 3,000. 
Foreign Trade. (1948, Fr. million) Imports 5,415; exports 3,835. 
Finance. Budget (1947) balanced at Fr. M. 1,049 3 million. 
Martinique. Chief towns (pop., 1946 census): Fort-de-France (66,006); Lamentin (15,114); Sainte-Marie (13,276). 
Foreign Trade. (1948, Fr. million) Imports 6,400 3; exports 4,092 2. 
Finance. Budget (1949 est.) balanced at Fr. M. 988 3 million. 
French India. In the referendum held at Bengali-speaking Chandernagore on June 19, 7,473 votes were cast for incorporation in the Union of India and 114 against. Special provisions completely separated the city from other French settlements during the negotiations for its transfer. To comply with the expressed desire of the Tamil-speaking southern settlements (Pondicherry, Yanaon, Karikal and Mahé) for an autonomous system within the framework of the French Union, the French council of ministers on Sept. 28 passed a scheme of federation for the four free cities. The referendum to determine the choice between France and India which was to have been held on Dec. 11 was postponed A rigorous blockade imposed by the Indian government on the expiration of the Franco-Indian customs convention on April 1 affected particularly Pondicherry and Karikal. The transformation of the two cities into free ports greatly increased their traffic. 
Of the four settlements the largest was Pondicherry; the population of the towns was estimated in 1948 as follows: Pondicherry (22,572); Karikal (70,541); Yanaon (5,853); Mahé (18,283). 
Foreign Trade. (1948) Imports: 3,214 metric tons valued at M.Fr. 147 1 million; exports 1,594 metric tons valued at M.Fr. 633 9 million. 
Indo-China. With its political division into three associated states, Vietnam, Cambodia and Laos, forming part of the French Union, the name French Indo-China became of only historic significance. 
On March 8 the difficult negotiations between the French government and the ex-emperor Bao Dai (q.v.) culminated in an agreement which guaranteed, within the framework of the French Union, the independence of Vietnam comprising the three Annamese-speaking Ky: Tongking or Bac-Ky (country of the north), Annam or Trang-Ky (country
FRENCH UNION

of the middle) and Cochin-China or Nam-Ky (country of the south). Diplomatic representatives in Vietnam were to be accredited jointly to the president of the French Union and the head of Vietnam, their letters of credence being signed by the president of the French Union and initialed by the head of Vietnam; the latter was to have independent representation only in China, in Thailand and at the Vatican; the Vietnamese army would have French instructors; military and economic guarantees in favour of France were also stipulated in the agreement; Vietnam would have 19 representatives in the Assembly of the French Union.

By the promise of unity to Vietnam, Cochin-China was induced to exchange its status of overseas territory for that of a province of Vietnam, this being decided on April 23, by 55 votes to 6, with 2 abstentions, by a territorial assembly elected for the purpose on April 10. Ratifying this decision on June 3 by 367 votes to 221, the National Assembly thus brought to an end the colonial status of Cochin-China which dated back to 1862.

Bao Dai, assuming the title of prime minister, on June 30 formed the first Vietnamese government, with General N'Guyen Van Xuan, president of the provisional central government of Vietnam since May 1948, as deputy prime minister, minister of the interior and minister of war. By the end of the year the French parliament had not yet ratified the agreement of March 8 which had come into force on June 14 by an exchange of letters between Bao Dai and Léon Pignon, high commissioner of the republic. At a ceremony in Saigon on Dec. 30 the administrative and political powers were formally transferred to the Vietnamese government.

The return of the ex-emperor of Annam did not to any extent rally the non-Communist nationalists or even the Catholics. The economy of the country showed an increasing decline and in spite of definite successes in the French offensive which won from the Communist-controlled Vietminh the Catholic province of Phat Diem, to the southwest of Hanoi, Ho Chi Minh continued to control the mountainous region stretching from the Sino-Tongkinese frontier to the frontiers of Cochin-China and Cambodia. Guerrilla fighting kept things everywhere in a state of insecurity. The appointment on July 27 of Gen. M. Carpentier as commander in chief was interpreted as an intention to increase military pressure; but the approach of the Chinese Communist armies strengthened the spirit of resistance of Vietminh and threatened to create a new danger of international import. The French Left consequently showed signs of being anxious for a truce.

In Cambodia the fall of the Penn Nouth government on Jan. 21, following a financial scandal, brought about a crisis which was ended on Feb. 1 by the appointment to the premiership of Yem Sambaur, leader of the Democratic party which had provoked the emergency. The seriousness of the internal situation, due to the successes of the rebel Issaras, supported by Vietminh, and to the progress of the opposition which was taking the risk of compromising the Franco-Cambodian agreement, led King Norodom Sihanouk to dissolve the National Assembly on Sept. 18 and to postpone sine die the elections which, according to the constitution, were to have been held within two months. The king proceeded to Paris on Oct. 6 for the purpose of signing the treaty with France, but as the ministerial crisis persisted he was obliged to return on Oct. 26. The treaty was eventually signed by the prime minister, Sisovath Moniret, on Nov. 8. Cambodia sent five representatives to the Assembly of the French Union.

On account of a budgetary dispute between the government and the Assembly, the prime minister of Laos, Souvan-narath, resigned on Jan. 2 and was replaced on Jan. 10 by Prince Boun Oum, leading personality of southern Laos. By a treaty signed in Paris on July 19 by President Vincent
Auriol and King Sisavang Vong, Laos was recognized as an independent associated state. This agreement led on Oct. 24 to the voluntary dissolution of the "free government of Laos," known as the Lao Issara government, headed by Phya Khammas at Bangkok. Laos sent three representatives to the Assembly of the French Union.

Population. (1946 est.) Europeans 26,000, including 23,000 French and assimilés. Chief towns (pop., 1949 est.): Saigon with the seaport of Cholon (1,700,000), Hanói (160,000, including 6,000 French and 7,000 Chinese); Huiphong (92,000, including 5,000 French and 30,000 Chinese); Punkki (5,000).

Agriculture. Main products (1948, metric tons): rice 4,210,000, sugar 15,785; rubber 43,901.

Foreign Trade. (1948, MFr million) Imports 40,087 7; exports 19,918.

Telephone subscribers 5,400.

Finance Budget (1949 est.) balanced at Piastres 1,426 6 million. Monetary unit: piastre = MFr 17.

New Caledonia. The population of Nouméa, the capital, was estimated in 1946 at 10,466. There were 18,700 Europeans in the islands.

Foreign Trade. (1948, Fr C.F.P. million) Imports 554, exports 328.

Main exports: (metric tons): nickel ore 96,415, nickel (matte) 6,300, chrome 75,021; gypsum 779, copra 1,569, coffee 920; hides 285.

Finance Budget (1949 est.) balanced at Fr C.F.P. 274 5 million. Monetary unit: MFr = MFr 5.50.

French Pacific Islands. This overseas territory comprises eight archipelagos, the most important being the Society Islands, including Tahiti (area: 600 sq. mi.; pop [1946 est.], 24,820), with the town of Papeete (pop [1946], 12,482).

Foreign Trade. (1948, Fr C.F.P. million) Imports 381 4, exports 405 5.

Main exports: (metric tons): phosphates rock 187,000, copra 18,439; vanilla 154.

Finance Budget (1948 est.) balanced at Fr C.F.P. 164 7 million.

(F. A. J.)

FRIENDS, THE RELIGIOUS SOCIETY OF. In London Yearly Meeting, including Friends in Australia and New Zealand and scattered members, the membership in 1948 was 21,888, an increase of 41. For Great Britain alone the increase was 26, on a total membership of 20,730.

In Ireland there were 1,960 members, an increase of three over 1947. After serving for six years as clerk, i.e., chairman of the society in Great Britain, Mrs W. Maude Brayshaw was succeeded by Bedford Crossfield Harris.

The proceedings at the 281st Yearly Meeting held in London in May indicated that the present emphasis in the life and thought of the society was that Quakerism was intrinsically Christian and that it was essential to the world today.

The Yearly Meeting considered carefully the position of Friends’ schools and their part in the developing national system of education. The society declared itself opposed to military conscription on the grounds that it was contrary to Christian principle, and the conscription group was instructed to inquire into the treatment of conscientious objectors in certain European countries.

Relief work initiated by Friends Relief Service and taken over by the Friends Service council in 1948, was continued among displaced persons in Germany and among refugees in Greece and elsewhere. It co-operated with the American Friends Service committee in work among Arab refugees in Palestine and also, by means of Friends Service units, in medical and relief work in nationalist and Communist China, and in India. Long established Quaker work overseas continued in India, China, Madagascar and elsewhere. During 1949 the Friends Committee for Refugees and Aliens, set up in 1933 with the flow to this country of German refugees, was discontinued. The chairman and the secretary of the Friends Relief service were awarded the Médaille de la Reconnaissance Française by the French government.

The Society of Friends in Germany lost members during the war period, but doubled its membership between 1945 and 1948. With an increase of 51 during 1948 the full membership stood at 450 in 1949; but at some meetings "friends of the Friends" exceeded the actual membership times, so that the total congregations might well have been several thousands.

The year 1949 marked the centenary of the Bedford Institute association which is responsible for Quaker social work in seven centres in east London. (H. W. Pe.)

United States. Statistics compiled by the Friends World Service Committee for Consultation indicated that there were no more than 176,000 persons in 1949 who bore the name of Friends (Quakers). They composed 53 Yearly Meetings and annual conference groups all over the world, the largest being 119,000 in North America, 26,000 in Africa (chiefly in Kenya and Madagascar), 5,000 in Central America, 1,000 in Australia and New Zealand, and 900 on the European continent and 400 in Asia. The major channels of service were provided by the Friends Service council operating in London and the American Friends Service Committe with headquarters in Philadelphia, Pennsylvania, and regional offices in 13 American cities. The American Friends Service Committee organized a large-scale relief programme among Arab refugees in the Gaza area of Palestine where, in conjunction with United Nations Relief for Palestine Refugees, some 40 Quaker workers distributed food and clothing and provided shelter and medical services for more than 200,000 refugees.

The continuation of the "cold war" prompted the American Friends Service Committee to set up a working party to study relations between the United States and Russia. In July the working party released a statement later printed in revised form under the title The United States and the Soviet Union: Some Quaker Proposals for Peace. The group concluded that Russian communism and western democratic capitalism were both likely to persist and that peaceful co-existence rather than victory by one side should be the aim of governmental policy. Three specific proposals for action were made: the re-opening of east-west trade; the creation of a neutralized and unified Germany; and the strengthening of the United Nations as an agency for settling disputes, for reducing arment (including atomic weapons) and for fostering an atmosphere in which a more effective instrument of world government could be created. (See also CHURCH MEMBERSHIP.)

F. T.

FRUIT. Chief interest during 1949 centred round muss storage. Was it a practical and more economical alternative to the normal gas store? Woodland moss was shown: (a) to be capable of absorbing ethylene and acetaldehyde, the most important gases given off in the ripening of fruit, and at the same time (b) to give some control of humidity and a partial refrigerating effect. Invented in Switzerland and developed scientifically in France, this system was brought to Great Britain for trial in the 1948-49 season. The results were inconclusive, owing to a constructional fault in the building. In August two scientists of the Food Investigation organization gave a negative report upon the system after a ten weeks’ laboratory test. Large-scale continuation trials took place in private hands through the winter.
Release of materials by the British government allowed fruit growers to build new packing and storing stations, both facilities being badly needed to improve the quality of the deciduous fruit supply. Four stations, with a combined handling capacity of 1,500,000 bu. were opened during the year and by December fruit-storing capacity was 50,000 tons, compared to 30,000 tons in 1939. Storage plants on a smaller scale were also extensively developed in the Netherlands. Another system of storing fruit—by dipping the individual fruits in an oil emulsion—was also given a full-scale trial in Great Britain.

World fruit production was estimated at some 10% higher in 1949 than in 1948—which was not a good year. Apples, pears, cherries, plums, apricots and peaches were all in larger supply, with citrus crops slightly below average. The U.S. harvested the largest crop of apples since 1939, and had to resort to government purchase for the school lunch and institutional feeding programmes in order to relieve the pressure of deciduous supplies on the fresh market. In Great Britain cherries were a record crop of 31,000 tons. Plums were estimated to yield at the 1939-48 average, with apples and pears 40 and 43% respectively above average. France expected a double table-apple crop but only half an average cider-apple crop. In general, the drought in western Europe affected quality more than yield, except in the case of soft fruits which were a poor crop.

To counter this general supply situation attempts were made to reverse the declining trend in international trade in fruit. Canada raised the import quota for horticultural products from 70% to 80% for the second quarter of the year, and lifted it entirely for the second half of the year. Following the wish of the Organization for European Economic Co-operation to liberalize intra-European trade, Great Britain applied open general licence procedure (with reservations) to horticultural produce. Imports of Canadian and U.S. apples were also increased, but overall, owing to a lower intake in the early part of the year, the horticultural import bill did not exceed average.

The British Ministry of Food de-controlled lemons in bulk, price and distribution and adopted a policy of caution in the regulation of other fruit supplies. Apples and pears were de-controlled until the stored crop began to come on to the market, provided that prices were kept at reasonable levels. All soft fruits were freed from price control in 1949, but growers' prices were generally lower than in 1948. Strawberries, raspberries and blackcurrants together were down by about 12%. Soft fruit acreage in England and Wales was 3% above 1939. Respective acreages and indices (1939 = 100) were as follows: strawberries 20, 141 (108), raspberries 3, 779 (91), blackcurrants 15, 501 (149), gooseberries 6, 424 (70). (R. R. W. F.)

United States. Apples. The U.S. 1949 apple crop totalling 133,181,000 bu. was the largest since 1939, about 150% as much as the small 1948 crop (88,407,000 bu.) and a fifth above average.

Apricots. The 1949 crop in the commercial producing states, California, Washington and Utah, was 200,300 tons compared with 246,600 tons in 1948 and 12% less than the average for the decade.

Cherries. The 1949 U.S. commercial cherry crop was a large one of 243,730 tons, compared with 214,380 tons in 1948 and an average of 172,223 tons.

Dates. The Californian date crop of 1949 was estimated at 12,800 tons, compared with 16,240 tons in 1948 and only 8,352 tons average in the years 1938-47. Prices were slightly lower than in 1948.

Figs. The 1949 fig crop of California and Texas was even smaller than in 1948. California produced 28,400 tons of dried figs in 1949 (30,300 tons in 1948) and 7,000 tons not dried, compared with an average for 1938-47 of 33,030 and 16,130 tons.

Grapefruit. The 1949-50 U.S. grapefruit crop was expected to be a small one of 36,350,000 boxes, compared with 45,520,000 boxes in 1948-49 and an average of 50,528,000 boxes for the previous decade.

Grapes. The 1949 U.S. grape crop of 2,701,500 tons was slightly less than average and considerably below the 3,044,400 tons of 1948, but approximated to the prewar production. The California crop, 2,526,000 tons of the total, was far below the 2,857,000 tons of 1948 but about average.

Lemons. The expected 1949-50 average California crop of 12 million boxes (9,930,000 boxes in 1948-49) appeared to be selling at about $2.80 per box compared with $4.18 in the previous year.

Limes. The 1949-50 Florida crop of 250,000 boxes was large compared with 200,000 boxes in 1948 and an average of 158,000 boxes in 1938-47.

Olives. California in 1949 produced 39,000 tons, compared with 58,000 tons in 1948 and an average of 46,600 tons in 1938-47.

Oranges. The expected U.S. crop for 1949-50 was 105.6 million boxes, compared with 99,620,000 boxes in 1948 and an average of 93,593,000 boxes in 1938-47. The U.S. 1949 peach crop was estimated at 74,780,000 bu., considerably larger than the 65,352,000 bu. of 1948 and the 68,947,000 bu. average of the previous decade.

Plums and Prunes. The 1949 Californian plum crop, estimated at 90,000 tons, was one-third above 1948. Commercial dried prune production of 175,100 tons was 1% below 1948 and 13% below average.

Pears. The 1949 U.S. pear crop was a record one of 36,627,000 bu., about 40% more than in 1948 and 20% above average.

Pineapples. Florida pineapple production in 1949 was 5,000 boxes compared with 4,600 boxes in 1948 and an average of 9,900 boxes in 1938-47.

Strawberries. The 1949 strawberry crop was 8,866,000 crates, compared with the 10,224,000 crates in 1948 and an average of 9,138,000 crates in the years 1938-47. (J. K. R.)

FURNITURE INDUSTRY. Shortages both of labour and essential raw materials proved serious handicaps to British furniture manufacturers in 1949. High Wycombe alone found itself 4,000 short of its 1938 labour strength of 10,000 and London and other big manufacturing centres reported a similar scarcity of workers. For this reason plans were put into operation for the recruitment of new labour and the training of apprentices.

On the materials side chief shortages were hardwoods and plywood and coverings and springs for upholstery. Imports of oak from the United States were negligible because of the dollar shortage and, although supplies from West Africa gradually improved, the devaluation of the pound to a lower rate than that of the franc upset plans for a big increase of hardwood imports from France. In March most furniture woods were removed from the strict rationing system and oak veneers were returned from government to private purchase, but these moves made no difference to the total volume of supplies. There was, however, a slight increase in the allocation of hardwood plywood and veneers to furniture makers towards the end of 1949, although at the same time...
the allocation of softwoods for kitchen furniture manufacture was decreased.

Towards the end of 1948 furniture manufacturers had been granted freedom of design although under the utility scheme they were still bound by a minimum specification laid down by the Board of Trade. This continued measure of control together with the shortages of labour and materials prevented factories from working with maximum efficiency; any substantial reduction in prices and the evolution of a really new style of design were, therefore, delayed. In September the prices of non-utility furniture were de-controlled. This made little difference to public purchasing; prices dropped slightly but the high rate of purchase tax made them prohibitive to most people. The vast majority of orders were still for utility pieces in the new design-freedom ranges which were tax free.

On Jan. 1, 1949, the government set up a Development council for the furniture industry under the chairmanship of Sir David Waley. One of the council's first moves was to investigate the possibility of workable performance tests for essential furniture. The object of these tests would be to improve the general quality and durability standards of articles such as chairs and tables and to prevent the return of the cheap, badly made furniture marketed before World War II.

The bulk importation of foreign-made furniture under governmentegis was halted by the liquidation of the Furniture Import (Emergency) association.

United States. At the close of 1949 the 4,000 furniture factories making wooden household furniture showed a 15% drop in volume compared with 1948 output, but the total value of that production ($1,250 million) had been surpassed only by the $1,475 million volume turned out in 1948. At retail, the 1949 output of furniture sold for approximately $2,500 million. During 1949 wholesale furniture prices were reduced 4 1/2%, the first reduction in eight years.

In 1949 modern furniture again outsold traditional. As in 1948, French provincial was the"high style" leader for the year with 18th-century English designs and Chinese adaptations rapidly returning to favour. Mahogany continued the most popular wood, with walnut, maple, oak and cherry following in that order. The most interesting development during the year was the invasion of the United States furniture market by England, Sweden, Norway, the Philippines, Brazil, Italy, Switzerland and Scotland. Canada and Mexico remained the only foreign furniture customers of U.S. furniture factories, and furniture imports were far greater than exports. No Japanese furniture was imported, but much Chinese cane furniture was sold in the U.S. during the year. France and Germany, once big exporters of furniture, were having difficulty in supplying their own market because of the shortage of materials. (See also Interior Decoration.)

FURS. The British fur trade experienced a most difficult year during 1949. Early in the year it was thought that the government's intentions were to reduce the 100½% purchase tax on furs. This did not materialize however, and in spite of the abolition of clothes rationing in March, the sale of fur garments dropped to negligible proportions, creating considerable unemployment in the industry.

The devaluation of the pound certainly caused a great deal of activity during the last three months of the year; but this was believed to be only a temporary phase and could be attributed to the public's anxiety lest prices should rise as a consequence of devaluation.

The most favoured furs in the utility range were mink-dyed marmot, squirrel lock, beaver lamb, moleskin, pony and coney; and in the non-utility range mink, dyed ermine, dyed canadian squirrel, beaver, persian and indian lamb and musquash.

The export trade was very good, considering the restrictions with which exporters had to contend, and it was a matter for congratulation that a balance in favour of exports over imports was shown for the ten months ended Oct. 31, 1949. The figures were: Imports for 10 months ended Oct. 31: (1948) £2,249,019; (1949) £7,652,691. Exports for 10 months ended Oct. 31: (1948) £8,818,222; (1949) £8,024,738. This currency gain, although small, was probably the only gain earned by a so-called "luxury" trade in the United Kingdom.

Many events of importance took place during 1949 including the inaugural meeting of the International Fur federation in April at which delegates from 15 countries including Great Britain participated. Sir Patrick Ashley Cooper, governor of the Hudson's Bay company and first president of the federation, occupied the chair. The London fur fashion parades held in May were attended by many overseas buyers. A considerable number of orders were taken and another parade was arranged for 1950.

Of much interest to the trade and the country was the progress made by British fur breeders. This industry would take years to develop but it was worthy of note that there were about 60 breeders in Great Britain and the 1949 production of mink alone was expected to exceed 4,000 pelts.

(S. L. L.)

United States. The year 1949 was one of the worst that the U.S. fur industry had experienced for many years. Reduced consumer demand brought about a drastic deflation in prices. The supply of mink was abundant and prices were low. This fell in value during the first half of the year but recovered in the last quarter. Mink garments at prices 30% to 40% below those of 1948 created a new group of customers. Wild and ranch mink coats, capes, jackets, stoles, etc., sold well. New ranch mink coats sold retail in New York from $1,500 upwards.

Persian lamb, beaver and Russian squirrel furs were popular, but other furs were neglected and the long-haired furs were unwanted.

Promotion of fur lined cloth coats, tax free, reduced sales of fur coats. Tax free fur coats were denied further immunity from tax, and merchants were given until March 1950 to dispose of such merchandise.

All the fur exporting countries of the world shipped fur skins to the United States during 1949, especially the U.S.S.R. American furs sold steadily early in the year in many European countries, but quantities were limited because of the dollar shortage. In September, when sterling and other currencies were devalued, American fur shipments to most countries slumped.

The fur of greatest importance during the year was Persian lamb, of which about 6 million skins were sold at auction. Prices declined between 30% and 40% during 1949. The supply came in about equal amounts from Afghanistan, the U.S.S.R. and South West Africa. Estimates put ranch mink skin production in the United States and Canada at less than the 2 million 1948 total.

Furs dyed fancy colours were introduced. Midnight blue used on Persian lamb, broadtail, kid and squirrel was well received and other colours introduced were cardinal red, emerald green, caramel and navy blue. New styles were well received and favoured various collars, moderate sleeves and restrained back fullness. Popular lengths were 26 to 40 in.

Raw fur imports for the first ten months of 1949 were valued at approximately $91 million, compared with approximately $137 million for the corresponding period in 1948. Exports of fur skins for the first eight months of 1949 totalled approximately $26 million, compared with approximately $19 million in 1948.

GAMBLING: see Betting and Gambling.

GAS. The transfer of the gas industry from company and municipal enterprise to state ownership was effected on May 1, 1949, when—under the Gas act, 1948—the property of 1,056 undertakings was entrusted to 12 largely autonomous Area Gas boards, which became responsible for the manufacture and distribution of gas, coke and allied products in England, Scotland and Wales.

The Gas council, comprising the chairman of the Area boards and the chairman and deputy chairman of the council, took over the property and staff of the British Gas council and certain other organizations voluntarily established over the past 38 years by the former gas undertakings. The Gas council was to promote the efficient working of the Area boards and advise the minister of fuel and power on the gas industry. Whilst the Gas council had extensive responsibilities in financial matters and in research, education and employment, it otherwise regarded itself as a consultative body, except in so far as duties—for example, national publicity—might be entrusted to it by the Area boards. The Institution of Gas Engineers and the Gas Research board continued to be financed by the industry for the conduct of education and research respectively.

A Gas Consultative council, representative of gas consumers, was established in each area to consider matters affecting the supply of gas, the chairman being a member of the Area board. The members of these councils and of the Area boards and the chairman and deputy chairman of the Gas council were appointed by the minister.

The Area boards having deemed their responsibilities to demand almost complete autonomy, a common policy and practice did not emerge during 1949. Each area was, however, divided for operational purposes into a varying number of divisions, with sub-divisions comprising one or more of the former undertakings, under divisional or sub-divisional managers, but without uniform administrative methods as between the areas.

The Area boards in general found plant to be reasonably up-to-date and adequate, the works well managed, the distributing systems sufficient and the service to consumers good. There were, however, largely owing to the effects of the prolonged threat of nationalization and the long delay experienced in the installation of new plant, a number of undertakings where improvement was desirable. These improvements were facilitated by the ability of the Area boards to integrate, geographically and functionally, the production, distribution and administrative resources of the individual units. Nevertheless, amongst the more intractable problems there remained that of the small undertaking, situated too far from large centres of population to be supplied with gas, managed from a central source and where the capital costs of maximum efficiency could not reasonably or economically be met, in the past, by small communities.

A committee representative of the National Coal board and the Gas council was set up to implement the requirement of the Gas act that the two industries should co-ordinate their carbonization activities, in order to avoid waste of coke oven gas or over-production of coke, to conserve coal and to improve the utilization of plant and labour. The fundamental issue of the price at which the coke oven gas was to be supplied to the gas industry, raised the question of joint working or the transfer of all carbonization to the gas industry.

The price of gas in many localities was increased subsequent to nationalization, in order to relate prices to the costs of production. The rationing of coke for domestic, non-industrial and smaller industrial premises was abolished at the end of 1949, the total stock of coke at the end of Nov. 1949, having increased to the excessive figure of 2,982,000 tons. The business of the industry increased during the year. In Nov. 1949, as compared with Nov. 1948, the average weekly production of gas increased by 600 million cu. ft. and the average weekly consumption of coal at gasworks increased by 17,000 tons. The demand for better gas coal and freedom to select the coals suited for the particular plant was not met, whilst further increases in the selling price of coal, which was not of prewar quality, brought the total rise in the price to two and a half times the figure in 1939. Although some improvement was to be seen, there continued to be delay in securing new gas making plant and in the renewal and extension of mains. The production and variety of most domestic gas appliances improved, but in some areas their sale was restricted in order to avoid a demand for gas in excess of the output. Purchase tax was retained on water heaters, space heaters and certain other appliances, and gas refrigerators were almost unobtainable by the ordinary consumer owing to the export demand and housing authority priorities. Gas appliances continued to improve in design, efficiency and economy; new types became available.

Amongst the many technical problems discussed was the difficulty of producing gas at reasonable cost to meet peak demands, which are often very intermittent. At the conference of the International Gas union in London in June, it was generally agreed that the solution lay in the designing of plant, at a low capital cost, to be used only for abnormal peak requirements. The Gas Research board published a paper describing such a plant using oil. In the U.S.A. the use of natural gas was found to meet the problem, until the pipe lines carrying the gas approached maximum capacity, when they became subject to peak-load difficulties.

The proposed plans of the petroleum industry for refining in Great Britain some 20 million tons of oil annually would release large quantities of rich gas, equalling possibly one-quarter of the gas sold by the gas industry. Surplus refinery gas was supplied to Ellesmere Port, Shropshire, and similar supplies began to be given to Manchester, amounting daily to 600,000 cu. ft. of gas having a calorific value of 890 British thermal units/ct. ft. This development was of significance if suitable prices could be fixed.

The gas industry continued to expand in all countries, being particularly virile in the U.S.A. Progress was made in overcoming the devastation of war in Europe and arrears of constructional work were reduced. But for the heavy demand for, and the high cost of, plant and increasing gas prices, the expansion would have been greater than it was.

Compensation on nationalization was paid to the majority of gas shareholders during the year by the issue of 3% British Gas stock, 1990-95. The value of most shares was determined by the Stock Exchange prices on the dates stated in the Gas act, or by agreement between the stockholders' representative of each undertaking and the Ministry of Fuel and Power. The British Gas stock was issued at 100, but although its price temporarily rose to 101 7/16 shortly after nationalization, it then showed considerable depreciation, the lowest marking being 821.

GAS TURBINES: see Jet Propulsion and Gas Turbines.

GAULLE, CHARLES-ANDRÉ-JOSEPH-MARIE DE, French army officer and statesman (b. Lille, Nov. 22, 1890), former leader of Fighting France (1940-44), former head of the French provisional government (Sept. 10, 1944) and first French prime minister after World
GEMS—GENETICS

War II (Nov. 13, 1945-Jan 21, 1946), leader of the R.P.F. (Rassemblement du Peuple Français). (For his early career see Britannica Book of the Year 1949).

From his house at Colombey-les-Deux-Eglises, Marne, he continued to direct the R.P.F. in which a serious breach appeared on July 8, 1949, when Paul Giacobbi, Radical deputy and chairman of the R.P.F. intergroupe1 in the National Assembly, resigned both the chairmanship of the intergroupe and membership of the R.P.F. executive council. In Paris, on March 29, de Gaulle said that there was not a "third force," but only Communists and non-Communists. At Saint-Malo, on Aug. 1, he insisted that if the North Atlantic treaty were to be effective the defence of France must be properly organized. At Versailles, on Oct. 2, he asked for new elections and expressed his confidence that there was a majority in France for a regime worthy of her. At a press conference held in Paris on Nov. 14, de Gaulle sounded a new note when he declared that the unity of Europe should have been built round a directly negotiated Franco-German settlement, based on their community of cultural and economic interests.

GEMS. The situation created by wartime restrictions on imports and supplies did not appear to improve in 1949. Perhaps, owing to a slight weakening in demand early in the year, the values of poor and medium quality goods eased further, yet that of specimen pieces continued to harden.

The immediate result of the devaluation of the pound in September was an appreciable increase of prices in all grades so that perfection goods became exorbitant in price and the year closed without revealing any indication that peak values had yet been reached. Retail sales gave no sign of the commencement of the anticipated slump, although retailers in general continued their endeavours to reduce stocks to the pre-1947 level.

The greatest gemmological interest of the year centred upon synthetic gemstones, produced by experiments carried out in the U.S.A., where, as a direct result of wartime necessities, synthetic star-sapphire and synthetic rutile had been produced. Specimens of the latter were exhibited in 1948 in England, where the asterias were only known through their descriptions in American reports. Even in the U.S.A., however, technical difficulties in production made it impossible to market these stones commercially and it was reported that production costs were too high for mass manufacture to be contemplated. The few specimens of the rutile that were examined were in private collections and would most certainly not be marketed. They were most remarkable stones, perfectly transparent and possessing such extraordinary strong colour dispersion that the fundamental yellow colour was partially masked. The synthetic star-sapphire was reported to possess a perfectly defined six-pointed star that was thought to be caused by the interference of light set up by its reflection from properly orientated needle-like inclusions of synthetic rutile. The determination of either gemstone presented no difficulty. The synthetic rutile was unlike any known form or colour of the natural crystal, and the synthetic sapphire was reported to contain the characteristic internal features typical of the usual product of the inverted blowpipe and distinguishable from the blemishes of natural specimens. The usual slight regularities, characteristic of the natural asterias, were missing and the synthetic product might be suspected by the brightness and intensity of its star. (See also Mineralogy.) (F. E. LK.)

GENETICS. During 1949 the interest of many geneticists was concentrated on the problems of cytoplasmic heredity, and the relations between hereditary units in cytoplasm and nucleus. A number of contributions to this subject were published in a symposium volume entitled Unités biologiques douées de continuité génétique, in which various kinds of self-duplicating particles, other than genes, were described, in such diverse forms of life as viruses, bacteria, protozoa, green plants and Drosophila. Nevertheless much doubt still existed regarding the reality of some of these particles.

Boris Ephrussi reported the results of his extensive investigation into the character petite colonne in yeasts. This mutation occurred spontaneously in some species with a frequency of 1%, but much more often (to 100%) in cultures treated with acriflavine. The mutation was found as often in haploid as in diploid cultures, and breeding experiments failed to establish a Mendelian determination of the trait. It was therefore concluded that a form of cytoplasmic heredity was involved. Physiological studies showed that the mutants were able to utilize an exogenous substrate (glucose) only by a fermentative path, and this was evidently connected with the fact that the mutants showed no activity of the enzymes cytochrome oxidase or succino-dehydrase. It was further found that the activity of succino-oxidase (in normal cells) was bound to some large granules separable by centrifugation. The genetical study of this mutant and the transformation of populations of yeast by acriflavine treatment led to the hypothesis that there exists in the cytoplasm of normal yeast cells a self-reproducing corpuscular factor, whose loss or mutation produced the mutant cells.

Further progress was made on the study of the cytoplasmic factor or genoid in Drosophila melanogaster, rendering flies sensitive to killing by carbon dioxide. L. Goldstein obtained evidence of a mutant genoid, differing from that previously known in its transmission through the male germ cells. The new mutant was never (or with extreme rarity) transmitted through the male, whereas the original genoid was regularly transmitted in a certain proportion of cells. The new type was obtained by injecting hemolymph from the old sensitive ebony strain (σ-e) into a white strain (σ-w).

The rapidly developing subject of chemical mutagenesis was surveyed by Charlotte Auerbach. Additional data were accumulated on the effects of mustard gas and nitrogen mustard on Drosophila, Neurospora, bacteria and other organisms. In general the effects of these substances were found to be similar to those of X-rays, though the chemicals produced a smaller proportion of large deletions and translocations than X-rays. An effect characteristic of mustard gas was the production of delayed mutations. Other substances proved to be mutagenic were: phenols (visible mutations in Antheridium, autosomal lethals in Drosophila and chromosome disturbances in Allium); urethane, especially when mixed with potassium chloride (translocations in Onothera and mutations in Drosophila); formalin, when mixed with the food (Drosophila); and hydrogen peroxide, when added to the medium (bacteria).

A discovery which might prove of outstanding significance in the study of the mutagenic effect of radiations was made by A. Kelner and confirmed by R. Dulbecco. It was found that conidia of the actinomycte Streptomyces griseus, after having been inactivated by treatment with ultra-violet radiation, could be revived by subsequent exposure to visible light. The effect was readily reproducible and uniform, and resulted sometimes in a 400,000-fold increase in number of survivors in an ultra-violet irradiated suspension. The re-activation effect of visible light was proportional, within limits, to the intensity of the light and to the duration of exposure. The rate of reactivation increased with rising temperature from 20°C to 50°C. The photo-reactivation effect was also demonstrated with all seven of the T group of coli-bacteriophages, provided that the light treatment was applied to bacteria already infected by phage. The extent of
the photo-reactivation was specific for each phage type. No reactivation was observed when either the irradiated phage, or the bacteria, or both, were exposed separately to visible light before mixing. No photo-reactivation was observed with phage inactivated by X-rays.

A. D. Hershey and Raquel Rotman obtained further data on the recombination of bacteriophage traits during growth in a bacterium. Two types of phage character were studied in a T₅ group: (1) host range (h), or the ability to grow in bacteria of a particular kind, and (2) the rapid lysing types (r₁, r₂, r₃) characterized by a different plaque size. By infecting bacteria with two different types of phage simultaneously, new combinations of phage character were obtained after lysis, and the following recombination values were obtained: h × r₁ = 15 ± 6; h × r₂ = 7 ± 4; h × r₃ = 1 ± 1, where the figures given refer to percentages of either recombina-
tant in the total yield of phage. The authors developed a hypothesis according to which there was genetic interaction not between two phage particles but between two sets of independently multiplying chromosome-like bodies, or by something like crossing-over between homologous pairs.

Knowledge of the heredity of human blood groups was enlarged by the discovery of R. Race and others of a pair of alleles S and s very closely linked to the MN genes. No recombination was observed among 82 relevant children. This situation was therefore similar to the genetics of the white blood factor.

Books and articles by geneticists and others in western countries in both scientific and lay publications testified to the continued interest in the biological controversy in the U.S.S.R., where the school of T. D. Lysenko, denying the validity of genetics as based on Mendelism and the chromo-
some theory, was successful in attaining complete domination.

GEOGRAPHY. The year was notable for the holding of the 16th International Geographical congress at Lisbon in April. These congresses convened by the International Geographical union have served, since the first was held at Antwerp in 1871, to bring together from all over the world those whose subject of study is the world itself. In the past they initiated such projects of general utility as the international map of the world on the scale of one to a million (about 16 mi. to the inch). The congress of 1949 renewed the continuity of the series which had been interrupted for 11 years by World War II and the Portuguese government and Portuguese geographers deserved the thanks of all for their tenacity in completing the arrangements in face of postwar difficulties and the disappointments which led to the congress' postponement in 1938. The congress was opened and revealed a continuing activity in all branches of the subject during the difficult years since the last meeting at Amsterdam in 1938; years in which there had been little or no contact between workers in different lands. As far as the congress can be said to have had a single dominant theme, it was the necessity for understanding and making known the pattern of our human habitat, so significant in the application of science and technology. Among the new commissions set up at the congress was one for the employment of the international map to portray a wide variety of geographical distributions, in particular, the distribution of the world's population; other new commissions were to study world land use, regional planning and soil erosion. Their work should be reflected in the discussions at future congresses; the next was to be held in the United States in 1952, under the presidency of Professor George B. Cressey of Syracuse university. The retiring president, Professor Emmanuel de Martonne, was nominated honorary president of the geographical union for life in recognition of his long association with its activities.

Other congresses notable for their geographical bearing included the meeting of the British Association at Newcastle-upon-Tyne where section E (Geography) displayed much the same emphasis on land use and the human habitat. A congress was held at Johannesburg at which representatives from African countries and from states having commit-
ments in Africa met to discuss the development of the territories of that continent. The seventh Pacific Science congress which met in New Zealand in Feb. 1949, though not primarily geographical, deliberated the problems of the Pacific environment in very much the same terms and research programmes were formulated similar to those adopted at Lisbon. A United Nations Scientific Conference on the Conservation and Utilization of Resources was convened in New York during August and September.

Another international congress, on an aspect of geography less obvious in its practical importance, met in Brussels to discuss geographical names. Yet the practical problem of arriving at a set of agreed place names is very real and, with the rapid extension of international relations, immediate. It might appear sufficient to use for each place the name by which it is known locally but even that name is often ambiguous and inadequately recorded; it can hardly be suitable for cartographical or postal use unless it has been trans-

terated into a script that is generally understood and it may exist only in a language that has never been reduced to writing. Many countries, for example Germany (to use the English form), have well established but widely different names in the languages of their neighbours. These problems were discussed at the conference, though no final conclusions were reached. There were also papers on the fascinating subject of noms de lieux-dits, the names of fields and other parcels of land which, though seldom of more than extremely local currency, enshrine much historical and topographical information.

The development of the world's untapped resources, which loomed so large in the proceedings of the congresses, found its expression in the inception during 1949 of a number of important undertakings which cannot but be of interest to geographers. Work was begun in October on the first of a series of dams which would divert the headwaters of the Snowy river through tunnels beneath the Australian Alps to join the Murray river. The diverted drainage would furnish abundant hydro-electric power and, perhaps of greater importance, it would augment the area of the Murray irriga-
tion in the dry interior of the continent. The Australian Alps intercept the rain bearing winds from the Pacific, standing between the relatively well watered but mountainous coasts of New South Wales and Victoria and the relatively dry, desert like plains of the Murray valley; the dams and tunnels were to restore to the plains some of the moisture they might have enjoyed had they not been shadowed by the mountains.

The Nile has long been controlled in the interests of Egyptian irrigation; but the growing area of cultivation and the requirements of the Sudan have called for ever increasing storage capacities in the Nile reservoirs. A plan was authorized during 1949 by the Egyptian government for the control of the White Nile at the point where it issues from Lake Victoria at Jinja in Uganda. The dam at the Owen falls would serve to generate hydro-electric power, and the con-
trolled level of the lake would ensure a greater regularity in the flow of the Nile, averting the floods and droughts equally disastrous to Lower Egypt. To reduce the losses by
evaporation it was proposed to construct a canal to bypass the papyrus swamps of the Sudan. A similar control of the Blue Nile at its point of issue from Lake Tana was envisaged. A point of interest was the effect which the more regular flow of the White Nile must have on the cattle-breeding tribes of the Sudan who, though they did not use its water for irrigation, depended on its periodical inundations for their pastures. This led to an investigation into the characteristics of river cross-sections.

The African groundnut scheme scarcely fulfilled its early promise and the report published by the British government in Nov. 1949 provided sober reading on a venture entered upon with enthusiasm but with an inadequate assessment of the geographical factors involved.

Even in normally well watered lands the exceptional weather of the year provoked a more than academic interest in the problems of water supply. In point of long standing records broken, it was a matter for the admiration of meteorologists. The greater part of western Europe experienced a long and almost rainless summer and a disastrous drought prevailed in Spain; on the other hand it was unusually wet and cold in Iceland and northern Scandinavia. A similar anomalous translation of climate was experienced on the eastern and western coasts of North America. In England there was concern for public water supplies and the flow of the Thames over Teddington weir became a feature in the newspapers; not only did it threaten the Londoner with a curtailed supply but it presented the Port of London authority with the problems of a polluted river. The possible consequences of climatic fluctuation were brought home to the geographer and it was seen that in a highly urbanized community, even in a temperate clime, water might become a limiting factor in the planning of towns and industries.

Since the great achievements of the 18th century, navigation had been an established rather than an actively growing branch of mathematical geography; but 1949 might be considered notable for two discussions held by the Institute of Navigation in London: the first on the use of radar at sea and the second on astronomical navigation in the air. Practical navigators met to discuss the limitations of the techniques now established and the fields, where knowledge was incomplete, for further investigation.

The political geographer saw fewer formal changes to his map of the world in 1949 than in previous postwar years, but the inclusion of Newfoundland in the dominion of Canada came into effect, having been decided by referendum in 1948. In the East Indies, the transfer of sovereignty from the Dutch crown to the new republic of the United States of Indonesia took place on Dec. 27. The city of Batavia was renamed Jakarta. During the year Transjordan was renamed Jordan; Iran, Persia; and Siam, Thailand.

GEOLOGY. An exhibition of the work of colonial geological surveys held at the Imperial institute in July illustrated geological mapping in relation particularly to mineral wealth and water supplies. Also in July the fourth Empire Mining and Metallurgical congress met in London and Oxford. Papers with special reference to South Africa, Australia and Canada were read on modern mineral prospecting methods such as aerial photography and various geophysical and geochemical means; also on radioactive measurements in the search for radioactive minerals.

The British Association for the Advancement of Science met in Newcastle-upon-Tyne. Professor Hans Petterson gave an account of the cruise of the "Albatross" which aroused wide interest. Two hundred long cores were taken of sediments at depths between 2,000 and more than 4,000 fathoms, their combined length exceeding one mile. Continuous echo-sounding records were obtained showing the profile of the ocean-floor which was in some places very irregular. Records of explosives in water at depths between 300 and 3,500 fathoms enabled the hard floor below the soft sediments, or the "bottom below the bottom," to be determined. It was thus found that the thickness of soft sediments in the Atlantic ocean was up to 12,000 ft., whereas in the Indian and Pacific oceans it was less than 1,000 ft. It is possible that lava flows in past times gave a "false" bottom and thus concealed the full thickness of sediments. Methods were suggested which might throw light on the age or chronology of the sediments represented by the cores. The radium content of sea water is less than that in equilibrium with the uranium but that of the very deep sea sediments is fairly high. It was supposed therefore that an intermediate product (ionium) in the uranium-radium reaction chain might be largely precipitated. Hence analysis of the various layers might be expected to give their relative ages. Also the species of Foraminifera in the Globigerina oozes varied in different layers and the variation was apparently related to the temperature of the water in which the species lived which suggested that it might be possible to identify past climates such as glacial conditions in these sediments. (See F. B. Pfleger, Bull. Geol. Soc. Am., vol. 60, 1949.)

In Section C (Geology), in a discussion on the education of a professional geologist, it was agreed that a post-graduate course of specialized training was beneficial. The president of section C (Professor W. J. Pugh) reviewed recent work on the Lower Palaeozoic rocks of Great Britain.

Recent geological work of general interest. A. Holmes (Geol. Mag., London, July-Aug. 1949) reviewed the ages of certain uraninites and monazites from the pre-Cambrian rocks of India and concluded that they represented two cycles of igneous action—one about 735 million years ago and the earlier about 900 million years.

E. C. Bullard (Veröffentl. des Finnischen Geodätischen Institutes, Helsinki, no. 36, 1949) discussed the age of the earth from the examination of radioactive and isotopic contents of lead in lead ores of various ages—a method which was suggested by A. Holmes. He arrived at a figure of the time which has elapsed since the crust of the earth solidified of 3,290 ± 200 million years.

O. T. Jones and W. J. Pugh (Quart. Journ. Geol. Soc., pt. 1, London, 1949) described an early Ordovician shoreline in Radnorshire near Builth Wells, Wales, which was still in a remarkably good state of preservation in spite of its great antiquity.

P. E. Kent (Proc. Geol. Assoc., 1949) published a structure contour map based on numerous borings, showing the depths to the rocks which are older than the Permian. It showed four great depressions or basins filled with new red sandstone (Permian and/or Trias). The Solway basin exceeds 4,500 ft., the west Lancashire basin and the Cheshire basins are each more than 6,500 ft. and the Severn basin about 3,500 ft. The pre-Permian rocks in the Hampshire basin were believed to descend to about 12,000 ft. below the surface.

Hallam L. Movius, Jr. (Journ. of Geol., Chicago, July 1949), described the stratigraphy of the Villafranchian in southern and southwestern Europe. The main conclusions were: (1) the Villafranchian deposits overlie Upper Pliocene and are immediately overlain by deposits of the first interglacial period (Cromer Forest beds); (2) they were laid down during a period of deterioration of climate (temperature) which heralded the first glacial stage. The Villafranchian is therefore Pleistocene and it was indicated in the correlation table that the newer red crag of East Anglia belongs to this
stage. An important review of Pleistocene research was published by the Geological Society of America (Bull., vol. 60, Sept. 1949).

Geomorphology. E. S. Hills (Geol. Mag., May-June, 1949) traced the development of ideas regarding the mode of formation of shore platforms. He considered that weathering at water level of rocks of various kinds, organic agencies and cementation might each have an effect in addition to the normal wave erosion in shaping these platforms.

L. E. King (Geol. Mag., July-Aug., 1949) discussed the Piedmont problem with special reference to South Africa and considered that the feature was developed by sheet flow of water along the foot of highland areas.

C. A. M. King and W. W. Williams (Geog. Journal, 1949) investigated the movement and formation of sandbars by wave action. This work arose out of wartime observations on the distribution of sand under the shallow waters off enemy-held beaches which were also supplemented by tank experiments.

Economic. O. T. Jones (Geol. Mag., 1949) discussed the volatile contents of coal seams and considered them to be the consequence of their former depth of burial. It was believed that the temperature at a depth promoted the loss of volatiles from vegetable matter, that pressure retarded it and the rate of sedimentation during the later stages of the coal measures might also have to be taken into account.

Historical Geology. Two outstanding textbooks appeared—Introduction to Historical Geology by R. C. Moore and Historical Geology by C. O. Dunbar. In Germany, Roland Brinkmann’s revision of Emanuel Kayser’s Abriss der Geologie, Part 2 of Historiesche Geologie, was issued. A. J. Eardley’s valuable paper on “Palaeotectonic and Palaeogeologic maps of Central and Western North America,” was published in the May issue of the Bulletin of the American Association of Petroleum Geologists.

Stratigraphy. A realization of the importance of facies changes in both pure and applied geology resulted in the publication of a symposium on the subject in memoir 39 of the Geological Society of America, based on a conference held under the chairmanship of C. R. Longwell. “Sedimentary Facies in Gulf Coast” was the subject of a far reaching paper by S. W. Lowman in the Dec. 1949 issue of the Bulletin of the American Association of Petroleum Geologists.

Structural Geology. In his presidential address before the Geological Society of America, published in the April Bulletin, James Gilluly attacked the widely accepted concept of the periodicity of mountain-building movements.

Petrology and Petrography. The problem of granitization dominated the field of igneous petrology. The November issue of the American Journal of Science carried a review of the problem by R. A. Daly. The research of internal Structure of Granite Pegmatites” by E. N. Cameron and others appeared as monograph 2, Economic Geology. The crystalization of a magma from the walls inward was considered to be the cause of zoning in these rocks. Sedimentary Rocks, by F. J. Pettijohn, represented an outstanding addition to the literature on geology. Continued interest in research on clays was indicated by several articles. In the January issue of American Journal of Science, C. M. Gilbert and F. J. Turner advocated universal stage techniques for the study of sedimentary rocks. In a brief article in Science for Feb. 18, W. H. Newhouse and others set forth a hypothesis for structural (planar) control of migrating chemical elements in metamorphic processes.

Applied Geology. Two main trends continued to dominate the study of metallic ore deposits: structural control and wall rock alteration. The former had received attention in the excellent Structural Geology of Canadian Ore Deposits (1948) by a number of authors, and the latter was the subject for a symposium at the 75th anniversary celebration of the Colorado School of Mines, Golden, Colorado. Rock Alteration as a Guide to Ore-East Tintic District, Utah, by T. S. Lovering and others, was published as monograph 1, Economic Geology. As an aid to prospectors for radioactive ores, numerous handbooks were published by governmental agencies. Prospecting for Uranium (U.S. Atomic Energy commission) and Prospector’s Guide for Uranium and Thorium Minerals in Canada (Bureau of Mines, Canada) were examples.

The second edition of Géologie des Gîtes Minéraux by E. Raguin seemed valuable for a general study of mineral deposits. Examination and Valuation of Mineral Property, 3rd ed., by R. D. Parks, also merited the attention of mining engineers and geologists. A revival of interest in research on the geology of coal was evidenced by several excellent papers by R. E. Cady and others in Economic Geology and by a coal research symposium at the meeting of the Geological Society of America in El Paso, Texas.

Among petroleum geologists the interest in reef limestones as reservoirs for oil and gas increased rapidly as a result of discoveries and extensions of such types of pools in Alberta, Canada, and in the Permian basin of west Texas. Three new text and reference books in the field of petroleum geology appeared: Subsurface Geological Methods, a symposium by 42 contributors, compiled and edited by L. W. LeRoy and H. M. Crain, and published as a quarterly by the Colorado School of Mines; Principles of Petroleum Geology by C. G. Lalicker; and Oil Fields in North America by W. A. Ver Wiebe. (See also MINERALOGY; PALAEOLOGY; SEISMOLOGY.)

GEORGE VI, king of Great Britain, Ireland, and the British dominions (b. York cottage, Sandringham, Dec. 14, 1895). During 1948 plans were announced for a royal tour of Australia and New Zealand in 1949 by the King, the Queen and Princess Margaret; but on Nov. 23, 1948, it was announced that the King was suffering from obstruction to the circulation of the right leg and that on medical advice he was postponing the visit. (See Encyclopaedia Britannica and Britannica Book of the Year 1949).

On March 12, 1949, an operation of lumbar sympathectomy was performed in Buckingham palace by Professor J. Learmonth (who was later invested a knight commander of the Royal Victorian order). The King made good progress and at the beginning of April went to Royal lodge, Windsor. He returned to London to entertain the Commonwealth ministers on April 21 and on May 3 entertained the European foreign ministers who were in London for discussions on the constitution of the Council of Europe. On July 14 he received the Commonwealth finance ministers who were meeting in London. On June 9 he attended the topping of the colour parade on the occasion of the official celebration of his
birthday in a semi-state landau instead of on horseback, and later in the same month he officially inaugurated "Colonial Month" at a ceremony at Church house, London. As colonel in chief of the Irish Guards he presented new colours to the 1st battalion of the regiment at Buckingham palace on July 27. On Aug. 3 he received the chiefs of staff of the

cideration to the opposition, however, would be given. "In times such as these," he said, "we should not indulge in the luxury of tearing each other to pieces in internecine struggle."

GERMAN LITERATURE. The only remarkable book connected with Goethe's centenary did not, in fact, come from an author in Germany but from Karl Victor, a literary historian, who for more than ten years had been teaching German literature at Harvard university. His Goethe: Dichtung, Wissenschaft, Weltbild, published in Switzerland, dealt with the intellectual and external influences that affected Goethe and found expression in his work and in his humanistic attitude to life.

There was a noticeable tendency among German critics rather to return to the "eternal treasure" of old poetry and prose than to discuss topical problems. In 1949 the attention of the younger generation was drawn to Gottfried Keller whose novels and stories expressed the bourgeois ideals of the 19th century for which a certain nostalgia was felt; Erwin Ackermann's Gottfried Keller: Geschichte seines Lebens traced the stages of the writer's literary development. Among other essays Hölderlin und die Landschaft by Romano Guardini, a Roman Catholic philosopher, was a masterly study which showed how the landscape in Hölderlin's poetry changed from romantic to classical and, finally, as his madness progressed, became chaotic. Helmut Wocke's Hölderlin's christliches Erbe, however, was unconvincing in its attempt to show the influence of Protestant theology on the poet's thought. Perhaps the most comprehensive work in this category was Professor Ernst Robert Curtius' Europäische Literatur und lateinisches Mittelalter which was an illuminating and scholarly history of the sources of European literature.

In poetry, Stephan Hermlin's 22 Balladen struck a new note; but the best that could be said of Rudolf Hagelstange (Strom der Zeit), Karl Ludwig Skutsch (Dichterische Weisung) and Horst Lange (Gedichte aus zwanzig Jahren) and other poets such as Alexander Lernet Holenia and Werner Berggrün, was that they followed the tradition of Hugo von Hofmannsthal, Stephan George, Rainer Maria Rilke and certain classics without adding anything fresh and truly moving. Postwar German poetry remained a civilized but barren desert. The publication of Karl Zuckmayer's Gedichte 1916-1948, especially the poems written in the 1920s under the influence of Arthur Rimbaud, was welcomed.

There was more promise among young fiction writers. Ursula Risse's volume of short stories, Verwehner Sommer, was a curious mixture of fairy tale and existentialist thought. Her religious feeling and concern with mankind's fate suggested that she might become a significant writer. Herman Hakel's Zwischensituation, a collection of sketches and poems in prose, showed that he needed first to free himself from Franz Kafka's influence with its hopeless resignation. Grete Weil's short novel Ans Ende der Welt, a love story set among Jews condemned to be deported to the gas chambers, marked the new generation in literature. Werner Richter's Die Geschlagenen was a war novel which, however, had to be counted a failure. The unfinished third volume of Robert Musil's great novel, Der Mann ohne Eigenschaften, was published. Thomas Mann's Die Entstehung des Dr. Faustus, with the soul of a creative artist and the forces that struggle to possess it as its central theme, was eagerly read, although this work by Germany's greatest living writer did not altogether fulfil the high expectations it had aroused. (J. K.)

GERMANY. A country of central Europe, bounded on the north by the North sea, Denmark and the Baltic sea, on the east by Poland, on the south by Czechoslovakia,
Austria and Switzerland, and on the west by France, Luxembourg, Belgium and the Netherlands. According to a declaration signed in Berlin on June 5, 1945, the country was under the supreme authority of the four Allied powers—the United States, Great Britain, the U.S.S.R. and France—and divided into four following zones:

Source: Statistical Bulletin of the Control Commission for Germany (British Elements)

* Excluding the Saar (area, 734 sq. mi.; pop. 874,400).
* Including some small German frontier areas which, as agreed upon under the six-power agreement of March 26, 1949, were taken over by Belgium, Luxembourg, the Netherlands and the Saar respectively (total area, 52 sq. mi.; total pop., about 13,500).

Before the Anschluss of Austria the area of Germany was 181,677 sq. mi. with a population (May 17, 1939, census) of 69,317,000. The British, Soviet and U.S. zones contained larger populations than in 1939; by 1946 the zonal increases were: British zone 12-9%, Soviet 14.4%, U.S. 20.5%. The additional inhabitants were mainly Germans evacuated or transferred from Poland and Czechoslovakia. Only the population of the French zone was less (3-5%) than in 1938. Chief cities (first figure, 1939 census; second figure, 1946 census): Berlin (43,342,223; 3,180,383); Hamburg (1,711,877; 1,406,158); Munich (829,318; 738,018); Cologne (772,221; 489,812); Leipzig (707,365; 608,111); Essen (666,743; 520,592); Dresden (630,216; 463,032); Frankfurt-on-Main (553,464; 389,097); Düsseldorf (541,410; 421,506); Dortmund (542,261; 436,198); Hanover (470,950; 347,040).

Language (1946 est.): German with small admixtures of Lusatian (260,000 in Kottbus-Bautzen area), Polish (150,000, mainly in Westphalia) and Danish (17,000). Religion (1938 est.): Protestant 62.7%; Roman Catholic 32.5%; Jewish 0.7%; others 4.1%.

During the year Germany was virtually partitioned into two states with a special provisonal regime for Berlin (q.v.).

Western Germany. Area, 46,634 sq. mi. Pop. (June 30, 1949, est.): 47,254,900 which indicated an increase of 2,731,600 since Oct. 29, 1946; only during the first six months of 1949 the population of western Germany increased by 407,000 including 105,000 returning prisoners of war and 162,000 refugees from the Soviet zone. Capital: Bonn (q.v.). President of the German federal republic, Dr. Theodor Heuss (q.v.); federal chancellor, Dr. Konrad Adenauer (q.v.); Allied high commissioners: British, Sir Brian Robertson; French, André François-Poncet (q.v.); U.S., John J. McCloy (q.v.). Allied commanders in chief in Western Germany: British, Lieutenant General Sir Charles F. Keightley; U.S., Lieutenant General Clarence R. Huebner; French, General A. Guillaume.

Eastern Germany. President of the German Democratic republic, Wilhelm Pieck (q.v.); prime minister, Otto Grotewohl (q.v.). Soviet Control commission: Army General Vasily Ivanovich Chuykov (q.v.), chairman; Ivan Fedorovich Semchastnov, deputy chairman; Vladimir Semenovich Semenov, political adviser.

History. The establishment of a West German Federal republic and of an East German Democratic republic in 1949 marked the final stage of the partition of Germany. The three western Allies, despite many disagreements, maintained a common policy of progressively handing back to Western Germany her sovereignty and of modifying and reducing the restrictions and limitations on her industry. The remaining restrictions were to be supervised by the Ruhr authority and the Military Security board.

The Ruhr statute which was published by the three western Allies in Dec. 1948 laid down that a Ruhr authority was to allocate coal, coke and steel, prevent discriminatory trade practices and safeguard foreign interests in the Ruhr. It was to consist of 15 members (3 U.S., 3 British, 3 French, 3 German, and one from each of the Benelux countries). The German political leaders protested energetically against the Ruhr statute on the grounds that it would be used to prejudice Western Germany’s competitive position and that such control could only be justlfyed if its authority were extended over the whole of western Europe’s heavy industry.

On Jan. 17 the Allied Security board was set up, consisting of Major General James P. Hodges (U.S.), Major General V. J. Westropp (Great Britain), General Etienne Paskiewicz (France). Its sphere of responsibility was to be prevention of military organizations, of the manufacture or import of arms, and of war preparations through scientific research.

Major political and industrial concessions to Western Germany which had been busily discussed in London during the first two months of the year became accomplished facts in April and May. On April 13, in Washington, the three western ministers of foreign affairs signed an agreement under which 150 industrial plants scheduled to be dismantled were to be struck off the dismantling list. The following production quotas were authorized in the case of the industries forbidden in 1945: ball-bearings 33 million units a year; aluminium 85,000 tons a year; styrrin 20,000 tons a year. All synthetic petrol and synthetic rubber plants were to be dismantled with the exception of the Wesseling hydrogenation plant. Aircraft construction remained forbidden.

German Federal Republic. On May 8 the Basic law or constitution for the West German Federal republic was agreed by the parliamentary council of 65 members which had been elected by the state (Lander) parliaments in Oct. 1948 and which had been drafting and debating this constitutional document for eight months at Bonn. Twelve votes were cast against the Basic law: six by the Bavarian Christian Social union and two each by the Centre party, the German party, and the Communist party. The final adoption was preceded by an anxious two months of debate and negotiation between the leading West German political parties and the Allied authorities. In general the Western Allies favored in varying degrees a constitution which would establish a highly decentralized federal state. The Christian Democratic union were also in favour of concentrating more power in the hands of the individual states (Lander) than was thought desirable by the Social Democratic party who anticipated that without a higher degree of centralism the social reforms which they advocated could not be implemented. The most contested field was finance. A deadlock between the viewpoint of the western authorities and that of the Social Democratic leaders developed. On April 22 this was resolved by the Allied military governors handing over to the parliamentary council a letter from the three western foreign ministers which made the following concession in the direction of greater centralism: the federal government could claim—in addition to revenue from customs, monopolies, consumers’ taxes, turn-over tax and property-tax—part of the revenue from income-tax and corporation tax; this additional revenue would be used to subsidize education, health and welfare in the poorer states.

The Basic law, which finally emerged and was adopted, provided for a two-chamber system consisting of a Federal Diet (Bundestag) to be directly elected every four years and a Federal Council (Bundesrat) consisting of members of the individual state governments. The states were to have three to five representatives in the Federal Council, according to their population, but each state delegation was to have one
In 1949 two German governments were set up. In Eastern Germany the people's council in Berlin (1) declared itself a provisional parliament on Oct. 7, and Wilhelm Pieck (2) was elected president. In Western Germany Theodor Heuss (3) was elected president on Sept. 12 when he received 416 out of a total 804 votes cast by both houses of the parliament (4), which met at Bonn.
vote only. The principal powers of the Federal Council consisted of the right to demand that a joint commission of the Federal Diet and the Federal Council should debate any given law, and of the right of veto. The Federal Diet could, however, overrule the council's veto by an absolute majority. The federal president was to be elected by a federal assembly consisting of the Federal Diet and 400 delegates elected by the state diets (Landtage); he was to propose the federal chancellor who would then select his ministers. Implementation of the federal government's laws was to be in the hands of the states, except in the following fields: foreign affairs, federal finance administration, post, inland waterways and shipping, federal railways, frontier control and criminal police.

Most interesting of the clauses of the Bonn constitution were two aimed at eliminating weaknesses in the constitution of the Weimar republic of 1919-33 which had led to the destruction of democratic government. The first was article 21 which ruled that "parties which by their aims or the behaviour of their supporters are calculated to damage or destroy the fundamental free democratic order are unconstitutional." The other, Article 67, to prevent party groupings in the legislature from following negative and irresponsible courses — laid down that the Federal Diet could only pass a vote of no-confidence in the chancellor if it chose a successor by means of a majority of its members and asked the president to dismiss the chancellor. According to the Basic law, Berlin was named as part of the West German Federal republic, but the three Allied military governors did not agree to the admission of the former capital in practice because of their desire not to embitter relations with the Soviet Union still further.

On Aug. 14 elections for the Federal Diet were held throughout the three western zones of Germany. Out of the 402 seats contested the Christian Democratic union allied with the Christian Social union won 139, the Social Democratic party 131, and the Free Democratic Liberal party 52 seats. The elections were fought with some bitterness, and the leading parties' chief bid for electoral support consisted in violent attacks on the occupying powers, particularly for their policy of dismantling (see ELECTIONS).

On Sept. 12 Dr. Theodor Heuss was elected federal president and on Sept. 20 Dr. Konrad Adenauer, the leader of the Christian Democratic union, formed a coalition government based on the C.D.U., the F.D.P. and the D.P. Note-worthy in Adenauer's first speech as federal chancellor was his declaration that Western Germany would not accept the Oder-Neisse frontier, which marked the border of the eastern territories annexed by Poland and the U.S.S.R.

On the day following the formation of the West German government the western military governors made over to it extensive new powers. These were defined in an Occupation statute which placed all governmental authority in German hands, with the exception of the following reserved fields: disarmament and demilitarization; Ruhr control, reparations, decartclli/ation, trade discrimination and foreign interests in Germany; foreign policy, displaced persons and admission of refugees; the prestige and security of Allied occupation forces; the safeguarding of exchange rates; control of internal affairs to ensure that money and food would be used so as to minimize aid from abroad; custody of people arrested or sentenced by occupation courts.

The three occupation authorities retained the right to resume full powers if necessary for security, for the maintenance of democratic government or for fulfilling international obligations. They also retained a right to veto any law within 21 days of receiving it, but pledged themselves only to exercise this right in the case of a law conflicting with the Basic law, with the state constitutions, the Occupation's laws, the Occupation statute, or the basic aims of the occupation. Provision was made for a review of the Occupation statute within 18 months after coming into operation.

The three military governors were re-named high commissioners to function as a unity in an Allied High commission which would not deal with German authorities below the level of the federal or state governments, except in the field of the reserved subjects.

Against this background of constructive political concessions Western Germany still had to face in 1949 two punitive measures in exactation of reparations: the first was provisional frontier rectifications at Germany's expense, the second the continuance of dismantling of industrial plants. The provisional frontier rectifications carried through on April 23 for the benefit of Holland, Belgium, Luxembourg and the Saar were very small. Only 52 1 sq. mi. and 13,500 German inhabitants were involved, but the West German political leaders and press attacked the unilateral rectifications bitterly as violations of the clause of the Atlantic charter in which the Allies had foresworn territorial annexations.

West German resistance to industrial dismantling reached a climax in the summer when the synthetic petrol plants in the Ruhr were dismantled. At Bergkamen and Ruhr-Chemie, Oberhausen, Allied troops had to occupy the factories before dismantling could proceed (June 12 and Sept. 3), and on July 29 six dismantling workers who had refused to dismantle at the Dortmund Paraffinwerke were sentenced to two months' imprisonment, though subsequently released on good behaviour. Two workers of the same plant received prison sentences of five months and three weeks for assaulting a dismantling contractor, Erwin Muller (Sept. 15).

During the Washington talks between the three foreign ministers in September Ernest Bevin suggested that dismantling should be terminated by Nov. 1. On Oct. 8 the U.S. high commissioner in Germany, in a new agency interview, urged the ending of the "senseless dismantling." The French government were less willing to make further concessions to Western Germany.

German Democratic Republic. In October the event occurred which made agreement upon further concessions by the western Allies to the West German republic politically urgent and therefore easier of achievement. A German Democratic republic was proclaimed in the Soviet zone.

Already on May 16 a People's congress (Volkskongress) had been elected in the Soviet zone and the Soviet sector of Berlin under a plebiscite arrangement, each voter having the chance to vote "yes" or "no" to a single zonal list of candidates, also to "the unity of Germany," the early conclusion of a peace treaty and the withdrawal of the occupation forces. It was announced that 92% of the voters had gone to the polls and that 66% of these had voted "yes" in this election, in which there was evidence of falsification and pressure. This People's congress elected a People's council (Volkerrat) of 400 which was transformed on Oct. 7, at a meeting in the former Air Ministry in Berlin, into a provisional People's Chamber (Volkskammer) for the new republic. A Chamber of the States (Länderkammer) was nominated three days later and on Oct. 11 the two chambers elected Wilhelm Pieck president of the Democratic republic. Half a million people marched past the new president in a torchlight procession. Otto Grotewohl, of the S.E.D. (Socialist Unity) party, formed a provisional government of 7 S.E.D. ministers, 3 from the Liberal Democratic party, 4 from the Christian Democratic union, 1 from the National Democratic party, and 1 from the Democratic Farmers' party. The key ministries — interior, justice and deputy premiership — were in the hands of the S.E.D. (Communist) ministers Karl Steinhoff, Max Fechner and Walter Ulbricht. At the same time (Oct. 10) General V. I. Chuykov announced that a Soviet Control
commission would replace the Soviet Military administration whose administrative functions would be transferred to the German provisional government. On Oct. 16 Gheorghy Pushkin was appointed Soviet ambassador to the new German Democratic republic and Rudolf Appelt was sent as German representative to Moscow.

On Aug. 20 Wilhelm Pieck had announced that the Soviet zone government would claim to represent all Germany, and on Oct. 21 the Western German chancellor answered by declaring: "Only the West German Federal republic has the right to speak for the German people."

The façade of concessions by the Russians to the Germans in their zone of Germany undoubtedly spurred the western Allies to improve the status of the West German republic. At a conference of the three western foreign ministers in Paris (Nov. 9-11), agreement was reached on a number of offers to be made to the West German government in return for its co-operation in the Ruhr Control authority and with the Military Security board. On Nov. 22 a protocol was signed at Petersberg by the three Allied high commissioners and the West German chancellor under which, in return for full German co-operation with the Ruhr authority and the Military Security board, dismantling was suspended of all except 11 plants. German consulates and trade missions were to be established abroad and Germany's participation in international organizations and in the Council of Europe was to be promoted. Her participation in the International Patent office at The Hague had been sanctioned on Nov. 17, and West Germany's representative had taken his place in the O.F.E.E.C. on Oct. 31.

International discussion as to whether Germany should be invited to join the new Council of Europe started in May 1949 when the statute of the Council of Europe was adopted and a clause was included providing for "association membership," that is, membership of the consultative assembly only, in the case of countries such as Western Germany which could not send a foreign minister to the Committee of Ministers.

At the first session of the Assembly of Europe in Strasbourg in August and September Winston Churchill energetically advocated West German membership but Robert Schuman, on behalf of France, laid down, as a pre-condition, that the Saar (q.v.) must also be admitted as a member. Churchill agreed that a Franco-German understanding on the Saar question was a prerequisite of Germany's admission. On Nov. 3 the West German chancellor stated in a newspaper interview that Western Germany would not refuse to enter the Council of Europe if the Saar were admitted. In this he was at variance with the Social Democratic party, whose leader, Kurt Schumacher, declared on Nov. 9 his opposition to the French proposal to admit the Saar. In November the committee of ministers meeting in Paris passed a resolution in favour of Germany's admission to the Council of Europe, and the way seemed open.

Behind the east-west tug-of-war over Western Germany and the mass of new constitutional documents and institutions which came into being in 1949, loomed, for the new federal government, three gigantic social problems: housing, unemployment and refugees. Five million new dwellings were required in Western Germany and the federal government planned a programme of 250,000 new dwellings for 1950; unemployment reached by Nov. 1949 a figure of 1,558,000; the total of refugees from the east in Western Germany was about eight million and was increasing at the rate of 1,000 a day in autumn 1949. Most of the refugees were embittered, impoverished and politically irreconcilable to the loss of their homeland. Many thousands of them were housed in congested camps. It was reliably estimated that DM.28,000 million would be required over a period of ten years to finance the businesses, agricultural holdings and dwellings necessary for the social and economic assimilation of the refugees.

In the first 10 months of the year about 240,000 German prisoners of war returned home from the Soviet Union. On Oct. 30 Wilhelm Pieck promised that the remainder would be repatriated by Jan 1, 1950. About 600,000 German prisoners of war and civilian prisoners still remained in the U.S.S.R. in December. (See PRISONERS OF WAR.) (D. A. SN.)

**Education.** In May 1938 Germany had 51,118 public elementary schools with 179,260 teachers and 7,586,413 pupils; 308 private elementary schools with 1,063 teachers and 24,783 pupils; 1,563 higher elementary schools with 9,582 teachers and 272,635 pupils; 2,319 secondary schools of several kinds with 671,000 pupils, 23 universities with 39,900 students and 44 other institutions of higher education with approximately 44,000 students. At the end of 1949 the latest available information on German education related to 1947-48 and this is summarized in Tables I and II.

Estimates.

In the table above the year 1936 is given as a measure of comparison
because the British and U.S. governments considered it a year of
neither boom nor depression. But German rearmament was already
in full swing in 1936. By 1938 Germany led the world in the production
of lignite (195 million metric tons, used mainly as ravv material for
synthetic petrol), coming second after the U S. in steel production
(23 million tons) and electricity and third after the U.S. and Great
But it had to import a
Britain in coal output (186-7 million tons).
large part of the raw materials needed for its industrial production.
At the time of the currency reform in June 1948 the general level of
industrial production was 51 % of the 1936 rate. The currency reform
proved to be a major economic stimulus and by Nov. 1949 the index
number of industrial production in Western Germany stood at 98%
of the 1936 level
Although employment in manufacturing in Nov.
1949 was 26% greater than the 1936 average, there were 1,558,000
as
against 831,500 in 1946.
unemployed
No precise statistical information was available for Eastern Germany
but general economic shortages prevailed there during the year. Textiles remained rationed. Clothes and shoes were virtually unobtainable
in many areas. Bartering of textiles for meat and fats still went on
Bread was scarce and of mediocre quality (66% flour compared with
80% in Western Germany). The trading organizations (HandelsOrgamzationen), special shops and restaurants selling at higher than
the prices of rationed goods, increased steadily in number, and by
Oct 1949 totalled 1,450. Reparations from current production delivered
to the Soviet Union by Eastern Germany and costs of the Soviet
occupation were as great as the occupation costs in all three western
zones added together. Official German statements on the two-year

plan for Eastern Germany, due to finish on Jan. 1, 1950, indicated

Finance and Banking. Before the currency reform of June 20, 1948,
the budgets of the Western German Lander were in balance. For the
first half of 1948 their total revenue amounted to approximately
Rm. 2,500 of which 30% was spent on occupation and other warinduced costs
After the currency reform revenue fell off sharply,
partly reflecting prepayment of taxes in anticipation of the introduction
of a new currency, partly because of tax evasion after the conversion
By March 31, 1949, the end of the fiscal year, the total deficit was
estimated at Dm. 600 million. By the end of the year the Bonn government had prepared the first interim budget of Western Germany for the
period Sept 21, 1949-March 31, 1950, totalling about Dm. 1,534
million. Balanced mainly by means of the contributions of the individual
Lander to the federal treasury, the interim budget could not have the
importance of the first normal budget for 1950-51 when the federal
government would have full control of its own revenue from taxation,
excise and other sources. It was estimated at Bonn that the revenue
of the 1950-51 budget would be
8,000 and the expenditure
10,100, including Dm. 4,535 million for occupation costs.
In Eastern Germany the 1950 budget estimates were as follows:
revenue Dm. 17,630 million, expenditure Dm. 17,526 million an
expansion of 10% in comparison with 1949.
Before the currency reform of June 1948, currency supply (notes and

Dm

Dm

deposits) in Western Germany amounted to about Rm. 150,000 million.
old Reichsmark balances of individuals were converted into new
Deutsche Mark accounts on the basis of Dm. 6 50 for
100. Accordto
the reports of the Bank Deutscher Lander the note circulation
ing
was Dm. 5,053 million by mid-Sept. 1948, and Dm. 7,279 million by
mid-Sept 1949. The Deutsche Mark did not have any official exchange
rate, but for practical purposes the Joint Export-Import agency fixed
a conversion factor at Dm.l^-U S. cents 30
On Sept. 28, 1949, after
the devaluation of the pound sterling, the conversion factor was
changed to Dm. 1 U.S. cents 23-8 which suggested a devaluation of
the Deutsche Mark to the dollar by 20-6%. The conversion rate for
the pound sterling was Dm.l
1 s. 6d. before and Dm.l
Is. 8 -4d. after
the devaluation. In the western sectors of Berlin there was a special
issue of about
(B) 400 million.

The

Rm

GHEORGHIU-DEJ, GHEORGHE, Rumanian politician (b. Bărlad, Moldavia, Nov. 8, 1901), of peasant origin, worked as electrician with the state railways administration until 1932, when he was dismissed for revolutionary activity. From 1929 he was a member of the clandestine Rumanian Communist party. In 1933 he took part in the organization of the Griviţa railway workshop strike, was arrested and, in 1935, sentenced to 12 years' imprisonment. He escaped from prison and represented the Communist party at meetings which led to the formation of the National Democratic front. From Oct. 1945 he was secretary general of the Workers' (Communist) party of Rumania (Partidul Muncitorilor din România) and in Sept. 1947 was one of the Rumanian delegates at the conference in Poland at Wiceła Góra, at which the Cominform was created. He was minister of communications, 1944-46, on Nov. 30, 1946, became minister of national economy and on April 15, 1948, first deputy prime minister and chairman of the State Planning commission. On April 23, 1949, however, he was replaced in the latter capacity by Miron Constantinescu.

GIAUQUE, WILLIAM FRANCIS, American chemist (b. Niagara Falls, Ontario, Canada, May 12, 1895), graduated at the University of California in 1920 and received his doctorate in 1922. He then joined the teaching staff of the university and was instructor, 1922-27, assistant professor, 1927-30, associate professor, 1930-34, and in 1934 was appointed professor of chemistry. Throughout his career he specialized in studies of the properties of matter at the lowest attainable temperatures. For his extensive research in this field the Royal Swedish Academy of Science awarded him the 1949 Nobel prize for chemistry. He received the award in Stockholm on Dec. 10 and two days later delivered his Nobel lecture “Some Consequences of Low Temperature Research in Chemical Thermodynamics.” Other awards presented to Dr. Giauque have included the Pacific division prize of the American Association for the Advancement of Science in 1929 (jointly with H. L. Johnston), the Chandler medal from Columbia university in 1936 and the Elliott Cresson medal from the Franklin institute in 1937. During World War II he was engaged on secret scientific work for the United States government.

History. The United Kingdom government's decision not to create a Legislative Council, announced in July 1948, was rescinded; and the terms were published in August of a new constitution providing for a Legislative Council consisting of the governor as president, three ex-officio, two nominated (of whom both may, and one must, be an official) and five elected members.

In the late summer strong protests were raised against an expenditure of £2,250,000 incurred on the erection of 472 flats under a housing scheme sponsored by the United Kingdom government and which, it was claimed, could have been built far more cheaply with local labour. Linked with these protests were others against an increase on the duty on coffee from Aug. 2 and against a proposed new taxes due to operate from Jan. 1950. A delegation from the Chamber of Commerce visited England to lay the local case before the secretary of state for the colonies.

It was decided to end the wartime evacuation scheme by the end of the year; evacuees from Gibraltar who were still in Britain could apply for repatriation up to that date.

J. A. Hu.

GILBERT AND ELLICE ISLANDS: see PACIFIC ISLANDS, BRITISH.

GIRL GUIDES. New appointments were headed by that of Princess Margaret as Sea Ranger commodore, so extending her connection with the movement to which she has belonged since 1937. Lady Stratheden and Campbell was appointed chief commissioner, Imperial headquarters, in place of Finola Lady Somers, and Viscountess Coville of Culcross succeeded Mrs. Stewart of Murdostoun as chief commissioner for Scotland.

Numbers showed an increase of 5,000 brownies and guides; the total membership in Great Britain stood at 445,000, and the world total at 24 million. The Guide club, for adult members of the movement, was opened at 46 Belgrave square, London, and was honoured by a visit from Queen Elizabeth. For the first time, all members of the movement were asked to contribute a penny a week to headquarters funds in order that headquarters could give the maximum amount of help to its members. The Princess Royal attended a colourful ceremony at St. George's chapel, Windsor, for the dedication of a standard for the chief commissioner for England. The standard, which took 10 years to make, was a magnificent example of embroidery and fine stitchery.

British guides again travelled widely to camps and international conferences and a party from Great Britain attended the Swedish national camp. Great Britain acted as hostess country to the conference for extension guides (those working with handicapped children) which was attended by delegates from 16 countries.

United States. On March 12, the 37th Girl Scout birthday, the “Clothes for Friendship” campaign was concluded. Final figures showed that over 150,000 destitute children in Europe and Asia had benefited by this effort. U.S. Girl Scouts were hostesses at a western hemisphere encampment in Manistee National forest near Muskegon, Michigan.

The Girl Scouts held their 13th national convention in Milwaukee, Wisconsin, Nov. 15-18. A new international service project, called “Schoolmates Overseas,” was announced. Every Girl Scout troop would be expected to make and fill at least one schoolbag for needy children of other lands.

On June 30 there were 446,163 Brownie scouts; 611,622
GLASS—GOLD

intermediates; 54,348 seniors; 323,331 adult volunteers; and 1,065 local professional workers. (C. M. R.)

GLASSES: see ENDOCRINOLOGY.

GLASS. The British glass industry well maintained production during 1949. Supplies of raw materials and fuel were easier but coal was far below prewar quality. Sales of domestic and illuminating glassware increased by more than 7%, above 1948. The production of glass containers exceeded the previous high level; the weekly average output fluctuated between 365,000 and 415,000 gross, the all-time high record of 415,000 gross per week being reached during January. Workers employed in the British glass industry continued to increase in number, the official Ministry of Labour figures being 67,000 in April 1949 (53,100 in 1939). The value of exports reached approximately £10 million compared with £8 4 million (1948) and £6 5 million (1947). More than half of this total was contributed by the plate and sheet glass section whose exports were about seven times those of 1938.

Among new developments were the production of glass beads and small glass spheres—known as ballotini—used for cinema screens, road transport signs, and medical purposes; and a auxiliary electric melting, on the French pattern, was introduced in two glassworks, for bottle glass and borosilicate glass respectively.

European countries generally experienced a decline in the demand for glass products, especially flat glass, which was surprising, considering the vigour with which rebuilding was taking place, particularly in France and Italy. The largest flat glass factory in Italy, almost razed to the ground by bombing during World War II, was practically rebuilt during 1949 and the latest type of machinery for continuous plate glass production installed. About 36,000 workers were employed in the 360 glass factories of Italy. In France and Scandinavian countries additional electric melting furnaces were put into operation. Little news of the glass industry in the U.S.S.R. and its satellites reached the west but it was believed that new flat glass furnaces using the Fourcault process were installed and output improved by the use of mechanical labour-saving devices, especially automatic batch chargers. Toughening of flat glass which was commenced in 1948 continued on a large scale.

In Western Germany, expansion of the glass industry greatly alarmed glass manufacturers of Belgium, France, Holland, Italy and Great Britain, who, in an agreed statement, called the attention of their respective governments to the danger of German competition. Australian glass manufacturers extended their operations in Singapore and initiated a similar plant in Java. In South Africa the government ban on imports caused both the well established factories to increase their output and one commenced the enamelled labelling of bottles.

The International Commission for Glass, concerned with scientific co-operation and development of research in all glass-making countries, held a successful series of meetings in Belgium in June 1949. (E. MGH)

United States. The slight recession in manufacturing during the early months of 1949 caused a decline in the production of all kinds of glassware. Later in the year, however, demand increased. Flat glass, made in 34 establishments, was produced in large volume. The automobile industry required unprecedented amounts of plate glass. The production of glass containers fell off 10% from the previous year, reaching a total of 90 million gross. These were made in 87 factories, employing about 45,000 people and using 4 million tons of raw materials. The total value of all glass products was somewhat less than in 1948 but it exceeded $600 million. Improvements were made in methods of drawing sheet glass, of drawing tubing and in feeding glass to automatic machines. Ribbons of glass a few thousandths of an inch in thickness were successfully produced to serve as dielectric layers in small condensers.

Manufacture of television tubes for the first time passed the million mark. Formerly, these were all made from glass containing lead to provide adequate electrical resistance. New lead-free glasses were developed for this purpose, equally non-conducting. The older names for the varieties of optical glass were virtually abandoned in favour of a numbering system. For example, a glass may be designated as 523: 64, which refers to a glass having an index of refraction of 1·523 and a "mu" value or reciprocal of dispersive power of 64. (S. R. S.)

GLIDING. Greatest activity in 1949 as in 1948 was in France where a government subsidy made gliding available to large numbers without charge. More than 60,000 hr. were flown in gliders and more than 200 skilled pilots earned their silver "C" badges. The year's achievements in Great Britain represented about one-third of this activity. Sweden was next in Netherlands, relatively new to gliding, began to rank fourth. For France, Guy Marchand set up a new international single-seat duration record of 40 hr. 51 min. in a Nordan sailplane in March. The British distance record was taken back by Philip Wills from C. J. Wingfield with a flight of 232·6 mi. on May 1 in a Weihe. In the multi-seater class, K. L. Hurst and K. Simpson in a Kranich set up a British record of 138 9 mi. in Germany on May 28; and J. A. Grantham and B. F. Bell also in a Kranich set up a British height record of 10,080 ft. at Cambridge on July 24. The best out and return flight was made by J. W. S. Pringle and J. A. Grantham in a Kranich on Aug. 12, when they covered 77·2 mi. In the special category for non-British subjects, L. Marmol, a Czech, made a local duration record of 33 hr. 5 min. at Dunstable in April. (L. C. S.)

United States. J. Robinson set an international absolute altitude record by reaching 33,500 ft. in his glider on Jan. 1. This altitude flight was the result of direct application of theoretical and practical knowledge of atmospheric waves. The Soaring Society of America held its 16th national soaring contest at Elmira, New York, July 2-10. Twenty-six pilots flew under a new set of rules in which a set task such as goal, goal and return, straight line distance and speed was determined each day for all pilots by the contest board. A total of 3,381 mi. was flown, 19 flights ranged from 100 to 200 mi. and the longest flight was 205 mi. P. B. MacCready, Jr., flying the Orlik, earned the title of national soaring champion for the second consecutive time.

Another high performance sailplane became available to glider pilots during 1949 when the Civil Aeronautics administration approved the all metal single-place Schweizer 1-23 for production. (B. Sk.)

GOLD. World Production. The Russian output of gold was not reported, but was variously estimated at 6 million to 7 million oz. in 1947, increasing from 3 million to 4 million oz. in 1944. While data were otherwise fairly complete, the lack of a definite figure for an output of this size made the totals subject to a certain degree of uncertainty. The countries listed in the following table account for 70% to 80% of the total output.

Canada. The recovery of gold production in Canada from the postwar slump was not interrupted. Output advanced from 2,696,727 oz. in 1945 to 3,070,221 oz. in 1947, 3,525,221 oz. in 1948 and 2,648,171 oz. in the first eight months of 1949.

South Africa. After a decline of 6% the chief gold-producing country of the world recovered from 11,200,281 oz. in 1947 to 11,584,849 oz. in 1948 and 7,777,747 oz. in the first eight months of 1949.
GOLD COAST: see British West Africa.

GOLF. After World War II the Walker and Ryder cup matches were resumed and were now played in the same year. In 1949 both proved disastrous for Great Britain—so much so, indeed, as to lead to discussion about whether it was worth while continuing them. Each had been won by the British in Great Britain, although not since World War II, but the form of 1949 led to the belief that the gap between the golfers of Great Britain and the United States was, if anything, widening.

At Winged Foot, New York, the American amateurs beat the British, captained by P. B. Lucas, by ten matches to two. At the United States championship later none of the British team performed with distinction. In Great Britain American professionals, led by Ben Hogan, victim of a tragic motor accident in February, lost the foursomes at Ganton, Yorkshire, by 3—1 but rallied in tremendous style to win the match by 7—5. On both sides the golf was of as high a standard as had been seen in this match. England won the men’s international series and also beat France.

The open championship was won at Sandwich by the South African, Bobby Locke (q.v.)—his first “open” success. He had first tied with Harry Bradshaw of Ireland, at 283, equalling the record aggregate first set by Gene Sarazen on the adjacent links of Prince’s in 1933. His play in the replay, which he won with 135 to 147, was the outstanding exhibition of 1949. It was held by some that Bradshaw lost the championship when his ball lodged in the broken half of a discarded beer bottle and he wasted a stroke in getting it out. Such a contingency was later provided for in the new rules passed at the business meeting of the Royal and Ancient in September, to take effect on Jan. 1, 1950. H. Bradshaw later won the Irish Open, beating Locke in the process. The Irish open amateur title was won by Dr. W. O’Sullivan on his home course at the Killarney Golf and Fishing club.

The amateur championship, the decision to play which in the republic of Ireland gave rise to criticism, was won at Portmarnock, magnificently and at the first time of entry, by S. McCready, of Belfast, who entered from Sunningdale. He beat the holder, Frank Stranahan (U.S.), and in the final another past holder from America, Willie Turnesa. In the first round of the final McCready holed the course in 70 to be 4 up. One down with 4 to play he won the next three holes for the match.

Despite this the outstanding amateur golfer of the year was R. White, of Southport, who won the English championship (beating Charles Stowe in the final at Formby), the Daily Telegraph foursomes (in partnership with Reginald Horne at Moortown) and both his matches in the Walker cup. Staleness prevented his showing his best form in the United States championship in which critics on both sides rated his chances high. The Brabazon trophy at Stoneham was won remarkably by P. Hine, a 17-year-old boy, with 287.

The women’s title went to Miss Buntly Stephens at Harlech, where two of the strongest American women players failed. She beat Mrs. V. Reddan, Ireland, in the final. Later Miss Stephens made unsuccessful bids for the American amateur and open titles. Mrs. A. C. Critchley (Diana Fishwick)

![Bobby Locke, winner of the 1949 open golf championship at Sandwich, Kent, and second in the Irish open.](image-url)
was lured from semi-retirement to win the English women's title at Burnham and Berrow.

Among the professionals M. Faulkner won three tournaments, R. Burton two and T. Haliburton, S. King and F. Daly one each. D. Rees, after a dull period, won the match play championship by one hole after a thrilling final at Walton Heath with H. Cotton, who had in turn defeated two United States Ryder cup men, L. Mangrum and J. Palmer, on the same day. The outstanding professional was undoubtedly Charles Ward, who happened also to be the smallest. He won the Masters tournament and two others and for the second year running headed the averages, thus winning the Vardon Trophy.

(H. L.)

United States. Sam Snead, Virginia-born professional, won the national Professional Golfers' association championship, the western open tournament and the masters' invitation tournament. His only defection was in the United States Golf association open tournament, where he made a poor selection of club at the edge of the 71st green. Fifteen-year-old Marlene Bauer easily won the girls' national and western junior tournaments, scored a number of major match victories over her elders and reached the national women's semi-finals in Philadelphia, where two styms by Dot Kiely prevented her from reaching the title match. Winners of the national open and women's titles, respectively, were Cary Middlecoff, a dentist from Memphis, Tennessee, who had turned professional in 1947 after a promising amateur career, and Mrs. Dorothy G. Porter, Philadelphia housewife and mother.

The national amateur champion for 1949 was Charles Coe of Ardmore, Oklahoma, who bore out earlier predictions about his prowess by decisively beating Rufus King of Texas in the final bout at Rochester, New York.

The Western Golf association continued its Evans Caddie Scholars' foundation, a plan designed to give college education to deserving caddies. Fifty-eight boys who were beneficiaries of the foundation were attending 19 colleges and universities throughout the country during 1949. Bing Crosby, one of the directors of the W.G.A., was voted recipient of the W. D. Richardson trophy by the Golf Writers' Association of America for the year's outstanding contribution to golf. The Women's Western Golf association also continued to

be a prominent factor in United States golf. Louise Suggest won the W.W.G.A. open championship, and Helen Sigel of Philadelphia became the first easterner to win the association's amateur title.

Outstanding absentee of the 1949 season, but very much in the minds of golf fans throughout the world, was Ben Hogan, the Texan who preceded Snead as Professional Golfer of the Year. Almost fatally injured in a motor accident in February, Hogan came back as non-playing captain of the U.S. Ryder cup team on its tour of England.

(G. Br.)

GONZÁLEZ VIDELA, GABRIEL, Chilean statesman (b. La Serena, Chile, Nov. 23, 1896), was elected president of Chile in 1946 and assumed office on Nov. 3, 1946. (See also Britannica Book of the Year 1949.)

On Jan. 26, 1949, it was announced that the emergency powers granted to his government in Jan. 1948 had been renounced. An announcement issued at the time stated that his government had "full confidence that Chilean democratic forces have erected an unbreachable dyke against any disruptive attempt by international Communism in our country." A general election on March 6 for a new Chamber of Deputies and 20 new senators gave his coalition government majorities in both houses. At a ceremony in Santiago on Feb. 11, Manuel Bianchi, Chilean ambassador in London, presented González Videla with a portrait of Admiral Lord Cochrane as a boy, a gift from the Anglo-Chilean society.

GOTTWALD, KLEMENT, Czech politician (b. Dědice, Moravia, Nov. 23, 1896), prime minister from July 2, 1946, and president of the republic from June 14, 1948. (For his early career see Britannica Book of the Year, 1949.)

In a broadcast to the nation on Nov. 2 he said that it was "clear as the sun" that without the protection of the U.S.S.R. the Communist party could not have seized power in Czechoslovakia. He alleged that Czechoslovakia owed its creation as independent state to Russia, not to western powers. He also declared that events proved the Czechoslovak government's wisdom in rejecting Marshall aid and joining the Council of Mutual Economic Assistance formed in Moscow on Jan. 25, 1949.

GOVERNMENT DEPARTMENTS. The following were the chief officers of the more important public departments of the United Kingdom, Dec. 31, 1949.

**GRAIN CROPS.** The wide-spread and long enduring drought of 1949 was one of the most potent factors determining the year's production figures of cereals. Although wheat and rye were not much affected the dry weather seemed to have been responsible for somewhat reduced yields of oats, barley, maize and rice. As a major crop, rye was confined to northern and central Europe and here the yields appeared to have been rather less than in 1948 and lower than in prewar times. The Canadian ryegrass which achieved a record figure in 1948 reached less than half this figure in 1949. Oats and barley failed in general to reach the 1948 figures and fell some way below the prewar totals. The acreages of maize and rice in southern Europe continued to expand, especially in France, Greece, Hungary and Portugal. The rice crop of Hindustan and Pakistan remained about its prewar figure. Maize continued its advance northward in Canada.

The most intensive breeding work with rye was done in Sweden. New varieties with twice the chromosome number of normal rye were developed; these were of interest on account of their much larger kernels. Sweden was also the country most actively concerned in the production of new barley varieties. Work continued on the production of new barley strains by means of X-ray induced mutations; and crosses between varieties of very different type were made in the hope of obtaining significant improvements in what was already a highly bred crop. Frost damage was still a limiting factor in barley growing in Sweden and Canada and in both countries efforts were made to secure hardier strains. Some barleys with reduced liability to breakage in the ear or stem, which should prove useful for combine harvesting, were developed in Sweden and renewed interest in naked barley as a possible source of barley flour or green fodder also led to some selection work.

One of the most serious problems confronting the oat growers was the fungus disease *Helminthosporium victoriae*. This disease arose in the United States in the early 1940s and later spread to Canada. It attacked the oat variety Victoria, specially bred for resistance to crown rust, and also various daughter varieties of the Victoria oat which derive their crown rust resistance from it. New sources of resistance to crown rust that were not susceptible to *H. victoriae* were incorporated into the Canadian oat breeding programme.

The continued expansion of the world maize crop remained one of the most significant changes in 20th century agriculture.
GREAT BRITAIN

Much research on the production of new locally adapted maize types was done during 1949 in Canada, central and southern Africa, England, Italy and Portugal. While hybrid maize was the objective aimed at in many cases, there was a growing realization that the expense of producing hybrid maize was considerable and possibly in some cases prohibitive. Consequently, a number of countries decided to see what could be done by mass selection methods which, though unlikely to produce a maize crop yielding as heavily as hybrid maize, would at least give a crop yielding much more than unselected local varieties and at the same time involve only a comparatively slight expenditure in time or money.

Rice was another crop whose acreage in Europe and Africa was increasing. Selection work to improve local varieties was carried out in Italy and Portugal, also in central Africa and in Queensland, Australia. In India, where innumerable varieties already existed, special attention was paid to the development of rice varieties able to tolerate flooding or saline conditions. (R. H. Ri.)

**United States.** The U.S. barley crop of 1949 was estimated at 238,104,000 bu. (British bushel = 1 032 U.S. bushels), the smallest crop since 1937. The crop of 1948 was 315,894,000 bu. and the ten-year average 304,741,000 bu. The total harvested acreage of 9,879,000 was 18% less than in 1948 and 22% less than the average, the major reduction being in the important producing states of North Dakota (26,608,000 bu.), Minnesota (25,464,000 bu.) and South Dakota (14,958,000 bu.). California, as usual, led in production with 47,038,000 bu. The average yield of 24-1 bu. per ac. was less than the 26-4 bu. of 1948 but approximately average for the decade.

The 1949 U.S. corn crop of 3,377,790,000 bu. was the second largest on record, 8% below the 3,681,793,000 bu. of 1948, but 21% above average. The large 1949 crop added to the record carry-over of 815 million bu. provided a total supply about 400 million bu. larger than the 1948 record. Acreage harvested was 86,735,000 compared with 86,067,000 in 1948 and 88,617,000 average for the decade 1938-47. Average yields per ac. declined to 38-9 bu. against 42-8 bu. in 1948, but only 31-4 bu. average for 1938-47.

The U.S. oat crop in 1949 of 1,322,924,000 bu. was 11% less than the 1948 crop but 7% above the ten-year average. An early spring favoured seeding of the crop on a slightly larger acreage than in 1948. However, a dry May and June in the main producing area in addition to heat and disease damage reduced the yield 4 5 bu. per ac. below the 1948 record, in spite of widespread use of improved varieties.

The U.S. rice crop of 1949 was the fourth consecutive record crop, reaching 89,141,000 bu., 42% larger than the 1938-47 average of 62,944,000 bu. and 5% larger than the 85,056,000 bu. of 1948. Acreage, compared with a government target of 1 6 million, was at a record level of 1,821,000. The yield of 49 bu. per ac. exceeded the 47-8 per ac. of 1948 and the 46-6 bu. per ac. average for the preceding decade. Louisiana continued as leading producer.

The U.S. rye crop of 1949 amounted to 18,697,000 bu., the smallest crop since 1934. It was only 71% as large as the 26,449,000 bu. produced in 1948 and only 53% of the 1938-47 average production of 35,109,000 bu. Much of the decrease was accounted for by a cut in the acreage harvested to the lowest level since 1873, 1,558,000 ac. as compared with 2,096,000 ac. in 1948 and an average for 1938-47 of 2,874,000 ac. Only 47% of the acreage sown was harvested, the rest being either used for pasture and cover crop or abandoned. (See also WHEAT.)

**GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.** An independent kingdom in northwestern Europe, the United Kingdom comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and parliament of two houses, the House of Lords consisting of 3 peers of the blood royal, of 704 (Aug. 1949) hereditary peers (21 dukes, 27 marquesses, 133 earls and 523 barons), 26 spiritual peers (2 archbishops and 24 bishops), 16 Scottish representative peers, a number of Irish representative peers (in 1949, 7; vacancies no longer filled) and a few life peers who have held high judicial office; and the House of Commons, numbering 640 members, elected by universal suffrage. The table below shows areas and populations of the component parts of the United Kingdom:

*Wales pop. (1948 est.) 2,523,000.*

Cap.: London (q.v.) (pop., est. June 30, 1949); city and metropolitan police districts 8,390,941; city and metropolitan boroughs only 3,389,850. Chief towns (est. June 30, 1949, if not otherwise stated): Glasgow (est. Dec. 31, 1947) 1,106,000; Birmingham 1,107,200; Liverpool 802,000; Manchester 700,700; Sheffield 513,800; Leeds 505,400; Edinburgh (est. Dec. 31, 1947) 487,300; Belfast (Jan. 1, 1939) 443,500, Bristol 439,840; Nottingham 301,240; Hull 296,600. Newcastle-on-Tyne 295,240, Leicester 283,400. Language: English is almost universally spoken, but in Wales (according to the 1931 census) 3% of the population spoke Welsh only and 31% spoke both languages; in Scotland 0-15% spoke Gaelic only and 2-7% spoke both languages; in the Isle of Man 528 spoke English and Manx. Religions: Church of England (nominal membership 15 million, effective 5-5 million); Roman Catholic Church (England, Wales, Scotland and Northern Ireland, c. 3-5 million); Presbyterian established church in Scotland (1 6 million in 1949); Church in Wales (est. 250,000); Methodists 1-5 million in 1949); Jews (c. 400,000); see also CHURCH MEMBERSHIP. King, George VI (q.v.); prime minister and first lord of the treasury, Clement R Attlee (q.v.); secretary of state for foreign affairs, Ernest Bevin (q.v.).

**History. The Home Front.** To the great majority of the people of Great Britain 1949 presented a picture of calm and the anxieties in their newspapers came no closer than the excitements of the news-reel. The number of people at work was extremely high; unemployment was so low as to blunt the desire to look for new jobs. It was only towards the end of the year that signs of unemployment in the shipbuilding and repairing trades warned the wider public that good times might not last for ever. The hours of work done per person per week differed hardly at all from the average in 1938; and with a huge labour force this made the output very high. The good-humoured calm that enveloped the working population was reflected in labour relations. There were a number of strikes, some of them irritating; but the total number of days lost in consequence was small; and the causes which set off the strikes lay in over-easy circumstances rather than in the presence of manifest wrongs to be righted. This applied, for example, to the so-called lodging turn strikes which occurred among a few railwaymen in June because footplate crews refused to spend the night away from their
homes. More serious were the dock strikes which ran along the coast from Liverpool to London and lasted intermittently from April until July. The go-slow movement at Smithfield was due to the porters’ desire to prove that what seemed to be the modest amount of work they did in a week was in fact a full week’s work.

Some of these movements—particularly that among the dockers—were fomented by Communists. But their success was too slight to trouble the generally tranquil picture of the country as a whole. There had been warnings. In March the Trade Union congress condemned the disruptive tactics of the Communists, and in April the prime minister gave a general warning against Communism. Early in January Arthur Deakin, secretary of the Transport and General Workers’ union, had claimed to have knowledge of Communist plans to disrupt industry in August; but August turned out to be a quiet month. And the general good temper was further illustrated by the action of the railwaymen as a body. Rather unskilfully led, the railwaymen put forward wage claims which British Railways would have been financially unable to meet. The claims were rejected by the Conciliation board. An attempt was then upon made to get a “work to rule” (i.e., a slow motion) movement under way; but it met with a heavy defeat.

For a large proportion of the population conditions of life were in fact fairly comfortable. Some scarcities diminished. Early in the year clothes rationing was ended to the accompaniment of a subsidiary “bonfire,” as the president of the Board of Trade called it, of minor controls. The running of the important remaining controls grew smoother as experience suggested the adoption of appropriate devices for collaboration between the ministries and industry. The cost of living was virtually unchanged. So were wage rates.

The national quietism went naturally with the national state of good health. Great Britain was euplectic. In the September quarter infant mortality reached the lowest figure ever recorded, and the low rate for most diseases reflected the effects of the approach to economic egalitarianism. But the birthrate remained low; the population was ageing and this fact contributed to the quiet nature of the national temper. The country’s moral health too continued to improve. The level of officially notified crime was higher than before World War II; but as memories of the war faded and as shops became better stocked the urge towards crimes against the person and against property lost force. In the London metropolitan police area a marked and contra-seasonal decrease of crime was reported in the second half of the year.

Political life developed on normal lines. Parliamentary by-elections showed the pendulum swinging slowly towards the Right but the opposition gained no seats. Some analysts observed especially that Liberal voters were sharing in the movement to the Right. This movement was manifest also in the local government elections held in April. As a general election was due at the latest in 1950 special attention was paid to the drafting of party programmes. The Labour party led the way, publishing in April a policy statement which was adopted by the party conference in June. In theory uncompromising, this document made some allowance for realities in practice. Nationalization was proposed for industrial assurance, the cement industry, sugar refining and manufacturing, the wholesale meat trade and slaughterhouses, cold storage, water supply and all suitable minerals. The chemical industry was to be examined and a development centre was to be set up for shipbuilding and repairing. Industries already nationalized were to be gradually decentralized and the “fruitful partnership” between private and public industry was to be extended. Some controls were to stay, others to be removed.

Conservative policy was stated in July in a booklet called The Right Road for Britain. The nationalized industries were to be decentralized but there was no mention of wholesale denationalization. Some important controls were to stay as long as they were necessary. Direct taxation was to be reduced; there were to be insurance and pension reliefs, and the social services were to be maintained, but waste was to be cut out. Attlee and other critics believed the reliefs were incompatible with lower taxation.
As the year went on the government came to be more on the defensive. At the Trades Union congress conference at Bridlington in September Attlee stressed the need for higher production and urged that an increase in wages for the lowest-paid workers should not involve consequential increases all along the line. On this point the unions did not see eye to eye with the government.

The Conservative party conference was held in London in October under the shadow of the evaluation crisis. It brought promises of support for any necessary sacrifices but did not produce a detailed programme for meeting the emergency. Winston Churchill, the leader of the opposition, eloquently refrained from saying that a Conservative government would scrap all Labour measures. The debate on the government's economy measures in connection with the dollar crisis showed that some Conservatives (e.g., Anthony Eden) were ready for more drastic measures than those outlined in The Right Road for Britain.

By the end of 1949 the government had completed its major programme of legislation. It main objective now was the passing of the Iron and Steel bill and of the Parliament bill. In November the government agreed to delay the vesting day for the Iron and Steel industry until after the general election; and thus the bill reached the statute book without the application of a new Parliament act.

Economics and Finance. The almost idyllic conditions of the domestic scene were spoilt by the fact that the entire structure was built on sand: the entire economic field was dominated by the issue between national solvency and insolvency. Supplementary estimates published in February showed that an additional £58 million would be needed for the National Health service and a further £52 million for the Ministry of Food. The financial year ended on March 31 with a true surplus estimated at £352 million and the new budget provided for one of no more than £14 million. It represented a success for the forces of solvency; for the chancellor kept the subsidies (designed to keep the cost of living at a moderate level) at £463 million, or £103 million less than the rates ruling in the previous financial year would have cost.

Nevertheless, it presently appeared that the state was spending more than it was receiving. Expenditure soon rose to a rate suggesting that long before the end of the financial year the estimates would be exceeded; there was no similar indication for revenue. The public too was in no saving mood. Savings were drawn on at a net rate of nearly £2 million a week, and the turnover of money (as measured, for example, by the figures of the provincial clearings) became more rapid.

Questions of internal solvency were overshadowed (despite the continued receipt of E.R.P. aid) by those relating to the balance of trade. In the second half of 1948 the country's overseas accounts showed a small surplus. In the second half of 1949 this trend was reversed and clouds rapidly rose above the horizon. The trouble was that, though the overall accounts balanced on paper, Great Britain (and the sterling area as a whole) was unable to balance its accounts with the dollar area. Though it had a surplus with the rest of the world the balances thus built up could not be used to pay for imports from the United States since many of Great Britain's debtors were themselves insolvent, so far as their foreign trade was concerned. British overseas trade policy was caught in a dilemma. If it concentrated on arranging two-sided trade treaties (as with Poland and the Argentine) it did nothing to foster the growth of world trade, without which British commerce cannot flourish; if it worked towards increasing the volume of world trade (as at the Brussels conference on the convertibility of currencies in June and at the Annecy conference on tariffs which ended in October) it ran the risk of financing the weaker countries' trade at its own expense.
Strasbourg in August and September. It surprised many by providing evidence of solidarity: it kindled the imagination of the fairly large body of British public opinion which saw in the attempt to introduce a measure of unity into western Europe something more than a defensive instrument.

Like the American administration the British government was ready to take energetic action on its side of the "iron curtain" to restrain whatever ambitions might animate Soviet policy. But the government was unable to devise effective action beyond the curtain. For example, both Great Britain and the United States addressed protests early in April to Bulgaria, Hungary, and Rumania on the score of their alleged violations of the peace treaties; but it was clear that this action was prompted rather by the wish to keep the diplomatic record straight than by the hope of weakening the Communist front. A similar inability to work out an effective policy was shown later in the year when Marshal Tito's breach with the U.S.S.R. became more and more violent. The impulse to assist him was evidently tempered by the desire to take no irremediable step about the Soviet Union.

As for Germany, policy was hampered by the fact that, if weak, the federal republic must be a drain on its victor-sponsors and a possible breeding-ground for Communism; but, if strong, it would sooner or later pursue an independent policy, and one not necessarily accommodated to the interests of the western powers by any pre-established harmony. The programme for setting up a Western German government was pushed ahead. The British government played a proper part in fostering its creation. At the same time it was accused of showing itself unable to grasp the implications of this policy. The dismantling of German factories listed as potentially dangerous continued through most of the year to the accomplishment of vocal protests and sometimes of physical violence on the part of the Germans. Towards the end of the year it became obvious that dismantling would be a major issue for the West German opposition and could not be disregarded by the administration. Probably the British government was not prompted solely by fear of the new Germany it was helping to build up; it would not wish to present the Soviet government with a cut and dried case for contending that the former enemy was being treated as a friend.

On the Soviet Union's eastern flank British policy was ambiguous. The Chinese Communists overran most of the country, and it was obvious that theirs was the dominant power. In view of this fact, and of the desirability of maintaining commercial relations, the government appeared anxious to recognize the Communists. Public opinion, seizing on the striking and the essential, concentrated its attention on relations with the U.S.S.R. and extended to every manifestation of Communism its hostility to that power. There was a strong craving for reassurance about the status of Great Britain. This showed itself in the indignation aroused by the Communist shelling of the frigate "Amethyst" on the Yangtse in April, and in the effervescence of celebrations occasioned by the vessel's escape in July.

Commonwealth Affairs. Intra-Commonwealth relations showed that evolutionary quality which is necessary for the healthy life of any political body. With respect to India, for example, means were found for expressing the dominion's continued membership of the Commonwealth as well as its changed relationship to the traditional bond of empire, the crown. After exploratory conversations between British envoys and the respective dominion authorities, a Commonwealth conference was held in London from April 21 to 27. A formula was found declaring that India accepted the King as the symbol of the free association of the Commonwealth's independent member nations but also affirming that India was to become a sovereign independent republic. This recognition of apparently conflicting principles was approved by the other dominions.

An analogous reconciliation was effected by the Ireland bill, which was published on May 5 and declared that the republic of Ireland ceased to be part of His Majesty's dominions on April 18 but would not be a foreign country for the purposes of any law in force in the United Kingdom or the colonies. The bill also affirmed that Northern Ireland remained part of the British dominions. The measure had a bad reception in the republic of Ireland as perpetuating the so-called partition. But it correctly stated the facts of the situation.

In the colonial empire stress was placed on economic development. In the Commons debate on July 29 Creech Jones, the colonial secretary, showed that he understood the need to build up a higher standard of living. The difficulty lay in the shortage of capital in Great Britain; and a report issued on July 29 by the Parliamentary and Scientific committee suggested co-operation with the United States in dealing with the under-developed areas. The hazards of colonial development were illustrated by the history of the government's groundnuts scheme. Early in November it was estimated that over £29 million had been spent on this undertaking. It was clear that, whatever its ultimate fate might be, the project was a long-term pioneering endeavour and exposed to all the difficulties inherent in this kind of effort.

As the year advanced the financial difficulties of Great Britain and of the sterling area received growing attention. A conference of Commonwealth finance ministers sat in London from July 13 to 18. It expressed its appreciation of the need for a single many-sided system of world trade and payments and it discussed means for expanding the sterling area's earnings of dollars. The rate of the outflow of gold and dollars did in fact decline during the third quarter of the year. Equally important, within the sterling area, were the war debts owed by Great Britain to some of the dominions. In August arrangements were concluded with India and Pakistan (Cmd. 7760 and 7765, H.M.S.O., London) governing releases of sterling to these creditors. If measured against the sums owed the releases were moderate; if against the British straits, large. They were criticized on both grounds (see also British Empire). (W. L. A.)

Education. The Education acts for England and Wales (1944), for Scotland (1945) and for Northern Ireland (1947) had the effect of causing certain postwar information to be summarized in forms not always comparable with prewar statistics. Totals, however, might be compared and in Table I figures are given for 1938 and 1948.

Sales of milk in the United Kingdom amounted to 1,249 million gal. in 1938, 1,378 in 1944, 1,618 in 1948 and 1,737 in 1949.

It was estimated that agricultural production in 1949 was about 30% above prewar. About 40% of Britain's food was home produced, compared with about 30% prewar. At the end of the year meat, bacon, fats, milk, cheese, eggs, sugar and tea continued to be rationed. An account of the payments made on the food subsidy was given by the chancellor of the exchequer on Nov. 3. He listed the annual rate of payments as follows (£ million):

| * Including private indoor domestic servants and gainfully occupied persons over pensionable age (men 65, women 60).
The total number of wage-earners in the coal-mining industry decreased from 782,000 in 1938 to 698,000 in 1941 and was 724,000 in 1949. The overall absence of production which stood in 1938 at 6.4% reached 16.3% in 1945, decreased to 11.6%, in 1948—all percentages being weekly averages. The average output in tons per man-shift worked was 1.14 in 1938, 1.00 in 1945 and 1.11 in 1946.

The indigenous petroleum production, which was 125,500 long tons in 1938 reached 257,300 tons in 1943 and decreased to 153,100 tons in 1948. This covered a very small percentage of national consumption. In 1948 total production from petroleum refineries and distillation plants in Great Britain attained 3,383,600 tons of liquid products, including 1,753,200 tons of fuel oil and 617,100 of motor spirit. In addition, in the same year, a total of 3,497 million gallons of refined petroleum were imported, including 3,063 million gallons of fuel and Diesel oil and 323 million gallons of motor and other spirits.

Finance and Banking. Table XV gives the United Kingdom's postwar budget figures with the last prewar budget as a measure of comparison. The fiscal year ends on March 31.
GREECE. A kingdom in the southern part of the Balkan peninsula. Area: 51,168 sq. mi. including the Dodecanese Islands (1,035 sq. mi.); the mainland accounts for 41,328 sq. mi. and the islands, the largest being Crete (3,235 sq. mi.), for 9,854. Greece covers an area slightly larger than that of England, but only one-fifth of the Greek land is cultivable, the rest being barren mountains or swamps. Pop.: (1928 census) 6,204,684 including 1,221,849 transferred from other countries, but mainly from Turkey (1,014,216); (Oct. 16, 1940 census) 7,344,860; (Dec. 31, 1949 est.) 7,960,000.

Chief towns (1940 census, municipal area only): Athens (q.v.) (cap., 481,225); Piraeus (205,404); Salonika or Thessaloniki (226,147); Patras (79,570); Volo (54,919).

Languages (1940 census): Greek 6,794,308 (93%); Turkish (Turks and Turkish-speaking Greeks from Anatolia) 222,968; Macedonian Slav 81,860; Rumanian (Koutso-Vlachs) 57,263; Albanian 49,629; Bulgarian (Pomaks) 18,086, etc. (Religions 1940 census): Greek Orthodox 7,090,192 (96.5%); Roman Catholic 29,136; Moslem 134,722; Jewish 53,094 (reduced to 9,000 by German executions). Ruler, King Paul I (q.v.); prime ministers in 1949, Themistocles Sophoulis (see OBITUARIES) and (from July 1) Alexandros Diomidis (q.v.); deputy prime minister and minister of foreign affairs, Konstantinos Tsaldaris (q.v.).

History. The early months of 1949 were marked by a deterioration of security in Greece, with the Communist rebels reaching the climax of their military effort. On Jan. 11, rebel forces captured the industrial town of Naoussa, in Macedonia, and held it for three days before being ejected by government troops. Many of the factories and other buildings of the town were destroyed by the retreating rebels, who also executed the mayor and many prominent citizens. This raid was followed on Jan. 20 by an attack on Karpenissi, in central Greece, which the rebels occupied for a fortnight before government troops recaptured it.

This proved to be the last success for the rebels. The appointment of General Alexandros Papagos (q.v.), Greece’s wartime leader, as supreme commander of the Greek armed forces and the drastic changes which the new commander in chief enforced in army commands and military tactics resulted in the methodical liquidation of the rebel forces beginning with the Peloponese, which was cleared by the end of March, and culminating in the large-scale offensives of August-September in the last remaining strongholds of the rebels in the Mount Vitsi and Mount Grammos areas, on the Greco-Albanian frontier. By the middle of October all organized resistance on the part of the rebels had collapsed, and on Oct. 16 the rebel radio announced the “temporary cessation of hostilities.” Casualty figures issued by the Greek general staff showed that, from June 1, 1946, when guerrilla activities began, to March 31, 1949, the Greek army lost 10,927 killed, 23,251 wounded and 7,356 missing; casualties inflicted on the rebels during the same period totalled 70,028 (28,992 killed, 13,105 captured and 27,931 surrendered). Non-combatant casualties were 4,247, of whom 3,516 were executed by the rebels and 731 were killed by rebel-laid mines. Damage to property included many bridges blown up, over 11,000 houses destroyed and nearly 7,000 villages looted. Some 700,000 persons were obliged to abandon their farms and homes in rebel-infested parts of the country and seek refuge in safe areas, and over 28,000 were abducted by the rebels and removed to Communist countries north of Greece.

In the domain of internal politics there were also several developments during 1949. The Liberal-Unionist coalition government of Themistocles Sophoulis, which on Nov. 21, 1948, had obtained a vote of confidence by a majority of only 1, was obliged to resign on Jan. 15 after various attempts to broaden its basis had failed. Following a vigorous statement by the King that, unless a national government were formed at once, he would be obliged to seek “another solution,” Sophoulis succeeded in forming a new government on Jan. 19, comprising not only the two main parties (Populist and Liberal) but also the Unionist party of Panayotis Kanellopoulos and the New party of Spyro Markesinis, with Alexander Diomidis, a non-party elder statesman, as deputy premier. Although this government obtained an overwhelming vote of confidence a fortnight later (245 to 50), it had a brief life; allegations against Markesinis led to its resignation on April 12 and the formation, two days later, of a new government which was identical with its predecessor, with the exception that the New party was excluded. This government remained in office until June 24 when the prime minister, 88-year-old Sophoulis, died. Attempts by K. Tsaldaris, leader of the Populist (majority) party in the Chamber of Deputies, to form a government having failed, the King entrusted Diomidis with the formation of a new government, which was sworn in on July 1. The new government was again a Populist-Liberal-Unionist coalition, with Diomidis as prime minister and the leaders of the Populist and Liberal parties, Tsaldaris and Sophocles Venizelos, as deputy prime ministers.

The Greek question again came up for discussion before the 4th general assembly of the United Nations in September-December. The U.N. Special Committee on the Balkans (U.N.S.C.O.B.) presented its report, covering the period Oct. 1948-July 1949, in which it was stated that continued Albanian and Bulgarian aid to the Greek rebels had made the situation a threat to the political independence and territorial integrity of Greece and to peace in the Balkans, and that both these countries had allowed the rebels “extensive use of their territories and had actively campaigned for guerrilla recruitment. The report added that Yugoslav aid had decreased and “may have ceased.” (In a speech at Pola on July 10, Marshal Tito announced that the Yugoslav front with Greece would be closed.)

After a lengthy and acrimonious discussion, the general assembly adopted on Nov. 18, by 50 votes to 6 with 2 abstentions, a resolution naming Albania, Bulgaria and Rumania

King Paul and Queen Frederika greet prizewinners at a sports meeting in Athens, July 1949.
in five yearly instalments by supplying agricultural and industrial products for which Greece would provide the raw materials.

In addition to her prime minister, Greece also lost two of her leading prelates during 1949. On May 20 the archbishop of Athens and primate of all Greece, Mgr. Damaskinos (see OBITUARIES) died of heart failure. The metropolitan of Jannina, Mgr. Spyridon, was elected on June 4 to succeed him. On Sept. 28 Archbishop Chrysanthos, whom Mgr. Damaskinos succeeded as archbishop of Athens in June 1941, also died of heart failure. (See also EASTERN ORTHODOX CHURCHES; ZAHARIADIS, NIKOLAOS.) (A. A. P.)

Education. (1947-48) Primary and infant schools 9,082, pupils 1,023,356, teachers 16,354; secondary schools 407, pupils 92,687, teachers 3,735; universities 2, students 7,330, professors and lecturers 254. Illiteracy (1940) 38%.

Agriculture and Fisheries. Main crops (in '000 metric tons, 1948; 1949 estimates in brackets): wheat 770 (650); barley 190; oats 110; rye 40 (30); potatoes 304; rice 9; maize 229; legumes (dry edible) 68; tobacco 37; cotton 36; must 390; table grapes 105; currants 78; sultana raisins 22; dry figs 23. Livestock (spring 1948, in '000 head): sheep 7,000; horses 240; donkeys 360; mules 148; bulls 700; buffaloes 59; goats 3,600; pigs 485; poultry 8,312. Sea fisheries: total catch (1948) 104,000 tons.

Industry. Persons employed in industry (Oct. 1948) 122,500. Raw materials (in metric tons, 1948): iron pyrites 14,805; baryta 18,706; bauxite 44,238; magnesite 11,610; emery 12,000; chrome ore 1,500; sulphur 1,234; zinc 5,712; niter 1,166; lead in sheets 254; caustic calcined magnesia 238; lignite 150,000.

Finance. (Million drachmae) Budget: (1948-49 revised estimates) revenue 3,486,000, expenditure 4,319,000. Foreign aid to Greece since the liberation to Jan. 1949: U.N.R.R.A., $347.2 million; Import and Export bank $38 million; United Kingdom £60 million; United States $465 million. Currency circulation (million drachmae, July 1949; in brackets, July 1948): 1,292,000 (1,046,000). Monetary unit: drachma with an exchange rate (from Sept. 20; in brackets previous rate) of 42,000 (32,000) drachmas to the pound and 15,000 (10,000) to the dollar.

GREENLAND. A large island (839,782 sq. mi., about 705,000 sq. mi. covered by an ice cap) and a Danish possession in the north Atlantic ocean northwest of Iceland. Capital: Godthaab (second governor's seat, Godhavn). Pop. (Oct. 1, 1945 census): 21,384 distributed in small settlements along the west and south coasts, except for 1,371 on the east coast; 569 were Europeans (mostly Danes), the rest native Greenlanders (Esikmos). Language: Danish and Eskimo. Religion: Lutheran (Church of Denmark). Governors in 1949, C. F. Simony and N.O. Christensen.

History. At the centenary of the Danish constitution, June 5, a representative of Greenland was among those who addressed a joint meeting of the two houses of parliament in Copenhagen. During 1949 the Greenland commission deliberated the proposed administrative and economic changes in the existing regime through various sub-committees, and visited Greenland in the summer. Extended access to the country, but in controlled forms, was expected to result. Meanwhile tourists were increasingly encouraged; the administration's guest-houses in Godthaab and Egedesminde could each accommodate 30 visitors.

Before the Danish foreign minister signed the North Atlantic treaty he was assured in Washington that U.S.
bases in Greenland would neither be enlarged nor increased in number, and that in future such questions would be reviewed by all the signatory powers in consultation.

The Danish government voted Kr. 850,000 for the detailed examination of the E. Greenland lead deposits discovered by Dr. Lauge Koch, who revisited the area with about 80 assistants, 30 remaining there for the winter. Several radar-active slate beds were found. Over 20 meteorological stations, reconstructed on the broader basis established by the U.S. in wartime, were by 1949 manned by 90 Danes and 40 Greenlanders; over 30 Greenland telegraphists had already graduated from the local training school. During the summer a group of scientists, technicians and workers were to start building a slaughter-house, canning factory and freezing plant.

In July 1949 a French expedition of 20 men with 5 snow vehicles reached the site of the central Greenland station occupied in 1930-31 by Alfred Wegener’s ill-fated expedition.

Education. (1948) Centres for instruction 175, pupils 4,200, teachers 237; post-primary schools 4, pupils 100, teachers 15; technical school 1, pupils 50, teachers 2; institutions of higher education 2, students 45, lecturers 10. A few old persons still illiterate.

Agriculture and Fisheries. Livestock (Nov. 1, 1947) cattle 90,000, horses 31,377, pigs 14,394, poultry 1,596. Total catch of fish (1948) 20,000 tons, worth c. Kr. 14 million.

Industry. (1948) Industrial establishments 8, with c. 400 persons employed. Cryolite exported (1947) 40,358 metric tons, coal (1940-45 average) 6,500 metric tons.

Foreign Trade. (1948) Imports Kr. 16,661,000, exports Kr. 12,071,000. Main imports: wooden products, cereals, food of animal origin, textiles, tobacco, coffee and petrol. Main exports: cryolite, salted and dried fish and whale fat.

Transport and Communications. Motor vehicles licensed (Jan. 1949) cars 26, lorries 47. Merchant vessels on Denmark-Greenland run 7 (6,146 tons), in Greenland coastal traffic 14 (1,360 tons). Wireless licences: (April 1, 1948); 700.

(G. J. L.)

GRENADE: see Windward Islands.

GREYHOUND RACING. Taxation of totalizator receipts (10%) at British greyhound racing tracks in 1949 gave an estimated £9 million to the exchequer, despite a 15% decline in tote betting on greyhound caused by a normal recession from the boom years of 1945-6. Breeders in Britain and Ireland returned to prewar discrimination in the use of stock. Promoters made the photo-finish general at the National Greyhound Racing society’s 76 racecourses (there were some 110 independent tracks). Two tracks introduced automatic starting release of the starting box and experiments were made on automatic control of the dummy hare. The year was notable, too, for an increased interest taken by British owners and trainers in the sport in the United States, Hong Kong, Australia. But currency restrictions stopped any considerable export of British- or Irish-bred greyhounds. Ireland once again supplied Britain with greyhounds, valued at £900,000.

The Greyhound Derby (525 yd., White city, London), the year’s chief race, was won by W. J. Reid’s English-bred bitch, Narrogar Ann. Open races, on which private trainers depend almost entirely, were some 300 fewer than in 1948, many of these events having to be cancelled through lack of entries, particularly in the north. The Anglo-Irish International race was run at Shelbourne park, Dublin. The winner was Lone Train, a two-year-old bred and trained in Belfast. Other important winners were: Ballymac Ball (Laurels); Local Interprize (Gold Collar); Blossom of Anna-gurra (Grand National); Eastern Madness (Steward’s cup); Spanish Lad (Irish Derby); Mutton Star (Olympic); Burn-dennett Brook (Scurry cup); Behattan Marquis (Northern flat championship); Flashy Prince (Easter cup). (J. A. R.)

GRUENEWOHL, OTTO, German politician (b. Brunswick, 1894). A printer by trade, he joined the S.P.D. (Sozialdemokratische Partei Deutschlands) after World War I, was a member of the Brunswick Landtag 1920-25, Brunswick minister of the interior and education 1921-22, and of the interior and justice 1923-24. From 1925 to 1933 he was a member of the Reichstag. In 1933 he was arrested and sent to a concentration camp. When in June 1945 the S.P.D. was re-organized he was elected leader of the party in the Soviet zone of Germany and member of the central executive committee. He accepted the idea of a merger between the S.P.D. and the K.P.D. (Kommunistische Partei Deutschlands) which was mooted by the political advisers to the Soviet military administration; and when, in April 1946, the merger took place in the Soviet zone he was elected one of the chairmen of the resultant S.E.D. (Sozialistische Einheitspartei Deutschlands), the other being the Communist leader Wilhelm Pieck (q.v.); he also became one of the nine members of the Politburo of the S.E.D. When the Russians decided to organize a people’s republic in their zone of Germany, Gruenewohle was appointed prime minister of the east German government and on Oct. 12 presented his cabinet to the Volkskammer (lower house). At the end of December it was announced that he had been ill for several weeks and had left to convalesce at a south Soviet spa.

GRUBER, KARL, Austrian statesman (b. Innsbruck, Tirol, May 3, 1909). After reading law at the University of Innsbruck he completed his legal studies in Vienna, taking his degree of doctor of laws in 1936. He had entered government service in 1934, in the postal administration. Beginning in the Youth group of the Social Democratic party he transferred his allegiance, in 1934, and soon became prominent in the Christian Social trade union movement, as well as in Catholic student activities. His opposition both to the Heimwehr and to the Nazis during the period before the Anschluss brought about his dismissal from office in 1938. He then went to Berlin and secured a post with an industrial concern, at the same time organizing with other Austrians a clandestine Austrian resistance movement. During World War II he contrived to keep in touch with his friends in the Tirol and with the Allies and early in 1945 he returned to his native land, becoming head of the executive committee of the Tirolean resistance movement. He was chosen to be provincial governor for the Tirol in June 1945 and was a delegate to the first congress of the provinces in Vienna in September. Dr. Karl Renner gave him the post of under-secretary of foreign affairs in his provisional government and on Dec. 19, 1945, he took office as minister of foreign affairs in the 1 copeland Figi cabinet, being the youngest foreign minister of any European country. On Nov. 25, 1945, and on Oct. 9, 1949, he was elected as a People’s party deputy for the Tirol.

(W. H. CTR.)

GUADELOUPE: see French Union.

GUAM: see United States Territories and possessions.

GUATEMALA. A Central American republic bounded on the W. and N. by Mexico, on the E. by British Honduras, the Caribbean sea, Honduras and El Salvador, and on the S. by the Pacific ocean. Area: 45,452 sq. mi. Pop. (mid-1948 est.), 3,717,000 including almost two-thirds of pure Indians descending from Maya or Queché strains, one-third of mixed Indian and Spanish (lados) and Indian
and Negro blood, the balance of about 1% being white.
Chief towns: Guatemala City (cap., pop. 1946 est., 225,000);
Quezaltenango (pop., 1940 census, 33,538); Puerto Barrios
(pop., 1940 census, 15,784). Language: Spanish, but
unknown to hundreds of thousands of speaking only Indian
dialects (numbering at least 18). Religion: predominantly
Roman Catholic. President, Juan José Arévalo.

History. The continued minority resistance to the leftist
administration of President Arévalo was emphasized in 1949
by two abortive revolts. The first uprising (described by
the government as mere banditry) occurred April 7, when 200
armed men seized five towns near the Mexican border and
sacked the customs offices. Government troops regained
the towns within two days and most of the insurrectionists
were either killed or captured. A more important revolt
(the 20th since Arévalo took office in 1945) began on July 18.
It was apparently set off by the assassination of Colonel
Francisco Javier Arana, chief of the armed forces and
potential successor of Arévalo. The Guardia de Honor
garrison rebelled but was subdued within 24 hours, after
the loss of 50 lives. Labour unions, student organizations
and large numbers of other civilians aligned themselves
with the government during the crisis. The administration
denied rumours that Colonel Arana had been plotting a
coup and implied that he was assassinated by “reactionaries”
for having refused to lead an insurrection. In December a
military court sentenced 14 of the accused insurgents to
from two to ten years imprisonment.

Rainstorms in September and October resulted in great
loss of life and caused property damage amounting to
about $23 million. The government issued $2 million in
bonds to finance emergency rehabilitation and relief.

The slowdown strike of United Fruit company wharf
workers at Puerto Barrios and banana harvesters in Tiquizau
reached a crisis in February when the company suspended
its activities, leaving 10,000 unemployed and paralysing
shipping at the chief Pacific port for several weeks. The
conflict was settled on March 7 through government
mediation, the workers being awarded wage increases and
a collective contract. In September the United Fruit company
announced its abandonment of more than 50,000 ac. of
banana plantations because of poor prospects.

Education. Schools (1946) elementary 4,425, teachers 8,266, pupils
225,362, secondary 45, teachers 819, pupils 5,494. University of San
Carlos, students 1,719. Four other establishments of higher education,
students 773. The 1948-49 budget allocated $6.3 million for public
education.

Foreign Trade. Exports for 1948 amounted to $50 million including
gold and silver, imports were valued at $68 million. More than three-
fourths of the trade was with the United States. Leading exports in
1947 coffee, bananas, cabinet woods, cinchona bark, cattle hides,
essential oils and rice. The exportable crop crop for the 1949-50
season was estimated at 750,000 bags (910,000 in 1948-49).

Communications. Railways (1947) 817.477 mi. Of the 4,800 mi of
highways in 1945, 2,400 were improved. There were about 8,500
automobiles and trucks registered in 1948.

Finance. The monetary unit is the quetzal, maintained at par with
the U.S. dollar. Budget (1949-50 est.) provided for expenditures of
$41.5 million, including $9 million reduction from the final 1948-49 figure.

As at March 31, 1948, the public debt was $847,700, external. $3
million internal (M. L. M.)

1949); Ralph Linton, ed., Most of the World (New York, 1949).

GÜNALTAy—GYNÄCOLOGY AND OBSTETRICS 315

GÜNALTAy, SEMSETTIN, Turkish statesman
(b. Egin, 1883), studied at the University of Lausanne,
where he graduated in natural science. He had been an
active member of the Union and Progress party and after
the 1908 revolution published a series of books of historical
interest, in which he urged a thorough reform of Islam. He
lived many years abroad. On his return to Turkey, he was
appointed in 1915 to the chair of Turkish history and of
the history of the Islamic races at the University of Istanbul. He
was elected deputy for Bilecik to the Ottoman Chamber of
Deputies, and represented his constituency until the abolition
of the chamber. During the Turkish war of independence, he
played an active part in the Istanbul organization of the
Nationalist forces, and in 1925 was elected deputy for Sivas
to the Grand National Assembly in Ankara, assuming at
the same time the professorship of Turkish history at the
universities of Ankara and Istanbul. Appointed vice-
president of the Grand National Assembly in 1938, and vice-
president of the parliamentary group of the Republican
People's party in 1946, he became prime minister on Jan. 16,
1949. Speaking at Izmir on Nov. 7, he said that Turkey formed
a bridge between struggling worlds and must have recourse
to all means for its defence.

GUSTAF V (Oscar-Gustaf-Adolf), King of Sweden
(b. Drottningholm castle, June 16, 1858), succeeded his
father, Oscar II on Dec. 8, 1907. (For his early life see
Encyclopaedia Britannica and Britannica Book of the Year,
1949).

Suffering from bronchitis, King Gustaf was carried to the
Riksdag on a stretcher when he opened the new parliamentary
session on Jan. 11, 1949, but was able to walk to the throne
supported by Crown Prince Gustaf Adolf. In March he
left for France; his health was so much improved by a two
months' stay on the French riviera that on July 10 he enjoyed
a swim in the Kattegatt at Saeroe. In September he again
fell ill but recovered and on Oct. 10 was able to open new
premises of the Supreme Court. In December, however,
he was too weak to attend the Nobel festival and the prizes
were given to the winners by the Crown Prince.

GYMNASTICS. The Olympic Games of 1948 gave a
great impetus to the general interest in gymnastics in Great
Britain; it was most marked in 1949 in the championships
and competitions and in the response to the revised scheme
for the training of coaches.

The national championships were won as follows: men's
individual, F. C. Turner; women's individual, M. Hurst;
women's gym team, Saltaire ladies' club; men's physical
training team, Woodhouse club, Leeds; and women's physical
training team, Saltaire ladies' club. The English champion,
F. C. Turner, represented England at the international
gymnastic tournament held at Ostend, Belgium, in August.

The first inter-branch competition for men's and women's
teams was held during the year. The men's contest was won
by Wales; the northern counties won the women's events.

The second international Linglad opened in Stockholm
on July 27. More than 15,000 gymnasts from 17 countries
took part. The first Linglad was held in Aug. 1939 to celebrate
the 100th anniversary of the death of Per Henrik Ling,
founder of the Swedish system of physical exercises. (L. N.)

GYNÄCOLOGY AND OBSTETRICS. The
twelfth British Congress of Obstetrics and Gynecology
held in London during 1949 was mainly devoted to reviews
of the state of various aspects of these subjects. Sir William
Gilliat described the remarkable decline in maternal mor-
tality during the previous 15 years. In the years under con-
sideration maternal mortality in Great Britain and the U.S.

fell to less than one-fourth of what it had been; analysis of figures under individual causes of death showed that puerperal and post-abortal sepsis, which used to be by far the greatest factor, had dropped to one-sixteenth of what it had been in the early '30s, and toxemias to about one-fourth. However, there was still no major advance of knowledge of the causes and treatment of toxemias. It was agreed, too, that hemorrhage was still a menacing component of the death rate, despite greatly increased facilities for blood transfusion.

Percy Stocks pointed out, in a review of progress illustrated by vital statistics, that the stillbirth and neonatal death rates in Great Britain had fallen by 40% in 20 years and the infant mortality rate by 59%, so that it was now no longer true that the decline in infant mortality round about birth was lagging very much behind the improvement in later infancy. Nevertheless, birth trauma as a cause of death was relatively high and prematurity still a major factor.

The value of vaginal cytological methods for the study of the epithelium of the upper genital tract was well established, although their limitations were also better known. It was now realized that cancer of the genital tract was a disease with a long preclinical and preinvasive course, often detectable by these cytological methods and therefore remediable in its early stages. It was relatively simple to classify the malignant lesion with an accompanying low operative mortality. The confessions of American and British gynecologists that the technique of radical surgery should be revived to play a far larger part in the treatment of cancer of the cervix uteri, now that radiosensitivity or radio-resistance of tumours could be assessed with some certainty and cases could be more accurately selected for surgery or irradiation, were remarkable.

H. Braunschweig (U.S.) and his imitators achieved the survival for months and years in comparative comfort of patients subjected to extirpation for recurrent or widespread cancer of the pelvic organs.

It was stressed by H. Barns that diabetes in pregnancy was still taking an enormous toll of fetal life—55% in his series—although the immediate and remote prognosis for the mother was excellent. J. A. L. Gilbert and D. M. Dunlop in Edinburgh showed, in addition, that the overall fetal loss rate in the pre-diabetic pregnancies was as high as twice the non-diabetic control rate; the maximal pre-diabetic fetal loss rate occurring in the two years immediately before the diagnosis of diabetes was made was then six times the control rate. The good results claimed by P. White in 1947 for hormone therapy in diabetic pregnancies had not as yet been repeated in any large scale trial. Nor, as yet, had there been any reported adequate repetition of the work of O. W. and G. V. S. Smith, reported in 1948, on the successful treatment with stilbestrol of habitual abortion and its familiar development, toxemia of pregnancy.

G. M. Bull and his colleagues elaborated the conservative treatment of anuric uremia, by which a large proportion of these desperately ill patients recovered completely. Since the greatest number of their cases were of mismatched blood transfusion after delivery or miscarriage, or of post-abortal shock or sepsis, or of poisoning by abortifacient drugs, his methods—dietetic control and control of water balance—should be of greatest interest to obstetricians and gynecologists. The use of the newer anti-histaminic drugs to control vomiting of early pregnancy was now well established.

HAAKON VII (CHRISTIAN-FREDRIK-KARL-GEORG-WALDEMAR-AXEL) King of Norway (b. Charlottenlund, Denmark, Aug. 3, 1872), was elected King by the Norwegian Storting on Nov. 18, 1905. (For his early life see Encyclopaedia Britannica and Britannica Book of the Year 1949).

On June 7, 1949, he entertained at Oslo Admiral Sir Rhoderick McGirr, who commanded the British 1st cruiser squadron which, four years before, brought him back to his capital. On Aug. 3, celebrating his 77th birthday, he returned to Oslo from a trip in the royal yacht "Norge"—bought by the Norwegian people as a gift to the King on his birth day. He spent the day quietly with the family at Bygdoe Kongsgaard, his estate on the outskirts of the capital.
HEART DISEASES—HEUSS

The high value of the Philippine currency made it extremely difficult for countries in the sterling area and for "soft-currency" countries to buy Manila hemp. Therefore, the main commodities used by hemp spinners were Italian soft hemp and East African sial, the principal hard fibre.

The Italian crop in 1949 was about the same as in 1948 but better in quality. The yield per acre was lower than in 1948 owing to bad weather conditions in most areas. A larger acreage made up the deficiency in the yield. Exports both to Western Germany and to Great Britain increased.

Nevertheless, hemp supplies for the British industry were still insufficient, especially in Manila hemp; but great progress was made in manufacturing cordage from other fibres.

The price level of hemp in world markets during 1948 and the beginning of 1949 was relatively higher than that of other textile fibres and the British government continued to supply sial to British spinners at a fixed price, lower than world parity. The United States government acquired during that period 14,000 tons of East African sial for stockpiling purposes but the U.S. industry itself purchased less in 1948 than during 1947.

Under the European Recovery Programme the O.E.E.C. allocated a sum of $14 million for purchases by France, Belgium, Denmark, Germany, Italy, the Netherlands and Norway of hard fibres from the Philippines and other Latin American countries during the period from April 1948 to March 1949.

HESS, WALTER RUDOLF, Swiss eye and brain specialist (b. Frauenfeld, Switzerland, March 17, 1881), was educated at the universities of Lausanne, Berne, Kiel, Berlin and Zurich and obtained his doctorate of medicine in 1906. From 1917 he was director of the Institute of Physiology at Zurich university and from 1931 to 1936 was also director of the scientific station, Jungfraujoch. In Aug. 1938 he presided over the 16th International Congress of Physiology which was held that year in Zurich. On Oct. 27, 1949, it was announced he had been awarded, jointly with Professor A. E. Moniz (g.v.), the 1949 Nobel prize for physiology and medicine for his discovery of the functional organization of the middle brain in co-ordinating the activity of the internal organs.

HEUSS, THEODOR, German statesman (b. Brackenheim, Württemberg, Jan. 31, 1884), studied at the universities of Munich and Berlin and in 1905 obtained his doctor’s degree in political science at Munich. He joined the editorial board of Friedrich Naumann’s Liberal weekly Die Hilfe (1905-12) and later was the editor of the Neckar-Zeitung at Heilbronn (1912-18). In 1920 he was appointed as lecturer at the newly founded democratic German Political high school in Berlin. He joined the Democratic party and was elected a member of the Reichstag in 1924. He failed at the election of 1928 but was re-elected in 1930, twice in 1932 and on March 5, 1933. With all other members of the Reichstag, Social Democrats excepted, he voted in favour of giving Hitler full powers on March 23, 1933. Soon afterwards his 20 books (including Hitler’s Way, published in 1932) were among those which were publicly burnt in Berlin. After the dissolution of the Reichstag in Oct. 1933 Dr. Heuss went to Heidelberg where he edited Die Hilfe until its suppression in 1936. After the capitulation of Germany in 1945 he obtained from the U.S. military government the licence to publish the Rhein-Neckar-Zeitung in Heidelberg. In 1948 he was elected chairman of the F.D.P. (Freie Demokratische Partei), and he was a member of the Parliamentary council in Bonn (Sept. 1, 1948-May 23, 1949) that drew up a constitution for Western Germany. On Sept. 12, 1949, he was...
HIROHITO—HISTORICAL RESEARCH

HIROHITO, emperor of Japan (b. Tokyo, April 29, 1901), succeeded his father on Dec. 25, 1926. (For his early life see Encyclopædia Britannica and Britannica Book of the Year 1949.)

In Jan. 1949 it was disclosed that the U.S. joint chiefs of staff had given General Douglas MacArthur secret orders that Emperor Hirohito should not be prosecuted on any war crime charges. It was also disclosed that all Japan’s World War II enemies, including the U.S.S.R., had agreed in 1945 to exempt Hirohito in order to facilitate Japan’s surrender and occupation. However, Sir William Webb of Australia, who presided at the Japanese war crimes trials, asserted that Hirohito should be tried. In Sept. 1949 it was disclosed that Hirohito had written a book about one of his hobbies, the study of deep-sea life; the volume was reported to be on the subject of sea horses.

HISTORICAL RESEARCH. In the western world the slow process of bringing together again historical scholars continued in 1949 despite all difficulties. The International Committee of Historical Sciences was re-established in new quarters in Paris and through its national committees organized successful conferences at Oxford, Paris and Rome. Publication of the 1947 volume of the International Bibliography of Historical Sciences (Paris) was announced—the first to be issued since the 1938 volume. Another prewar organization, the International Institute of Political and Constitutional History, resumed its activities in Paris and held a plenary session at the Sorbonne in the spring. The institute’s journal, the Revue d’histoire politique et constitutionelle, also reappeared. French historiography as a whole was thriving, with the issue of important monographs in many fields, as well as useful bibliographies and guides to manuscripts. An outstanding work was R. Doucet’s masterly study of Les Institutions de la France au XVIe siècle (Paris). For more recent history the Actes du Congrès historique du centenaire de la Révolution de 1848 (Paris; Presses universitaires de France) contained some striking papers read at the celebration in 1948.

Over the border in occupied Germany the picture was not so rosy. Yet here too, despite the loss, displacement or removal of so many German archives, a new periodical devoted to the science started at Düsseldorf: Der Archivar, successor to the prewar Archivalische Zeitschrift. Even more significant, the great Historische Zeitschrift came out again in two thick numbers, the first to appear since 1943. Under the editorship of Walter Holtzmann and Gerhard Ritter a comprehensive bibliography of German historical studies during and after World War II was prepared. In Austria the Staatsarchiv in Vienna was showing renewed activity with its new periodical, the Mitteilungen des österreichischen Archivs, entering on its second year. Among other publications of value to students of palæography and history was a well-produced selection entitled 1,100 Jahre österr. und europ. Geschichte in Urkunden und Dokumenten des Haus-, Hof- und Staatsarchiv. Italy was slower in recovering but began to publish at Rome, under the editorship of F. Chabod and others, a series of source-books for the period 1860 to 1943. In Spain and Portugal, notably at Seville and Coimbra, scholars were finding escape from modern politics in the editing of mediaeval texts. At the other end of Europe, amid a wealth of propaganda masquerading as history, a few writers of integrity sought to maintain objectivity in such journals as the Revue d’histoire comparée, issued by the Danubian institute at Budapest, and the Annales d’histoire du droit, an excellent new Polish periodical published at Poznań. In the U.S.S.R. the five-year plan for historical studies entered its fourth year a long way behind schedule. This was not surprising as the scheme launched in 1946 aimed at nothing less than the re-writing of the history of the world according to strict Marxist-Leninist principles. Among the works of international interest issued in 1949 were V. F. Semyonov’s Enclosures and peasant movements in England in the 16th century. A valuable new source for European history was a selection of documents from Russian military archives on the Seven Years War, 1756-63, edited by N. H. Koroskov. Rather more suspect was the selection of Documents and materials relating to the Eve of the Second World War, 1937-39, vols. 1 and 2 (English trans., London), issued by the Ministry of Foreign Affairs of the U.S.S.R. and partly based on captured German material.

Across the Atlantic, activity ranged over the whole field of history, ancient, mediaeval, modern and contemporary. Besides various schemes sponsored by the Mediaeval Academy of America, the University of Pennsylvania launched a co-operative History of the Crusades (Philadelphia, Pennsylvania), the first volume of which was brilliantly executed by Professor J. L. La Monte. The American Historical association carried further various enterprises, such as a revised listing and indexing of British parliamentary papers and the library of congress continued the microphotography of materials relating to American history in European archives. The Pan-American union started an important new periodical called Americas (Washington, District of Columbia), an illustration of the growing attention paid in the United States to the history and culture of Latin America.

Much energy was directed on both sides of the Atlantic to various schemes for editing documents dealing with the origin and progress of World War II. More than 20 volumes were added to the printed evidence of the Nuremberg trials. The captured archives of the German Chancellery and Foreign Ministry provided the material for volumes 1 and 2 of series D of the Documents on German foreign policy, 1918-1945 (London). These volumes were edited by a joint American, British and French committee and dealt with the years 1937 and 1938. Two further volumes of the E. L. Woodward and R. D. Butler edition of British documents on foreign policy, 1919-1939 (London) appeared during the year: first series, volume 3, for the year 1919, and third series, volume 2, for the year 1938. No official histories of World War II itself appeared in Great Britain except W. K. Hancock and M. M. Gowling’s introductory volume to the civil series, entitled British War Economy. The United States Department of the Army brought out volume 1 of the War in the Pacific (Washington, D.C.), dealing with Okinawa, and volume 2 of the series on The Army Air Forces in World War II (Washington, D.C.).

As regards Great Britain, historical studies were flourishing at the universities as never before—Oxford, Cambridge and London all had record numbers of research students. Following its establishment in permanent quarters in the University of London central buildings in 1948, the Institute of Historical Research attracted an increased number of scholars from all over the world. The annual Anglo-American Conference of Historians in July was attended by twice as many visitors as that held in 1948. Two further volumes of the large Victoria County History of England were issued by the institute during the year. In November Louis Francis Salzman retired from the editorship after an association with the History dating back to 1904 and was succeeded by Ralph Bernard Pugh. Revived interest in English local history was
a marked tendency of recent years, another manifestation being the appointment of archivists and assistant archivists by one county council or borough after another. The new periodical, Archives (London), started on Lady Day by the British Records association, was expected to co-ordinate much local effort organized by the association, the National Register of Archives and local societies.

Many record publications were issued during the year, including what might be the last volume in the great series of Public Record Office Calendars—the Calendar of Patent Rolls, 1500-63 (London). A fine exhibition of treaties was on view at the Record office in the earlier part of the year, with a valuable catalogue. Another important publication was the introductory part of a new Guide to the Public Record Office, which would gradually supersede Giuseppi’s well-known guide. A documentary series initiated was “Nelson’s Medalaval Classics,” the first volume of which was a new text and parallel translation of the Chronicle of Jocelyn de Brakelond, edited by H. E. Butler, London.

Among secondary works the first volume of J. E. Neale’s Elizabethan House of Commons (London) was universally acclaimed. The most prolific writers were H. Butterfield and A. Aspinall, each of whom produced three works of major significance. The former contributed a provocative study of Christianity and History, a fresh interpretation of The Origins of Modern Science and a highly specialized monograph on George III, Lord North and the People, 1779-80 (London). Professor Aspinall described, from new sources, Politics and the Press, 1780-1850, he edited Home Office papers to show the development of Early English Trade Unions and he threw new light on the regency period with the Correspondence of Princess Charlotte (London). Finally, it was good to see that after the war’s delays, the Royal Historical society’s annual bibliography of Writings on British history had resumed publication, although there were many years of arrears to make up.

(A. T. Me.)

HOCKEY. The International Hockey board made important changes in the rules of the game during 1949. These changes concerned principally offences under rule 10 (obstruction, rough play, etc.), rule 16 (corner) and rule 17 (penalty corner). In each case umpires were given power to impose more severe penalties than formerly for offences considered to be deliberate or persistent, the object being to check any tendency to obstructive or dangerous play. In addition the I.H.B. recommended that “an experiment be made with an enlarged circle of 16 yd. (instead of 15 yd.), and that all grounds be marked accordingly.” These changes were not adopted officially in women’s hockey, in which the rules differ somewhat from the men’s game.

Ireland won the international championship, beating Wales 5-1, Scotland 4-0, and England 3-2. England defeated Wales 7-0 and drew with Scotland 0-0. Final positions:

(R. L. Hs.)

HOLLAND: see Netherlands.

HOLLAND SIDNEY GEORGE, New Zealand statesman (b. Greenlade, New Zealand, Oct. 18, 1893), was educated at Christchurch West high school, started work at 15 and served in World War I. A business man and farmer, he successfully contested his father’s seat of Christchurch north in the House of Representatives in 1935. He was re-elected for the same constituency in the general elections of 1938 and 1943, and for Fendalton in 1946 and 1949. A member of the National (conservative) party he was elected its leader and also leader of the opposition on Nov. 26, 1940, succeeding to the office of H. B. Hamilton, who was a member of the war cabinet. In the general election on Nov. 30, 1949, the National party obtained 46 seats in a house of 80 members and thus brought to an end the Labour party’s 14-year period of office. After the poll he declared that close and enduring relationships with Britain and the other countries of the British empire would be one of his governing principles. The governor general, Sir Bernard Freyberg, invited him to form a government and he was sworn in as head of the 42nd New Zealand ministry on Dec. 13. He took the portfolio of minister of finance in addition to the premiership.

HONDURAS. A republic of Central America bounded on the E. by Guatemala, on the S. by El Salvador, the Pacific ocean and Nicaragua and on the N. by the Caribbean sea. Area: 59,160 sq. mi. Pop.: (mid-1949 est.) 1,325,936, about 87% being mestizos, that is, Indians with an admixture of Spanish blood; there are also over 105,000 tribal Indians; on the Atlantic coast there are over 24,000 Negroes, of whom 3,000 are British subjects; the white population is less than 2%. Chief cities (pop., 1949 est.): Tegucigalpa (cap., 62,263); San Pedro Sula (24,425); Comayaguela (16,907). Religion: Roman Catholic. Language: Spanish, but unknown to thousands speaking only Indian dialects. President, Juan Manuel Gálvez.

History. The year 1949 opened with the country’s first new president since 1933, when Gálvez took over the government. In his inaugural address on Jan. 1, he renewed his campaign pledges to support agriculture, the electrification programme, the tourist trade, improvement of education, road building and hemispheric co-operation.

The country’s first national income tax, with rates graduated up to 15%, was enacted by the congress in a special session in October; and proposals to set up a central bank were bound over to the regular session in December. In the face of considerable popular opposition the government in November approved a contract with the Tela Railroad company (a subsidiary of the United Fruit company) for a 25-year concession for the development of cacao, palm oil and abacá fibre plantations in Honduras.

Plans were announced by the Standard Fruit and Steamship company for the re-opening of banana plantations in the Trujillo and Puerto Castilla districts. Work was begun during the summer on a $200,000 project to pipe 26 million gal. of water daily to Tegucigalpa from a distance of 11 mi. Education. Schools (1949): primary 1,700, pupils 83,619; secondary 27, pupils 1,340; normal 24, pupils 1,541; commercial 14, pupils 1,073. The National university enrolled about 500 and the Pan American School of Agriculture, 171 students.

Foreign Trade. Exports during the year 1947-48 amounted to U.S. $19,128,342; imports, $34,905,933. The U.S. supplied 79% of the imports. The chief exports were: bananas, tobacco, unrefined silver, coffee and coconuts.

Communications. In 1947 the banana area of the north was served by 922 mi. of railway; the main towns by 1,201 mi. of highway and 617 mi. of surfaced. Public telephone lines measured 2,646 mi. There were six radio broadcasting stations in 1948. At the end of 1948 there were 959 private cars, 976 lorries and 26 buses registered.

Finance. The monetary unit is the lempira, officially valued (Nov.
HONG KONG—HORSE RACING

15, 1945) at 49-02 U.S. cents. Budget: (1948-49 est.) expenditure 21,488,662 lempiras; (1949-50 est.) expenditure 20,244,162 lempiras. On Dec. 31, 1948, total money in circulation amounted to 16,738,573 lempiras. At the same time the foreign debt stood at 1,762,516 lempiras.

M. L. M.

HONDURAS, BRITISH: see BRITISH HONDURAS.

HONG KONG. British colony on the coast of China consisting of the colony (Hong Kong island, the ceded territory of Kowloon and Stonecutter's island) and the New Territories (the remainder of the Kowloon peninsula and numerous islands) leased from China in 1898 for 99 years.

Area: colony 36 5 sq. mi., New Territories 355 sq. mi. Pop. (mid-1949 est.): 1,857,000. Executive Council: seven official and four (two of whom were Chinese) unofficial members; Legislative Council; nine official and eight nominated unofficial members, at least three of whom would be Chinese. Governor, Sir Alexander Grantham.

History. Proposals for the institution of a municipal council partly chosen by popular election and for the reduction of the official membership of the Legislative Council to seven, giving an unofficial majority of one, which had been approved and were expected to come into effect in 1948 were, in fact, postponed. In 1949 new proposals were put forward with the unanimous support of the unofficial members of the Legislative Council; they involved the deferment of the municipal council proposals and the reconstitution of the Legislative Council on broader lines and with some popularly elected members (the numbers suggested were 11 unofficial and 6 official members).

But the position in Hong Kong during the year was dominated by the sudden successes of the Communist regime in China. British military reinforcements were despatched as a precaution against possible incidents. The defences were strengthened and in June the minister of defence, A. V. Alexander, visited the colony for defence talks. With the capture of Canton by the Communists, the operation of the Canton-Kowloon railway was temporarily suspended.

The nature and scale of the colony's trade made difficult the application of the strict exchange restrictions in force elsewhere in the sterling area; and in April the government banned all dealings in and the possession of gold without the express permission of the governor as, in spite of rigid import and export regulations, there had been an active gold market with prices well above those laid down by the International Monetary fund.

The long-awaited report by Sir Patrick Abercrombie, the town planning expert who visited Hong Kong in Nov. 1947, was released in September. He recommended, *inter alia*, a tunnel between the island and the mainland, a realignment of the railway and the move of the armed forces from their present quarters in the centre of the city.

**Finance and Trade.** Currency: $1 = 1s. 3d. Budget (1948): Revenue $136,093,240; expenditure $113,960,826. Foreign trade (1948): imports $2,077,538,615; exports $1,582,739,710. (J. A. Hu.)

HOPS. The 1949 crop consigned to the Hops Marketing board was 151,500 pcketons as compared with 167,736 in 1948. The estimated market demand for 1949 hops by brewers (some of whom grew their own hops) was fixed at 247,000 cwt. It was doubtful whether the 1949 crop would come within 20,000 cwt. of that total and brewers' contracts were scaled down to 89% of their estimated requirements. Having regard to the decline in beer consumption, however, the percentage allocated to brewers would be sufficient for a year's production at the existing rate.

The hot, dry summer was responsible for the crop being smaller than in 1948, the cones being unusually small; but it also resulted in a crop well above average in quality. Hops in general were greener than usual, possibly owing to lack of rain, but in most cases were fully ripened.

In the 1949 season the responsible and complex task of assessing the cost of production per cwt. of hops, on which the average price to be paid by the brewer was based, was being undertaken by the specialized staff of the Joint Hops committee and not, as heretofore, by the staffs of Wye college and Bristol university.

Early in the year the Permanent Joint Hops committee decided that the average price of the 1948 crop should be £25 15s. a cwt. as compared with £23 10s. a cwt. for the 1947 crop. Against the total contracts of 275,023 cwt. the crop consigned to the board amounted to 255,903 cwt., and contracts were fulfilled up to 88%. The acreage under hops, including headlands, was 22,638 ac.

Several firms of merchants were striving to establish abroad new markets for English hops. This would be a development of unquestionable value for the export trade and therefore in the national interest. It might also serve to provide a useful "cushion" against the effects of exceptionally good or bad seasons so far as the home market was concerned. (See also BreWing AND BEER.)

HORSE RACING. The National Hunt season in Great Britain and Ireland was favoured with a mild winter in 1948-49; the only race of importance to be affected by frost was the Cheltenham Gold cup, postponed from March to April. The winner, as in 1948, was F. L. Vickersman's Cottage Rake. The Champion Hurdle cup was won by Hatton's Grace, ridden, like Cottage Rake, by A. Brabazon and prepared with the damaged hull of H.M.S. *Amethyst* as seen at Hong Kong where she arrived on Aug. 3, 1949, after escaping from the Yangtze where she had been held from April 20.
Dake won the French Two Thousand guineas in May and Good Luck the Prix du Jockey club a month later. The Grand Prix de Paris, run three weeks after the English Derby, went to a filly Bagheera, with the English-trained Royal Empire second and Amour Drake third.

The autumn did not, as in 1948, bring brilliant but hitherto backward horses to the head of the three-year-old field, for there was nothing to suggest that Ridge Wood, winner of the St. Leger, or Ciel Etoile, who won the French equivalent, were of any great merit. Ridge Wood was beaten in the King George VI stakes at Ascot by Boussac's Marvel.

Despite the mediocrity of the colts, the fillies were in general well behind them; an exception was, of course, the Grand prix winner Bagheera, and no less important, Boussac's Coronation V, who won the French Thousand guineas in October the Prix de l'Arc de Triomphe, in 1949 worth Fr. 3,000,000 or about £30,000, and thus one of the richest races ever contested. Coronation V was the result of a bold experiment in inbreeding, for both her sire and dam were by Tourbillon. She had, however, run without success in the Epsom Oaks, won like the Thousand guineas by Musidora, and had been beaten in the Irish Oaks by Circus Girl. The Irish Derby was won by the Aga Khan's English-trained Hindostan and the Irish St. Leger by Brown Rover, also trained in England, after the disqualification of Moondust.

If the three-year-olds were moderate, there were some exceptional horses a year older. Black Tarquin, winner of the previous year's St. Leger, won several races early in the season, but had to bow in the Ascot Gold cup before Lord Derby's Alycidon, generally considered one of the finest stayers of his time. Alycidon also won the Goodwood and Doncaster cups and was the first horse to win all three races since Isonomy in 1879. J. B. Townley's Sterope, ridden by E. C. Elliott, won the Cambridgeshire stakes for the second year in succession, being the third horse to do so.
With the exception of the three-year-old Abernath there were no outstanding sprinters, and no two-year-olds gave any indication that they would hold exceptional chances in the next year's classic races. One of the features of the two-year-old racing was the unusual success of those raced in England by the Aga Khan, for they won in stake money a total of some £40,000. In France the filly Corejeda, yet another high class winner belonging to M. Boussac, appeared the best of her sex and in October defeated the best English filly Diableretta at Newmarket. (M. A. Me.)

United States. The year was a memorable one although attendance and totalizer figures continued to drop for the third year in succession. Despite reduced expenditure at race-courses the season proved a financial success and as 1949 ended official figures were expected to show that nearly $1,400 million had been spent on bets and that attendance was nearly 23 million.

The Kentucky Derby at Louisville, Kentucky, on May 7, proved to be one of the season’s major surprises when Ponder, after getting away from a slow start, worked his way up the field to lead home 14 rivals. Ridden by Steve Brooks, Ponder at 16 to 1, won by three lengths, with Capot, “the horse of the year,” second and Isador Bieber’s Palestinian third. F. W. Hooper’s favourite Olympia was sixth. In the Preakness Stakes at Pimlico, Baltimore, Maryland, on May 14, Capot created a new course record, winning by a head from Palestinian. Noble Impulse, owned by Crispin Ogleby, was third, Mrs. E. H. Elliston’s Sun Bahram was fourth and the favourite, Ponder, fifth. With jockey Ted Atkinson up, Capot covered the mile and three-sixteenths in 1 min. 56 sec. Coaltown, despite his 1 min. 34 sec. world mile record in the Whirlaway Stakes proved no match for Capot who won the Sysnoby Mile and the Pimlico Special easily.

Ponder’s $321,825 prize money made him the year’s leading money winner in U.S. racing. Capot, Ponder, Palestinian and Olympia were the best of a fine crop of three-year-old colts and Calumet’s Wistful and Two Lea led the three-year-old fillies. Hill Prince, Guiltline and Middleground shared the big events for two-year-old colts. The Calumet Farm’s string of horses again won more than $1 million, outstanding all its rival stables, Willie Molter was the leading trainer, saddling the most winners, and Gordon Glisson was generally acknowledged as the outstanding jockey of the season. (T. V. H.)

HORSES: see LIVESTOCK.

HORTICULTURE. The year 1949 would long be remembered by horticulturists, particularly those in the south of England, as the year of the great drought. While some sun-loving plants flourished more finely than in a normal year, many others particularly in such genera as Meconopsis, Gentiana and Primula suffered severely and the stock of many difficult and rare species were sadly diminished.

A Rhododendron conference, originally arranged for 1940 but postponed owing to the war, was held in April 1949 under the auspices of the Royal Horticultural society. London. Six papers were read to the conference and were subsequently reprinted in the society’s Rhododendron Year Book 1949. The conference provided the occasion for a special show of rhododendrons and for a ten-day tour for enthusiasts of the genus round the most famous rhododendron gardens of the southern and western counties.

The Joint Gardens committee of the National Trust and the Royal Horticultural society made further progress during the year and announced that the gardens at Hidcote manor in Gloucestershire and the famous gardens at Bodnant in North Wales had been presented to the National Trust for control by the committee through the kindness of Major Lawrence Johnston and Lord Aberdeen respectively. An article by V. Sackville-West on the garden at Hidcote appeared in the Journal of the R.H.S. (Nov. 1949) and a general article by the Earl of Rosse on the scheme was published in October in the same journal.

During the year the Royal Horticultural society supported plant hunting expeditions to central Bhutan by Major G. Sherriff and F. Ludow, to Nepal by Oleg Polunin and to the mountains of southwest Anatolia in Turkey by Peter Davis, and a rich harvest of seeds was obtained. These were being raised at the gardens of the society at Wisley and at other establishments throughout the country.
